Dedicated to the memory of Dr. Donald E. Worcester, distinguished professor, scholar, mentor, and friend

About the Editors

Spencer C. Tucker, PhD, held the John Biggs Chair of Military History at his alma mater, the Virginia Military Institute in Lexington, for 6 years until his retirement from teaching in 2003. Before that, he was professor of history for 30 years at Texas Christian University, Fort Worth. He has also been a Fulbright scholar and, as an army captain, an intelligence analyst in the Pentagon. Currently the senior fellow in military history at ABC-CLIO, he has written or edited 25 books, including the award-winning *Encyclopedia of World War II*, *Encyclopedia of World War II*, and *Encyclopedia of the Cold War*, all published by ABC-CLIO.

James Arnold is the author of more than 20 military history books and has contributed to numerous others. His published works include *Jeff Davis's Own: Calvary, Comanches, and the Battle for the Texas Frontier* and *Napoleon Conquers Austria: The 1809 Campaign for Vienna*, which won the International Napoleonic Society's Literary Award in 1995.

Roberta Wiener is managing editor for the John A. Adams Center for Military History at the Virginia Military Institute. She has written *American West: Living the Frontier Dream* and coauthored numerous history books for the school library market, including *Robert Mugabe's Zimbabwe*.

Preface

The Encyclopedia of North American Colonial Conflicts to 1775 is one of 14 projected multivolume works in the Encyclopedias of American Military History series, tracing the entirety of U.S. military history. Each of the sets addresses a particular war or period and contains both individual entries and a volume of documents.

This encyclopedia is, of course, the first in the series, and in it we cover nearly three centuries of North American history. We have many entries treating the first Americans—the Native Americans—and have included not only entries on their key leaders and tribes but also essays treating their methods of warfare and weapons. The majority of entries are those devoted to the English and French colonies and the struggle between these two national blocs which dominated much of the period. We have not, however, neglected the Spaniards, the Swedes, the Dutch, and the Russians, all of whom made major contributions to America's heritage. Even in an encyclopedia of more than half a million words it is impossible to include every individual, battle, or event, but we have endeavored to include the most influential. We have also included entries treating technologies of the era, such as cannon founding, shipbuilding, and weaponry, bows and arrows, and muskets.

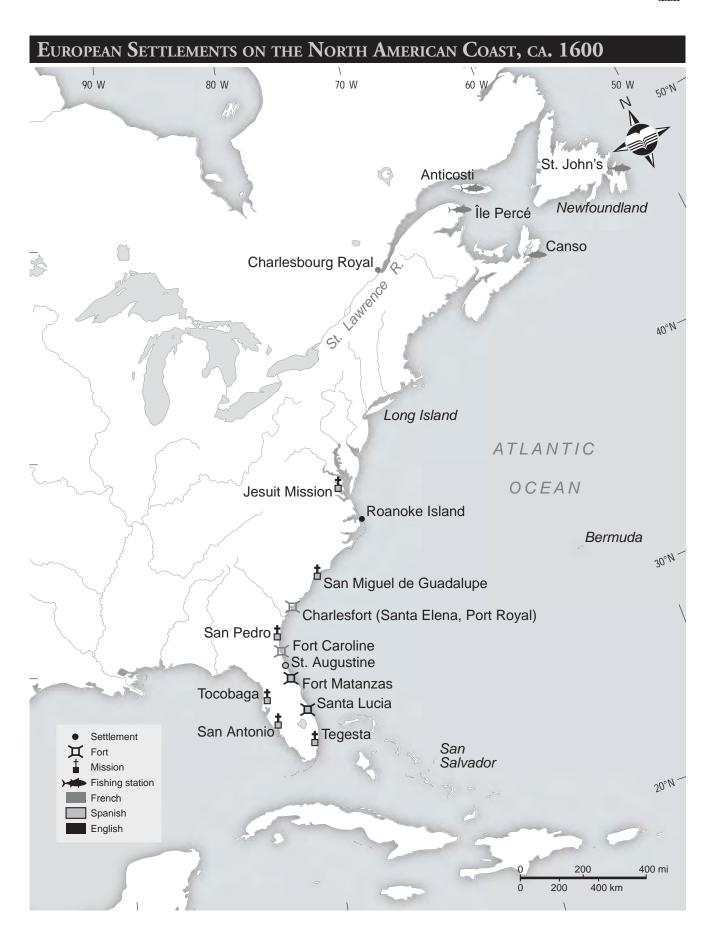

While the colonial period is marked by important diplomatic and military events, it also shaped the lives of the people who lived through it in many other ways. We have sought, therefore, to address not only military, political, and diplomatic events but also social and economic issues. We have entries on religion and on religious leaders, medicine, and economic and political theories and theorists.

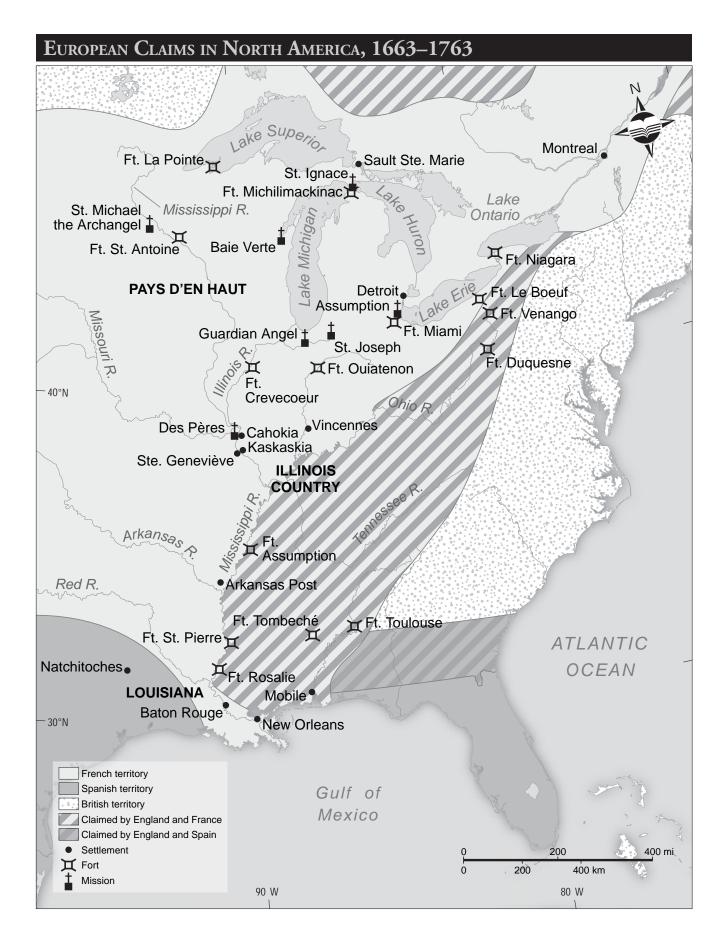

Members of the Editorial Advisory Board and individual contributors suggested additional entries, and we have tried to incorporate as many of their ideas as possible. We have also included a selected bibliography and a glossary, along with a good many maps, which we believe are essential, especially to understanding geopolitics and battles.

Such a wide-ranging project as this rests on the work of many different people. I am grateful to all of the contributors, especially to the large number who answered one or more appeals to take on additional entries when other contributors fell by the proverbial wayside. Members of the Editorial Advisory Board were also most helpful in going over the entry list and suggesting potential contributors. Assistant editors Dr. Justin Murphy and Dr. Jim Piecuch read the entire manuscript and helped catch errors of fact and interpretation. Roberta Weiner and Jim Arnold wrote a number of entries and put together the documents volume. I am, however, most grateful to my esteemed colleague, Associate Editor Dr. Paul G. Pierpaoli Jr., who helped me with the oft-challenging first-pass editing and wrote many entries. We work together remarkably well. Special thanks are due to the good folks at ABC-CLIO, including Editorial Operations Manager Kirk Werner and Project Editor Andrew McCormick for their aid and encouragement in myriad ways. I am especially appreciative of Becky Snyder, president of ABC-CLIO, for her unflagging support, her vision in recognizing the need for students to study military history, and her advocacy of this series of encyclopedias. Finally, I would also like to thank my wife, Dr. Beverly Tucker, for her continued patience and understanding.

Introduction

The Encyclopedia of North American Colonial Conflicts to 1775 is the first in a series of 14 multivolume encyclopedias being published by ABC-CLIO that trace the military history of the United States to the present. This three-volume work covers by far the longest time span, beginning more than six centuries ago and extending over nearly three centuries until the beginning of the American Revolutionary War in 1775.

In many ways the colonial period seems hopelessly remote today, and yet it shaped the United States in fundamental ways. To some extent, American attitudes toward the military were conditioned by those of the mother country, as in the English fears of standing armies, but events in colonial America solidified such sentiments. Because regular troops were not available in large numbers, both New France and the English colonies embraced the concepts of militia service and the citizen soldier, which greatly influenced subsequent patterns of U.S. military service. The special conditions of North America and the vast distances that separated colonists from their mother countries also ensured that institutions and attitudes evolved differently. Our fundamental attitudes toward government were directly shaped by this period.

Of course, the key conflict woven through much of this period is the struggle for supremacy in North America. In the beginning this was a struggle among the first Americans, the Native Americans. The Spaniards were the first outside power to attempt to control the continent, but it was the French and the English who, establishing their permanent settlements about the same time, were the chief rivals for continental supremacy. This is a colorful story, one that has captured the American imagination and is the subject of great literature and film. The contest for continental supremacy ended, for all intents and purposes, in the most impor-

tant battle in the history of North America, on the Plains of Abraham outside of the city of Quebec on September 13, 1759. Although the French, who enjoyed the support of most Native Americans, fought hard and well, the century-and-a-half struggle for control of North America was almost certain to end in English victory, especially given the vast disparity in colonial populations and the British Navy's control of the sea for much of the period. The battle for Quebec all but sealed English control of the continent.

Why study the colonial period? It is, of course, full of colorful events and people. But more important, a knowledge of American history in this period is essential in understanding who we are as a people. In this period, Americans, be they French, English, Spanish, Swedish, or Dutch, were separated from their mother countries by the vast expanse of the Atlantic Ocean. Faced with this and other unique challenges presented by North America, they developed the attitudes and beliefs that would find expression in the American Revolution. Among these were notions of what constituted the correct form of government, including beliefs in popular representation, the separation and balance of powers, and a wider franchise, as well as ideas that later found expression at the state level in the initiative, referendum, and recall. The difficulties of frontier life and the fact that there was no native nobility in America helped foster concepts of equality and encouraged the play of individualism and advancement by ability. The fact that Americans came from many levels of societies and different nations contributed to the precept that America was a "melting pot" of peoples. In education, Americans believed in public control. Attitudes toward religion underwent dramatic change, from intolerance to tolerance and a generally held belief in the separation of church and state. Some colonies were expressly founded with the notion of extending religious freedoms,

xlii Introduction

and these ideas resonated beyond those colonial borders. Unfortunately, there was also a darker side to the period, of perceived racial superiority, the ritual torture of captives, the execution of innocents, and the enslavement of other human beings. While slavery did not originate in the colonial period, sadly it did not end with it, or even with the U.S. Constitution of 1789.

In all, learning about the colonial period is essential to understanding who we are as a people today. It is also an exciting period to study, and all those who have labored on this project hope that this encyclopedia has contributed to our knowledge of this important period.

Spencer C. Tucker

Overview of the North American Colonial Period

This summary provides both background and context to the entries and essays that follow. It is difficult, if not impossible, to cover linkages and interconnections among the numerous events, places, and themes in the separate entries of an alphabetically arranged encyclopedia. On the other hand, the many entries that follow provide both details and nuances that cannot be covered here.

The Clash of Cultures

The colonial period, from the 16th century until the beginning of the American Revolutionary War in 1775, involved the conflicts of the many peoples in North America, principally in what is now the eastern United States and eastern Canada. In earlier decades, those conflicts were often between Native Americans and European explorers, settlers, and soldiers. Equally important were the conflicts among the various groups of Native Americans, who did not begin to see themselves as a single people, or even as a group of peoples with related interests, until the mid-18th century, toward the very end of our story. Conflicts between Europeans and American Indians often included some Native American groups on both sides, and the interests being defended or advanced were an evolving combination of settler and native goals.

Conflicts among Europeans occurred in this earlier period, but they were relatively rare and quick. After 1689, conflicts among Europeans increasingly predominated, at least in the European perspective. These struggles usually involved the colonies of France and Great Britain, with an occasional clash with Spanish Florida. Prior to 1754, these conflicts were generally extensions of wars begun in Europe, fought for European reasons, and then concluded with European interests in mind.

North American colonists, especially British settlers, gave the wars different names, reflecting their ignorance of, or indifference

to, the official casus belli. Even the accepted chronologies reflect their European origins. For example, the Seven Years' War, which actually had roots in the New World, officially began in 1756 and ended in 1763, but the fighting in North America, where the conflict was known as the French and Indian War, commenced in 1754 and for all intents and purposes concluded in 1760.

Settlers, colonial governments, and Indian nations grafted their own perceptions, experiences, and interests onto those of the European powers. Conflicts between colonies, between Native Americans and settlers, and among NativeAmericans were all superimposed on the European-based pattern.

The Establishment of European Colonies

European sovereigns of the 15th to 17th centuries had no qualms about claiming jurisdiction over any lands encountered by their navigators, as long as no other "Christian prince" had claimed them. They assumed that the newly discovered lands would somehow further the power, wealth, and well-being of the mother country. The European powers, already engaged in long-term rivalries at home, tended to be jealous of one another's gains, including their colonial gains, and fearful of advantages that might accrue to their rivals from them.

The legal basis for monarchs' initial claims was the right of discovery, although the claims generally extended well beyond lands the discoverers had actually seen. Prudent sovereigns ordered the establishment of forts, trading posts, or settlements to strengthen their claims on the basis of the right of occupation. In practical terms, the claims were also based on their possession of long-distance sailing vessels, professional armies, firearms, and horses, all of which were new to America, and, with the exception of horses, relatively recent innovations in Europe.

From the European perspective, the presence of a non-Christian population did nothing to weaken claims, although for some it created a moral obligation to bring the "savages" to the "true religion." The lives and cultures of the native peoples—termed "Indians" by the discoverers, who rather seriously miscalculated where they were—would be profoundly changed in endless ways. Novel European trade goods, such as iron cooking implements, knives, cloth, firearms, and alcohol, transformed the lifestyles of the Native Americans, who quickly formed a previously unknown dependency on outside suppliers.

To acquire trade goods, Native Americans devoted their lives to trapping and the accumulation of animal furs and skins to an unprecedented degree, and they engaged one another in wars over hunting grounds and trading rights. Their own sense of identity was changed as they converted to new religions or formed new confederations in self-defense. Some linguistic groups (and sometimes even unrelated groups) became self-conscious nations for the first time. Finally, untold multitudes died from wars and even more from contagious European and African diseases to which they had no immunity.

The settlers' treatment of the Native Americans—and the Native Americans' treatment of the settlers—varied from place to place and from time to time. Early contact was often accompanied by mutual caution and suspicion, if not immediate hostility. At some point, relations generally involved large-scale violence.

Although settlers initially feared incursions by European rivals, most of the early conflict occurred between settlers and Native Americans. Often this began with an alliance between a settler group and one Native American nation or confederation against the latter's rivals. (In a twist, Powhatan, the leader of the Powhatan Confederation, apparently tricked the settlers of Virginia into attacking the Chickahominy in 1616, then used the attack as evidence of a threat in order to convince the Chickahominy to subordinate themselves to his confederation.)

Normally, the colonists provided valued European trade goods and military technology; the Native Americans provided manpower, intelligence of the local terrain and inhabitants, and emergency food supplies, which generally meant the difference between survival and extinction for a new colony. On other occasions, however, conflict came as a reaction to offensives or abuses, real or perceived, or out of fear that the other side was preparing to attack. Assaults against Native Americans by the English, in particular, were often preceded by rumors of Indian conspiracies and impending assaults, for which substantiation was rarely provided. New England Puritans often accompanied their attacks with denunciations of the Indians' "degenerate" and "heathen" ways.

With time, demographic pressures and the expanding vale of settlement, especially in the British colonies, fueled further conflict as the Indians saw themselves displaced from their native territories. Each side saw its own needs, ambitions, and cultural practices as the more legitimate, and the other's offenses as the more egregious. Eventually, most colonial authorities, although not all,

assumed that Native Americans were both capricious and hostile and that intimidation was the most effective way to deal with them. The precise causes of war, however, especially in the earliest decades, have often been obscured by incomplete, contradictory, and self-serving reports.

The European advantage in weaponry was of greatest utility on open fields or in fights over the control of fixed positions, such as villages or forts. It was greatly mitigated in densely wooded areas, where Native American warriors used the tactics of encirclement and surprise (ambush) to great effect. The European technological edge was lessened by the sale of firearms to Indians; although the latter remained dependent on Europeans for arms and ammunition, they could often rely on the colonies of rival European powers. Colonial forces gradually adapted to ambushes and other Indian tactics, sometimes by mimicking them, other times by countering them, dispersing their forces and paying close attention to their surroundings (frequently with the aid of Indian scouts from rival nations) while seeking to maintain the advantages of European military discipline and organization.

It is worth noting that the "Indian style of fighting" was itself a recent innovation. When Samuel de Champlain first encountered members of the Iroquois Confederation in 1609, for example, the Mohawk warriors fought in the open, in massed formation, wearing wooden armor. Their development of new tactics was a response to European firearms.

New Spain

Spanish colonizers concentrated their attention on the larger Caribbean islands and what would become Latin America, especially Mexico and Peru, where they found the gold and silver they needed to finance a rich court life and powerful fleets and armies in Europe. Spanish expeditions explored parts of North America in the early 16th century, but they concluded that the precious metals were too scarce and the natives too hostile to warrant further interest.

Spanish treasure fleets from the New World became strategic targets for rival European navies. The treasure ships exited the Caribbean through the Straits of Florida, creating a strategic vulnerability in this narrow passage between that peninsula and the Bahamas. France, seeking outposts from which to strike at the Spanish fleets, was the first colonial power to establish small coastal settlements to the north, at Port Royal (Parris Island, South Carolina) in 1562 and Fort Caroline (Jacksonville, Florida) in 1564. Port Royal—not unlike a Spanish outpost on Virginia's York River in the 1570s and English outposts on Newfoundland Island and at Roanoke, Virginia, in the 1580s—failed in part because of hostilities with the local population. Spain responded to Fort Caroline in 1565 by sending an expedition there, wiping out the colony, and founding their own outpost, St. Augustine (San Agustín), on the Florida coast.

The Spanish remained at St. Augustine, the first permanent European settlement in what is today the United States, to assure control of the straits and to serve as a warning to its rivals. Further Spanish expansion into the present southeastern United States was modest, consisting primarily of Indian missions in northern Florida and coastal Georgia, intended in part to supply food and an outer defensive perimeter for St. Augustine. Later, the Spanish built a second military stronghold, at Pensacola. Settlers were few and consisted above all of soldiers and missionaries. Economic development was limited.

Spain also had outposts in the present southwestern United States. These had few encounters with the other European powers, whose presence was initially limited to the East Coast, but they engaged in protracted conflicts with the Indian population, especially in New Mexico.

The Spanish Empire, in decline by the end of the 16th century, began to make seemingly small concessions. In treaties with England (1604) and the Netherlands (1609), Spain required that its monopoly in America be respected only where it maintained effective occupation. Vast stretches of territory now lay open to them, and rival European powers began snatching up the smaller Caribbean islands and establishing colonies on the North American mainland (and even on parts of the South American coast).

Acadia and New France

France, having paused after the failure of the Carolina and Florida colonies, turned its attention north to Canada, far from any effective Spanish occupation. There, the French successfully exploited the rich fishing banks of the North Atlantic and the fur-bearing animals of the Canadian forests. French colonists, while more numerous than the Spanish in Florida, were still relatively few in number, and most were soldiers, former soldiers, or missionaries. Nonetheless, the colonizers collaborated with a network of Indian nations to create a vast fur-trading empire that extended from the Atlantic Coast through the Great Lakes region to Hudson Bay in the north and the Dakotas in the west.

The French were perhaps the most successful in the long-term management of relations with the Native American population. From the time of the settlement of Acadia (1604) and New France (1608) by Champlain, the French made an effort to seek the Native Americans out; to establish missions, forts, and trading posts among them; to assign people to learn their languages and customs; to engage regularly (from the 1640s) in ritualized diplomatic conferences and gift-giving ceremonies; and to keep track of the internal politics and the intertribal relations of the various Indian nations. Having a small population, New France did not strain relations with the American Indians by sending out ever-larger waves of settlers demanding ever-larger swaths of Indian land. In 1627, for example, Virginia had roughly 2,000 European settlers, whereas New France and Acadia combined had 107. By 1740 the British colonies had more than 900,000 settlers; Canada had less than 44,000. French Protestants, known as Huguenots, who were a potential source of large-scale migration, were actually forbidden to settle in New France after 1632 for fear of their disrupting the missionary efforts of the Jesuits. France used its colonies as commercial enterprises and relied heavily on the Native American population to staff the fur trade and to provide much of the military might to secure it, in return for trade goods. Missionaries, in addition to pursuing religious goals for their own sake, were expected to help tie the Native American population to the French cause.

The French thus formed long-lasting alliances with the peoples of Acadia, the St. Lawrence Valley, the Ottawa Valley, and the Great Lakes: the Micmac, the Montagnais, the Algonquins, the Nippisings, the Hurons, the Ojibwas (Chippewas), the Ottawas, the Potawa -tomis, and so on. The Abenaki of what is now southern Quebec and northern New England were also a frequent ally. The Abenaki alliance, shaky at first, was reinforced by the increasingly frequent clashes between the Abenakis and the expanding New England colonies and by the equally frequent wars between the Abenakis and the Iroquois. Factions often formed within these nations over the relative wisdom of allying with the French, forging an accommodation with the English, or seeking a neutral stance. In the case of these nations, the pro-French argument generally held the day.

Often the French were called upon to manage or settle disputes among their allies, and they frequently succeeded. In the process, however, the French and their new allies became entangled in a series of wars with the Iroquois Confederation. The Iroquois were longtime adversaries of several of France's Native American allies. They also rivaled France itself for control of the fur trade.

Between 1640 and 1701, New France and the Iroquois Confederation were at war much of the time. There were occasional truces, especially when the Iroquois were simultaneously fighting the Susquehannocks to their south or the Mahicans and Abenakis to their east. During the more prolonged truces (1653-1658, 1667- 1682), the Iroquois permitted the Jesuits to establish missions in their villages. In 1676 the French established Caughnawaga (now also spelled Kahnawake) in the St. Lawrence Valley, the first village built for Iroquois Catholic converts. These converts, mostly Mohawks, proved to be enduring allies for the French, although they continued a surreptitious trade with Albany and would rarely fight other Iroquois. Much of the politics among Iroquois factions during this period focused on the attitude for the Confederation regarding the French and the British. Starting in 1680, however, the Iroquois initiated a series of raids against the Illinois, a recent French ally in the West, driving the latter further into the arms of the French. This eventually resulted in a return to warfare and the expulsion of the Jesuits.

The 1680s also witnessed the introduction of the troupes de la marine, a regular military force that, like the colonies themselves, was subordinated to the Ministry of the Navy. This force was initially raised in France and stationed in Canada. Many of its soldiers eventually settled there, and replacements were recruited locally. The unit evolved into a force that was more professional than the normal colonial militia, although arguably less so than regular French army troops (troupes de terre). Troupes de la marine were adept at Indian-style forest warfare (the "skulking way of war").

The so-called Beaver Wars with the Iroquois did not always go well for the French and their allies, especially at midcentury. Iroquois raids became especially effective after the 1640s, when the Iroquois gained access to large numbers of Dutch firearms. The Iroquois reduced the once-mighty Hurons to the status of a wandering refugee band. Some remnants of the defeated (especially related Iroquoian groups, such as the Hurons, the Petuns, and the Neutrals) were adopted into Iroquois tribes and settled in special villages; others were dispersed. The Erie essentially disappeared from the historical record. The wars left present-day Ohio and Indiana virtually depopulated for half a century or more. Needless to say, New France suffered as well, and recruiting new settlers became exceedingly difficult during this period.

As a result of their own actions, however, the Iroquois generated the enduring animosity of many peoples over an enormous territorial expanse. The attack launched by the Marquis de Denonville against the Seneca villages in 1687—with 832 troupes de la marine, 1,030 militia, and 300 Native American allies from the east, joined by 160 *coureurs de bois* and nearly 400 Native Americans from the west—was New France's largest military operation until the French and Indian War. Yet it was the Ojibwas and the Ottawas of the western Great Lakes who played the largest role in finally pushing the Iroquois back into their home territory south of Lake Ontario in the 1690s.

Chesapeake Bay and New England

In the first half of the 17th century, Europe was disrupted by major wars, particularly the religion-inspired conflicts of central Europe (the Thirty Years' War, 1618-1648) and the long Dutch war of independence against Spain (the Eighty Years' War, 1568-1648, a wideranging conflict that extended even to Brazil). England took advantage of the continental warfare to establish several colonies along the Atlantic coastline between the territories of France and Spain. The earliest centered on Chesapeake Bay (Jamestown, Virginia, 1607) and New England (Plymouth, Massachusetts, 1620). The English settlers found few precious metals or other exploitable resources apart from furs and deerskins. In the end, however, the English established settler colonies with far larger populations than those of France and Spain. The rapid growth resulted from both high birthrates and large-scale migration, including the migration of dissidents and foreigners: English Puritans, Quakers, and Catholics; the Scots and the Irish; and French and Germans Protestants. Among 18th-century immigrants, both Scots and Germans outnumbered the English.

There were also many unfree settlers: indentured servants, convicts, and, increasingly, African slaves. Enslaved Africans were to be found to some extent in all the colonies, north as well as south. One colony, Georgia, did attempt to prohibit slavery at its inception, but the ban lasted less than two decades.

As with other colonies, the early English settlements often depended on assistance from the local population to survive an initial "starving time." Once they were established, however, their larger numbers made the English settlers less dependent on the Native Americans than were the French for the success of their enterprise. This was particularly true of plantation colonies, for

which the Indians were mere obstacles and rival claimants to valuable lands. (Fur-trading colonies still had use for Native American allies.) Perhaps for this reason, the English colonists made less effort to understand the local peoples. When war broke out, some settlers proved singularly unable, or unwilling, to distinguish among enemy, neutral, and even allied tribes, indiscriminately attacking or retaliating against all Indians.

The early Chesapeake colonists quickly formed an alliance with Powhatan, leader of the powerful Powhatan Confederation, against other Native American groups. Within two years, however, the dispersal of starving colonists looking for food and attempting to establish scattered, self-sufficient settlements led to armed clashes with many local tribes (1609–1614). Relations quickly deteriorated again after Powhatan's death in 1618. Disputes over access to the James River, the appropriation of land for tobacco cultivation, common murders, and the question of proper reciprocal relations—which side was the suzerain and which the vassal—all added to accumulating tensions. The loss of thousands of settlers to epidemics increased the uncertainty of the situation. (In this instance, disease appears to have taken more settlers than Native Americans.)

Warriors of the Powhatan Confederation launched an attack in March 1622 that killed over a quarter of the settler population in a single day. The Virginians surprised their attackers by fighting back instead of leaving, despite further heavy losses due to attack, starvation, and disease. Reciprocal acts of revenge were conducted with comparable ferocity. The devastation brought by the Anglo-Powhatan Wars brought about the bankruptcy of the Virginia Company and the establishment of Virginia as England's first royal colony in 1624.

A truce of sorts took hold by 1632, but fighting continued on and off until 1646. The Powhatans attempted to take advantage of the rivalry between Virginia and the new colony of Maryland, but they failed. Maryland, chartered in 1632, was founded by Catholics but attracted few Catholic settlers; as a result, its Catholic elite ruled over Protestant farmers and indentured servants. The colony got on relatively well with the Native American population but was occasionally attacked in the 17th century by anti-Catholic Virginians. By the end of the conflict, mutual hostility between cultures was a basic assumption, physical separation was ingrained as a norm, and Native American prisoners were routinely sold into slavery in the West Indies.

By the 1670s the Susquehannocks—allies of Maryland who had been engaged in war with the Iroquois Confederation—began expanding from the Susquehanna and Delaware valleys toward areas previously abandoned by the Powhatans. At the same time, tensions were mounting between Virginia frontiersmen on the one hand and the colonial government and the emerging planter elite on the other. The government viewed the frontier settlers, who were also moving into Powhatan lands, as abusive of the Native American population and too quick to start fights they could not win. The frontiersmen complained that the government and elite were too interested in monopolizing the Indian trade, levying excessive taxes

to build ineffective forts, and keeping the common folk in the position of indentured servants and tenant farmers rather than freeholders.

In 1675 a conflict on the Potomac River between Virginia settlers and the small Doeg tribe quickly escalated. It soon included the Susquehannocks and others, as settlers and militiamen struck various groups indiscriminately. Nathaniel Bacon, a recent arrival from England, was particularly aggressive in attacking Native American groups. His acts, in open defiance of Gov. William Berkeley, multiplied the number of the colony's enemies immensely. Eventually, Bacon asserted that all Native Americans were enemies. He also promised freedom and plunder to indentured servants who joined his volunteers. Berkeley declared him a rebel, but Bacon's support was such that the governor had to compromise with him for a time. Eventually, Bacon laid siege to the colonial government itself and burned Jamestown.

Only after the death of its leader was Bacon's Rebellion (1676–1677) suppressed. A new governor executed the rebel leaders, confiscated their lands, and extended the terms of service of indentured servants who had supported them. Class tensions among European settlers were eventually eased, largely at the expense of other groups. This was accomplished by the promise to open more Native American lands to settlement and by the shift in labor policy from white indentured servants to African slaves. The previous militia was replaced with one based on the gentry.

In London, the Lords of Trade had reacted to the rebellion by extending its authority over both the colonial governors and the elected assemblies. For their part, the Iroquois benefited by absorbing the shattered remnants of the Susquehannocks. They also extended their sphere of influence into the Susquehanna and Delaware river valleys.

In New England, prior to the arrival of the Pilgrims at Plymouth, there had already been two failed attempts to establish colonies on the coast of Maine. European seamen, including explorers and those who came temporarily to fish and trade for furs, had also frequented the area. As a grim consequence of those early contacts, an estimated 90 percent of the Native American population had already died from epidemics when the Pilgrims landed. That fact obviously disrupted the lives of the survivors. It also redefined power relationships among them, strengthening inland peoples such as the Narragansetts to the west and the Micmacs to the north, at the expense of coastal groups such as the Wampanoag and the Massachusetts.

At Plymouth, the Pilgrims forged an alliance with Wampanoag chief Massasoit, ostensibly against the Narragansett. Assistance from the Wampanoag allowed the new colony to survive. Aware of fighting in Virginia, the Pilgrims anticipated trouble, but they were not drawn immediately into any major conflict.

By the 1630s the situation had changed. Direct and indirect rivalry among Plymouth, Massachusetts Bay, New Netherland, recent settlers in the Connecticut River Valley, the Narragansett, the Mohegan, and the Pequot over control of the Connecticut River and the wampum trade resulted in the Pequot War (1636–1637).

The Pequot, allied to the Dutch, were nearly destroyed. Those Pequot who survived the war were enslaved by the colonists, absorbed by the Narragansett and Mohegan, or killed by the Mohawk. The new Connecticut Colony—and, temporarily at least, its Mohegan allies —benefited most from the acquisition of Pequot lands. Meanwhile, Massachusetts Bay increasingly overshadowed its smaller neighbor of Plymouth.

For a time, relations with the Native Americans improved. Land pressure was eased somewhat as a number of colonists returned to England to take up arms for the Puritan cause in the English Civil War. Conversions became more common, with "Praying Indians" settling in designated "Praying Towns." With time, however, the peace eroded. The land pressure returned with the restoration of the English monarchy in 1660. And conversion became a source of controversy among the Native Americans. Furthermore, the exhaustion of the New England fur and wampum trade undermined the economic bonds between the settlers and Native Americans. Relations deteriorated more rapidly following the death of Massasoit in 1661.

During 1675–1676, King Philip's War erupted between Plymouth and the Wampanoag. It quickly drew in all the colonies and most of the Native American peoples of southern New England. At the same time, a separate war erupted with the Abenaki in Maine and Bacon's Rebellion raged in the Chesapeake Bay area. In terms of the percentage of population killed on both sides, King Philip's War remains the bloodiest conflict in North American history.

New Netherland and New Sweden

Between the English settlements of the Chesapeake Bay and New England, the Dutch and the Swedes established colonies on the Hudson and Delaware rivers, respectively. Although nominally a Dutch colony, roughly half the settler population of New Netherland consisted of Germans, Huguenots, Englishmen, Brazilian Jews, and African slaves. Unlike most colonies of the time, New Netherland relied on a professional, albeit small, military force for its defense. Eventually, it increasingly supplemented this with militia forces as tensions grew with the Native Americans and New Eng-land. Perhaps most of New Sweden's settlers were Finnish, some were Dutch, and a few were disaffected Puritans from New Haven. New Sweden's early financial backers were Dutch, including disgruntled former officials of New Netherland. Peter (Pierre) Minuit, the German-born Huguenot who established New Amsterdam on Manhattan, was also the founder of New Sweden.

Permanent settlement of New Netherland began in 1624. Its principal port and administrative center, New Amsterdam (today New York City), was founded on Manhattan in 1626. An extensive fur trade was based at Fort Orange (Albany, New York). In 1632 the Dutch established a trading post on the Connecticut River. But in the wake of the Pequot War, New Englanders migrated into that area and settled all around the Dutch outpost. In 1653, during the first Anglo-Dutch War, Captain John Underhill, a privateer who previously had fought the Native Americans of Long Island on behalf of the Dutch, seized the outpost on his own initiative. The Connecticut General

Court sequestered it the following year. This appears to be the only North American action associated with that war.

New Sweden (1638–1655) spread gradually from its initial focal point, Fort Christina (Wilmington, Delaware). The colony traded with the Delaware and the Susquehannock and had relatively few difficulties with the Native American population. However, the colony did not last very long and its population never exceeded a few hundred people. It was also situated on territory previously claimed by the Dutch. In 1651 the Dutch constructed Fort Casimir (New Castle, Delaware), which, had it been adequately maintained and supplied, could have controlled access to the Delaware River. A newly arrived Swedish governor, reversing the largely live-and-let-live attitude that had prevailed, seized Fort Casimir in 1654. In retaliation, in 1655, New Netherland seized the entire Swedish colony. Neither of these military actions met with serious resistance.

Tensions had gradually risen between New Netherland and the Algonquian peoples of the lower Hudson Valley. Among the reasons were the invasion of Native American cornfields by colonial cattle and hogs and the subsequent killing of the livestock by the Native Americans. Director Willem Kieft exacerbated the situation when he determined that the Native American population ought to be paying taxes to the settler government. Matters quickly escalated into Kieft's War (1643-1645). That was followed later by the Peach War (1655), which broke out while Director General Petrus Stuyvesant was subduing New Sweden. That in turn was followed by the Esopus Wars (1658–1660, 1663–1664) farther up the Hudson. The Swedes on the Delaware River, now part of New Netherland, refused to participate in the Esopus Wars, citing their previous policy of non-aggression toward the Native American population. In combination, these wars destroyed Native American power in the lower Hudson River Valley and on Long Island. Yet they also left the Dutch colony exhausted and faction ridden.

After the end of the English Civil War and the restoration of the monarchy in 1660, the English began to wonder why they had tolerated the presence of the Dutch on a territory wedged between their New England and Chesapeake Bay colonies. To make matters worse, Dutch ships based in New Amsterdam regularly violated the English Navigation Acts, which had in fact been enacted with Dutch shipping in mind. In 1664 an English fleet seized New Netherland, which was then divided in two and renamed New York and New Jersey.

This action contributed to the outbreak of the Second Anglo-Dutch War, which the Dutch won. By then, however, Dutch leaders had lost interest in North America and willingly traded their former colony for rights to Suriname, on the South American coast. The Dutch briefly reoccupied New York (1673–1674) during the Third Anglo-Dutch War but yielded it on the conclusion of peace.

Carolina, Pennsylvania, and New York

In 1670, planters from Barbados established the colony of Carolina (in 1712 it divided into North and South). They engaged local groups, such as the Yamasee, in capturing members of other Native American nations to be sold into slavery. Other colonists, includ-

ing the New Englanders, and even some Native Americans, had kept Native American captives as slaves. But the Carolinians appeared particularly aggressive about starting fights for that purpose. To prevent slaves' rescue by their compatriots, the Carolinians sent them to Barbados to be exchanged for African slaves. As the direct agents in this sordid business, the Yamasee absorbed much of the wrath of the other tribes. Tensions arose between Carolina and a succession of Native Americans, precipitating the Westo War (1680–1683), the Tuscarora War (1711–1713), and, finally, the Yamasee War (1715–1717, between the colony and its erstwhile ally). Carolina's proprietors failed to support the colony adequately, especially during the Yamasee War. This neglect resulted in the overthrow of the proprietary government and Carolina's gradual transition to a royal colony.

The Quaker founders of Pennsylvania (established in 1682 and incorporating present-day Delaware with its Swedish and Dutch settlements) took a very different approach. As a matter of faith, Quakers refused to make any personal contribution to military endeavors. Indeed, Pennsylvania was the only colony to proclaim pacifism as a fundamental policy from its inception. This policy attracted a number of other pacifist settlers—including members of such German religious sects as the Mennonites, Amish, Brethren (Dunkers), Schwenkfelders, and Moravians. Because of the colony's "open door" immigration policy, however, nonpacifist settlers eventually outnumbered the pacifists. These included many Scots-Irish who settled in particularly vulnerable locations on the frontier.

Pennsylvania's situation created unique dilemmas for its Quaker-dominated establishment. The government was confronted by the reality of wars, the demands of the imperial government and the other colonies for contributions to collective defenses, the demands of nonpacifist frontier settlers, and the responsibility of providing for the safety and welfare of a mixed population. Thus, as early as 1689, with the onset of King William's War, the government permitted nonpacifists to organize their own defenses if they wished, although they were not to expect any encouragement or assistance from the authorities. After the death of founder William Penn in 1718, Pennsylvania politicians became more open to the need to consider compromises. However, pacifist voters remained steadfast, and a strong pacifist strain endured in the legislature.

The colony was successful for many years at maintaining peace with the Native American population. It was largely free of Indian wars until 1755. In part the Pennsylvanians were aided by the fact that others had largely subdued the Native American population in the Delaware and Susquehanna valleys in earlier conflicts. In addition, at least some Native Americans respected the pacifist tradition, restraining from killing known Quakers when war did break out, even if they found them a bit odd.

New York also occupied an unusual position. The English, who had seized New Netherland in 1664, inherited one kind of relationship with the vanquished natives of the Hudson Valley. Yet they inherited a very different relationship with the Iroquois Confederation, which stretched from the Mohawk River Valley to Lake Erie.

The Iroquois largely controlled the non-French fur trade of the upper Great Lakes and willingly brought their wares to trade at Albany.

In addition to their role in the fur trade, the Iroquois occupied a strategic position between New York and New France. They were situated geographically in order to intercept east-west traffic through the Mohawk River Valley and on the Great Lakes, as well as north-south traffic through the Lake Champlain Valley. They also nurtured a longstanding enmity toward the French and their Native American allies. The Mohawk Iroquois had intervened at key points in ways that supported the English during the Pequot War and King Philip's War. These facts bolstered the Iroquois' usefulness to New York. The basis for mutually advantageous relations was further reinforced by the relatively slow population growth of New York and by the continued economic importance of the fur trade.

In the 1680s, New York forged a military alliance with the Iroquois Confederation and certain groups subordinated to them, including the Mahican, the Delaware, and the Shawnee. This came to be known as the Covenant Chain. In the view of New York's governor, although not necessarily in the view of the Native Americans, this treaty made the Iroquois and their tributary tribes subjects of the English crown. It also allegedly made their territories part of New York.

The Intercolonial Wars

The few North American clashes associated with the Anglo-Dutch wars gave evidence that the colonies were becoming significant enough to attract the attention of Europe's war makers. After 1689, North America's connection to European wars would become more automatic.

By 1676 the major Native American groups of New England, the Hudson River Valley, and the Chesapeake Bay had been largely pacified, marginalized, or pushed into exile in remote regions. They ceased to operate as significant military or political forces. The physical and monetary costs of the wars also had reduced the political autonomy of the English colonies. The fact that the colonies were being drawn into European wars, however, soon increased the importance of larger Native American tribes and confederations situated on the frontiers between the colonies. This was particularly true during that intermediate period when each colony's enemies appeared strong enough to pose a threat and yet no colony felt itself strong enough to rely on its own resources for defense. These Native American nations, in turn, learned to play French, English, and Spanish colonies against one another, albeit for a limited time.

By the late 17th century, France, under King Louis XIV, was the most powerful country in Europe. Its power and aggressiveness, however, alienated a growing number of European heads of state. While France benefited economically from its colonies, it was much less dependent on overseas colonies than either Spain or the Netherlands had been.

Although North American colonies were increasingly drawn into the wars of Europe, they would have little impact on the outcomes of these conflicts. From the European perspective, fighting

in North America was intended less to seize strategic advantage than to seize easily acquired assets that could later be traded at the bargaining table. The governments of the mother countries merely sent instructions that the colonies of the rival empire were to be attacked. However, in the early wars, material assistance, even when promised, rarely arrived. Attention was devoted to North America primarily at the beginning of wars, when offensives were unexpected and assets could be most easily seized, and toward the end, when maneuvering for bargaining advantage was most acute.

The four wars between the English and French colonies in North America might better be described as two long wars, each interrupted by a brief interregnum. The first included King William's War (1689–1697) and Queen Anne's War (1702–1713). Then came an extended period that can be viewed as the colonial "Cold War." The second period of open conflict included the Anglo-Spanish War (1739–1744), King George's War (1744–1748), and the French and Indian War (1754–1763). Within this overall sequence, however, the French and Indian War must be distinguished. It was different from the rest in its sources and far more consequential in its scale, in the level of direct European military involvement, and in its impact.

King William's War

In 1685, King Charles II died and was succeeded by his Catholic brother, the duke of York, now known as King James II. James proved an arbitrary and capricious ruler. In the Old World, he closed down Parliament. In the New, he determined that the northern colonies had to be brought to heel. He revoked charters, closed assemblies, and merged the colonies into the Dominion of New England. Governor General Edmund Andros ruled with a hand-picked council from Boston; a lieutenant governor was stationed in New York. Andros deposed and replaced officials at will, imposed new taxes, and vigorously enforced the Navigation Acts in ways that induced a contraction of the economy.

In 1688 Protestant politicians in England launched the Glorious Revolution against James and invited William of Orange to lead it. William, a Protestant and the stadholder (leader) of the Dutch republic, which had been England's rival, was the grandson of Charles II, the husband of James's Protestant daughter Mary, and the leader of a multinational coalition against the Catholic king Louis XIV of France. William's "invasion" of England met little resistance, and James fled to France. In 1689 William and Mary became joint sovereigns of England, and England joined a coalition war against France. Thus began the first of the four Anglo-French colonial wars in North America.

The military balance in North America was not easily calculated. Whereas England had only one-fifth the population of France in the late 17th century, English settlers in North America outnumbered French settlers by more than 12 to 1. On the other hand, the English were divided into multiple colonies and failed to find a formula for effective collaboration.

More unified politically, the French colonists were disproportionately adult males, were more likely to have had military experience,

and made effective use of their Native American allies as force multipliers. Most French raiding parties were really composite French– Native American units.

In 1689, the English colonists were not only divided into separate political entities but also engulfed in the Glorious Revolution. That had spurred the collapse of the Dominion of New England and the arrest of Andros. In Maryland, Protestant planters overthrew the Catholic-dominated colonial regime. In neighboring Virginia, the royal governor was absent and the governor's council simply switched sides, declaring for William and Mary. In New York, Jacob Leisler, a German-born Calvinist merchant, deposed the lieutenant governor and assumed the office himself, invoking the names of William and Mary. Leisler, however, proved a divisive and ineffective leader. In the end, he was hanged for treason when he hesitated to give up his office to the actual representatives of the sovereigns in 1691.

In general, William was not interested in revolutionizing England or the colonies. Instead, he sought compromise solutions that would allow him to get on with the war with France. In the colonies, that included the return of elected assemblies, albeit controlled by small groups of intermarried elite families, with control over finances. Another concession that soon followed was the termination of the Royal African Company's monopoly on the slave trade. This opened the flow of enslaved African laborers for the plantations of North America. In return, the king expected greater cooperation in military operations and the expenditures they required.

New England troops, who were already at war with the Abenaki on the northern frontier, promptly abandoned their posts after the collapse of the dominion. Still, the colonies of New England and New York, situated adjacent to New France, bore the brunt of the fighting in King William's War. More distant colonies such as Virginia sat on the sidelines.

Realizing that they were vastly outnumbered, the French relied as well on the "skulking way of war," which put a premium on hit-and-run raids against vulnerable targets. Three such raids in early 1690 marked the operational beginning of King William's War, a war that set many patterns for those that followed. Destroyed were Schenectady, New York; Salmon Falls, New Hampshire; and Falmouth, Maine. Buildings were burned, livestock slaughtered, and inhabitants killed or taken as captives. Isolated communities throughout the frontier came to see themselves as potential targets, and many residents fled the frontier regions. But whereas an all-out attack on Albany might have done serious damage to both New York and the Iroquois, these smaller and brutal attacks served to strengthen the resolve of the northern English colonies.

The amateur military leaders of New York and New England gathered in Albany and devised a counterstrategy that would remain the basic model for decades to come. They imagined a coordinated, two-pronged attack against the great strongholds of Canada. The first would be an overland march through the Hudson River, Lake George, and Lake Champlain valleys toward Montreal. The other would be an assault by sea and the St. Lawrence River to

Quebec. A Massachusetts force, led by Sir William Phips, had already raided the fort at Port Royal, which had been singled out by the New Englanders for its role in supporting French privateers. Although Phips did not attempt to occupy the Acadia colony, the way to the St. Lawrence River was now open.

As it turned out, the two-pronged operation was a disaster. The Montreal advance ended with a raid on the settlement of La Prairie, across the river from Montreal, instead of the stronghold itself. The fleet attacking Quebec arrived weeks behind schedule only to discover that it lacked sufficient food and ammunition for a siege. Disillusioned, the English colonies attempted no further large-scale operations for the remainder of the eight-year war. Most of the remaining combat consisted of inconclusive, small-scale raids against the other side's outlying villages or Native American allies.

On the Maine frontier, King William's War merged with an ongoing conflict between Massachusetts and the Abenaki. The Abenaki had receded into northern Maine, Canada, and Acadia after King Philip's War. Frontier disputes and skirmishes followed, which escalated into full-scale war in 1688. When King William's War began, the French offered aid to the Abenaki.

Farther to the west, the Iroquois were once more at war with the French, triggered this time by a dispute over control of the fur trade along the Illinois River. This conflict also merged quickly with the new European war. The Iroquois sided with New York. It was with New York's encouragement that the Iroquois destroyed the village of Lachine on the St. Lawrence River in 1689. No doubt, the memory of the Lachine massacre played a role in the French decision to attack Schenectady in 1690.

The Iroquois, however, soon came to the conclusion that they, not New York, were absorbing the worst of the French attacks, including major assaults on Mohawk villages in 1693 and Onondaga and Oneida villages in 1696. They also suffered relentless attacks by the Ojibwa and other western nations, who drove them out of the former Huron territory. By the end of the 1690s, war, war-related diseases, and defections had cost the Iroquois half, possibly two-thirds, of their warriors.

The Iroquois were then isolated, and incensed, when the Treaty of Ryswick ended the war in Europe and the war between New France and New York in 1697. New York terminated what support it had been offering the Iroquois but encouraged them to fight on. This, and the damage suffered in many decades of warfare, contributed to a shift in the relative influence of Iroquois factions. It also resulted in a fundamental reevaluation of Iroquois relations with the European colonies. A series of meetings held separately with New York, on the one hand, and with New France and the Great Lakes nations, on the other, produced the 1701 Great Peace of Montreal. The Iroquois Confederation thereby declared its neutrality in future intercolonial wars. Although they nominally renewed the Covenant Chain, the Iroquois remained on the sidelines of intercolonial strife. While at peace with New York, New France, and the Great Lakes nations, the Iroquois nonetheless launched numerous raids against the distant Catawba and Cherokee, who were allies of the English colonies of Carolina and Virginia—much to the delight of the French.

During the brief peace between the wars of King William and Queen Anne, the French sought to assure control of the Mississippi River by establishing a colony on the Gulf of Mexico, at or near the river's mouth. New France, henceforth, would consist of two great provinces, Canada and Louisiana. Settlements were founded on Biloxi Bay (1699), Mobile Bay (1702, relocated in 1711), and on the Mississippi itself at New Orleans (1718). Anticipating the French move, the Spanish established a fort at Pensacola Bay (1698) to strengthen their claims to the Gulf Coast. The English colonists viewed Louisiana as well as the new French outpost at Detroit (1701) with suspicion.

Queen Anne's War

Peace in Europe lasted a mere five years. Carlos (Charles) II, the last Habsburg king of Spain and French king Louis XIV's brother-in-law, died childless in 1700. Pressed by Louis XIV, before his death Charles had willed his entire inheritance to Louis's grandson, Philippe of Anjou. Louis knew this must mean war, but Philippe duly succeeded his great uncle as King Philip V. The other major European powers were unwilling to countenance the prospect of Louis XIV's France dominating Spain and perhaps one day becoming a single, vast worldwide Bourbon kingdom, and they went to war against France and Spain in 1702. The alliance again included England, now led by Queen Anne, daughter of James II and sister of Mary. Once again the French and English colonies were informed that they were at war with one another, but now Spanish Florida was allied with New France.

This time there were no ongoing Native American wars on the northern frontier. Indeed, because of Iroquois neutrality, New York managed to stay out of the war entirely. Canada allowed this for fear of upsetting the Iroquois and driving them back to war. New York, which had tried to prevent Iroquois neutrality, was now content to take advantage of that situation as long as England remained unwilling to invest serious military resources in a North American campaign. Thus, while war raged in New England, New York continued the fur trade with the Iroquois and even, indirectly, with Canada. Understandably, this produced some bad blood among the northern colonies. No doubt the continued role of Dutch traders in New York's relations with the Iroquois added fuel to New England's suspicions.

Fighting on the North American mainland began when the Abenaki, with the encouragement of Gov. Pierre de Rigaud de Vaudreuil of New France, attacked outlying settlements in Maine in 1703. In February 1704, a party of Canadians, Abenaki, and Catholic Iroquois attacked Deerfield, Massachusetts. The community had survived attacks in King Philip's War and King William's War, and its destruction in this war became a rallying cry for the New England settlers.

These French-sponsored raids were intended to disrupt New England and forestall a major offensive against Canada. The forces

of Massachusetts responded with raids against the Abenaki in Maine and Acadia. But they stopped short of attacking any significant French fortifications. Lacking any direct issues between each other, New France and Massachusetts quietly considered a separate peace in 1705–1706, but negotiations failed. Coastal interests in Massachusetts continued to focus on Port Royal, Acadia, as a haven for French privateers and a perceived recruiting station for hostile Native Americans. Giving up hope of help from England, the New Englanders made two halfhearted and unsuccessful attempts to take the fortress in 1704 and in 1707.

Another two-pronged attack on Canada, with promised support from England, was planned for 1709. But it failed to materialize when the English forces were sent to Portugal instead. In 1710, supported by English warships and marines, the New Englanders seized Port Royal and held it until the end of the war. The two-pronged assault was resurrected once again in 1711, with the plan of taking Quebec and Montreal, this time with the support of a much larger English force, but it failed in the face of fog and high winds.

The seizure of Acadia had nonetheless changed the situation on the ground. Unlike King William's War, Queen Anne's War changed borders, although the overall outcome was mixed. In the general settlement known as the Treaty of Utrecht (1713), Canada and Louisiana remained French. Nevertheless, France recognized Britain's claim to Hudson's Bay and ceded both Newfoundland and Acadia. Acadia was renamed Nova Scotia and became a new British colony. People in Massachusetts, who had made numerous expensive but unsuccessful efforts to seize the place, believed that they were now being excluded from the spoils of victory.

Massachusetts should have benefited from the closure of the French privateering base at Port Royal. The ultimate outcome, however, was not so straightforward. France retained Cape Breton Island (Île Royale) immediately to the east and there constructed a new military and naval base known as Louisbourg. Moreover, a diplomatic dispute soon arose over the borders of Acadia. Whereas Acadia previously had been understood to include the present-day Canadian provinces of Nova Scotia (including Cape Breton Island), New Brunswick, and Prince Edward Island, as well as parts of Maine, the French now maintained that in ceding Acadia they had given away no more than the Nova Scotia peninsula.

Spain was an integral part of Queen Anne's War. In North America, that meant fighting in the south, where Spain held Florida. Because the colony of Georgia did not yet exist, Carolina stood on the frontier. In a 1670 treaty, Spain had recognized England's possession of lands north of St. Helena Sound (South Carolina) in return for English recognition of Spain's claims to the south. Regardless, slaving expeditions by Carolina and its Yamasee and Creek allies had driven the Spanish mission villages out of present-day Georgia by 1686.

In 1702 the Creek were at war with the Spanish and their Apalachee allies in the Florida panhandle. They were also at war with the French-backed Choctaw to the west. In need of support, the Creek turned to Carolina, and thus Carolina was already supplying them with arms when news arrived of the outbreak of Oueen Anne's War.

Carolina governor James Moore led an expedition against the Spanish stronghold of St. Augustine in 1702, but he failed to capture the fort there despite a four-month siege. In 1703–1704, Moore, now no longer governor, led a Carolina-Creek expedition through the Apalachee mission province of northwest Florida, where the fighting climaxed at Ayubale. Whole villages were destroyed, and the captives were sold into slavery. Later, the Creek and Chickasaw made further raids against Spanish Pensacola, the Choctaw, and French Mobile. Neither the Spanish nor the French were able to mount a meaningful counterattack. Having secured their position, the Creek made peace with the French in 1712 and sought to maintain neutrality, much as the Iroquois were doing in the north.

The Peace of Utrecht: A Colonial Cold War

The Dutch had brought England into the wars with France back in 1689. Ironically, although the military outcome of the wars had been ambivalent, England emerged from these wars as a major imperial, military, commercial, and financial power while the Netherlands went into decline. The Utrecht treaty brought peace to Europe for most of the next 25 years, but there were exceptions. Under the treaty, Louis XIV's grandson, Philip V, continued as king of Spain, but the two thrones and the two countries were to remain separate. Nevertheless, when Louis died, Philip claimed the throne of France. Thus began the War of the Quadruple Alliance (1718-1721), which uncharacteristically brought Britain and France together against Spain. The principal repercussion of this war in North America was a contest between French and Spanish forces over control of Pensacola, which changed hands three times in 1719. Spain did plan a campaign against Charles Town (today Charleston, South Carolina) and assembled an armada in Havana to that end. Nevertheless, the fleet had to be diverted to Pensacola and the campaign never occurred. Pensacola was restored to Spain by treaty at the end of the war. A brief war between Britain and Spain (1727-1728) provided South Carolina with another opportunity to besiege St. Augustine, but this too failed.

Taking advantage of the relative calm after Utrecht, English and French colonists resettled the exposed frontier areas and gradually extended the frontier into new areas. New York established a trading post and then a fort at Oswego, on Lake Ontario, in the 1720s. This was the first British outpost on the Great Lakes, permitted by the Iroquois to balance the French post at Niagara. The French immediately viewed it as a potential threat to their control of this vital inland waterway and to the fur trade it carried.

In 1733, settlement began in the new colony of Georgia, which was to serve both as a philanthropic project for the rehabilitation of debtors and as a military buffer between South Carolina and the Spanish and French outposts of the Florida peninsula and the Gulf Coast. Uncharacteristically, the British army stationed a regiment of Scottish Highlanders in Georgia after 1738. Normally, the only

regular British troops in the colonies were the four independent companies in still heavily Dutch New York.

While tensions simmered among the colonies, open warfare occasionally erupted between them and Native Americans. In Carolina, the Tuscarora, seeing themselves as hemmed in by North Carolina land developers and South Carolina slavers, attacked the surveyors planning a new Swiss settlement. In the resulting Tuscarora War (1711–1713), the Carolinians reapplied tactics they had used in Queen Anne's War. They led raiding parties composed mostly of friendly Indians, often failing to distinguish between hostile and neutral villages as targets of attack. In the aftermath, the surviving Tuscarora, a Southern Iroquoian people, relocated to live with their northern brethren in the Iroquois Confederation. Henceforth, the Five Nations of the Iroquois would be known as the Six Nations.

Trouble soon spread to Yamasee country. The Yamasee had long been allies of Carolina in the slave trade and in wars against other Native Americans and against Spanish Florida. Coastal planters viewed the Yamasee territory along the Savannah River as their defensive buffer. Now, however, the Yamasee warriors saw themselves subject to similar depredations, with traders seizing their wives and children in payment for debts. The result was the Yamasee War (1715–1717), in which the Yamasee were joined by the Creek and the Catawba. Running low on Indian allies, Carolina made the unusual move of arming and mobilizing 500 African slaves as part of the army of retribution. In 1716, first the Catawba and then the Creek dropped out of the war, and Carolina succeeded in bringing the wavering Cherokee into the war on its side. Ultimately, the Carolinians drove the Yamasee out of their territory.

The failure of Carolina proprietors to support the colony during the expensive and bloody war generated popular resentment. With that failure in mind, the colonists deposed the proprietors' governor in 1719, when they heard rumors that a Spanish fleet was coming to attack, and demanded a royal governor. The Native American slave trade, already in decline, largely faded out after the Yamasee War. Because the Carolinians had driven out the Yamasee, they eventually sought to reestablish their buffer zone by canvassing the European continent for poor Protestants to resettle the Yamasee territory.

On the Maine frontier, the Abenaki were of two minds about whether to allow the further expansion of New England settlers and whether to continue the fight or to seek some sort of accommodation. Arguing against accommodation was Sébastien Râle, an influential French Jesuit who had resided in the Abenaki settlement of Norridgewock, on the Kennebec River, for three decades. Skirmishes broke out, and in 1722 New Englanders burned Norridgewock, including Râle's mission. When the Abenaki retaliated, Massachusetts declared them in rebellion. Dummer's War (1722–1727), named for the acting governor of Massachusetts, put an end to Abenaki resistance for two decades. Râle himself was killed in a raid in 1724, a turning point in the conflict.

The early interest of Carolina traders in exploring and raiding the lands to their south and west had prompted the French to estab-

lish Louisiana to assure their control of the Mississippi. There they established Native American policies modeled on those in Canada, such as learning the languages, building outposts in the villages, and holding annual gift-giving conferences. Yet their success in winning allies was less complete than it had been in Canada.

Once they were planted on the Gulf Coast, the French began to extend their widely spaced system of trading posts, forts, and provisioning stations to form a chain from Canada to Louisiana. Indeed, as the resources available for France's colonies became scarcer, French ambitions appeared to become more grandiose. They built Fort Pontchartrain (Detroit, 1701) on the Detroit River, Fort Michilimackinac (1715) on the strait between lakes Huron and Michigan, Fort Rosalie (1716) among the Natchez on the Mississippi River, Fort Toulouse (1717) on the Coosa River, Fort Ouiatenon (1718) and Fort Vincennes (1729) on the Wabash River, Fort Chartres (1720) on the Kaskaskia River, Arkansas Post (1721) on the Arkansas River, Fort Niagara (1726) on the Niagara River at Lake Ontario, and Fort Beauharnois (1727) on the Mississippi in Minnesota.

The French had neglected their alliances with the peoples of the upper Great Lakes during Queen Anne's War. They had also ignored pleas for mediation as disputes began to flare among their allies. The Fox nation, whom the French had relocated from Wisconsin to Detroit, formed a fur-trading pact with the Iroquois. This was unusual if not unprecedented for Algonquians of the upper Great Lakes. In this and other ways they managed to alienate most of their neighbors, Native American and French alike.

In 1712, before Queen Anne's War was officially concluded, the Fox Wars began at Detroit. They continued off and on for two decades, culminating in 1730 when the Fox attempted to escape to Iroquois Country only to be stopped on the Illinois prairie by a vast coalition of Native Americans and French. The outbreak of the Fox Wars prompted the French to revitalize their alliances with the Great Lakes peoples and redouble their effort at building forts.

Farther to the south, Louisiana formed an alliance with the Choctaw of present-day Louisiana and Mississippi against the English-backed Chickasaw. Louisianans sought to compete with Carolina for the friendship of the Creek and the Natchez, and both groups invited the French to build forts in the aftermath of the Yamasee War. But irritations soon arose. The Creek, like the Iroquois to the north, sought to restore the position of neutrality between English and French first established at the end of Queen Anne's War. They managed to do so, with occasional lapses, but they became involved in a prolonged war with the Cherokee, erstwhile adversaries in the Yamasee War. The French took advantage of the turmoil to entice the usually pro-English Cherokee closer to themselves. Meanwhile, both the Creek and the Cherokee became increasingly divided and factious in the course of the war.

The Native Americans in and around Louisiana, as in many other places, were divided between the attraction of European trade goods and resentment over both the dependence created by them and the land hunger and frequent chicanery of Europeans. In 1729, the Natchez destroyed Fort Rosalie and massacred 300 people

there. But without access to rival European suppliers of arms and ammunition, they were quickly subdued. When the Chickasaw gave refuge to Natchez survivors, the French turned on them. They encouraged the Choctaw to attack the Chickasaw as well. Supplied by Carolina, the Chickasaw fared much better than the Natchez. In 1736 the Chickasaw defeated a combined attacking force of 400 from Canada (French, Illinois, and Wyandot) and 1,300 from Louisiana (French, Choctaw, and a company of 140 African slaves with black officers). Later, larger forces also failed to subdue them. Meanwhile, cross-pressures on the Choctaw contributed to a civil war within that nation.

The Renewal of the European Wars

In 1739 Britain and Spain entered into the Anglo-Spanish War (War of Jenkins' Ear, 1739-1744), purportedly caused by the loss of an English sea captain's ear to Spaniards who had caught him smuggling. By 1739, however, British leaders were looking for an excuse to demand that Spain amend the strict trade regulations that British and colonial seamen were already violating with great regularity. In particular, the British were hoping to strengthen their position visà-vis the French by expanding their hold in the Caribbean at the expense of a supposedly easy target—the decaying Spanish empire. A relatively minor war, the Anglo-Spanish War was the first colonial conflict to begin because of a colonial issue. It was also the first to be fought primarily in the New World, without a significant European component, and the first in which the British armed forces recruited sizable numbers of colonials into their ranks.

The first incident in North America that might reasonably be connected to the War of Jenkins' Ear was the Stono Rebellion, which actually occurred in the weeks building up to the declaration of war. Florida, sparsely populated and poorly policed, had been a refuge for fugitive slaves who were able to make their way there. Now, the Spanish governor promised as a matter of policy the emancipation of any British slave who arrived on Florida's territory. He did this not because Spain was opposed to slavery but because it appeared to be an effective way to undermine the economies of South Carolina and the new colony of Georgia.

On September 9, 1739, near South Carolina's Stono River, a band of African slaves broke into a store of arms and headed southward, killing some 25 whites along the way. They had covered about 10 miles before being overtaken by a hastily assembled militia. Thirty of the rebels died in the clash; others scattered. The colonial authorities recruited Chickasaw and Creek scouts to hunt them down, and all but 1 were captured over the course of the next six months.

One consequence of the Stono Rebellion was a heightened alert throughout the colonies for slave revolts fueled by "papist conspiracies." In 1741, after several fires in New York City were attributed to arson, a series of quick trials resulted in the execution there of 31 African slaves. Perhaps 70 suspect Africans were transferred to the West Indies and other Atlantic islands, where a slave's life was brutal and short. Also hanged were 4 whites, including 1 who was accused of being a Catholic priest in disguise and thus presumed to be in league with the Spanish. Laws regarding the treatment of slaves were tightened once again. Historians continue to debate whether the so-called Negro Conspiracy of 1741 really existed.

An assault on St. Augustine in 1740 constituted the only significant British land offensive of the Anglo-Spanish War. James Oglethorpe, founder and governor of Georgia, was given nominal command of Georgia and South Carolina forces. Still shocked by Stono, South Carolina sent him far fewer troops than requested and put a strict time limit on their deployment. Oglethorpe's force of Georgian and Carolinian militias, Highlanders, and Cherokee and Creek warriors, supported by a few Royal Navy vessels, thus had insufficient time to conduct a proper siege. One successful Spanish resupply operation condemned the entire operation to failure.

The other notable episode of the war was a large British operation intended to seize Cartagena, Colombia, in 1741. Vice Admiral Edward Vernon, who had already conducted a successful raid against the treasure fleet port of Portobello, Panama, had charge of the naval forces. The mission failed due to the hesitance of the army commander, Major General Thomas Wentworth, and an outbreak of yellow fever that claimed a large percentage of the force. Later efforts against Santiago and Panama also failed, again primarily because of Wentworth's reluctance. Minor raids and privateering operations constituted the remainder of the war.

King George's War

The War of Jenkins' Ear never really ended. Rather, it merged into another, larger European conflict, known in Europe as the War of the Austrian Succession (1740–1748) and in North America as King George's War (1744–1748). As with Queen Anne's War, this also began with the death of a Habsburg. Karl VI of Austria did not die childless, but he did die without a son, leaving the throne to his daughter Maria Theresa. Prussia invaded Austrian territory almost immediately in a blatant bid to seize Silesia, and France soon entered the war on the side of Prussia. Spain laid claim to fragments of Austrian territory, and France began lending support to Spain as early as 1740, although Britain formally entered the war against France and Prussia only in 1744. With the official declaration of war, the focus of British eyes shifted from Spain to their more powerful rival, France.

The North American colonies were again to go to war with limited expectations of support from Europe, although European fleets would play a larger role this time. The fighting began when French forces from Louisbourg seized the fishing station of Canso, Nova Scotia, in May 1744. Fortunately for the British, prisoners taken to Louisbourg and later exchanged provided Gov. William Shirley of Massachusetts with important intelligence about the condition of the fort. In 1745 Shirley mobilized 4,000 New Englanders. Under the command of William Pepperell, president of the Massachusetts Council, and with the significant help of a dozen Royal Navy menof-war, they succeeded in capturing the French stronghold.

The following year, the British ordered the other colonies to provide troops, which Britain would pay and equip, and promised to

send a fleet and eight battalions of British regulars to help seize Quebec. Massachusetts, New Hampshire, Rhode Island, Connecticut, New York, New Jersey, and even Maryland and Virginia mobilized troops. As in 1709, however, the British forces failed to appear, having been diverted to an unsuccessful action against the coast of France. The combined colonial forces were eventually dismissed.

A New England and New York force, which had been assembled to attack Fort St. Frédéric (Crown Point) on Lake Champlain and possibly Montreal, was also recalled when word came of the approach of a French fleet. These troops too were dismissed. The Mohawk Iroquois, who had been convinced to undertake raids along Lake Champlain and the St. Lawrence River, returned to their neutral stance. As it turned out, New York once again missed most of the war.

The French did in fact send a fleet, some 76 ships transporting 3,000 troops, to retake Louisbourg and Acadia. This force, however, was devastated en route by hurricanes, calms, drought, and small-pox. It arrived in North America in a terrible state, and its men then inadvertently spread the epidemic to France's Indian allies. The survivors quietly returned to France. Although it never engaged in combat, this unfortunate fleet accounted for the majority of all the deaths suffered in the North American portion of King George's War.

There were no more major campaigns in King George's War. Although New Englanders had always blamed Port Royal and Louisbourg for inciting Native American raids against their frontiers, after the fall of Louisbourg, Abenaki and Micmac attacks in Maine, New Hampshire, and Massachusetts actually became more frequent. The Native Americans even pressed the occupied Acadians into resistance, perhaps worried about the long-term consequences to themselves of losing their allies. Canadian and Native American raids seized Fort Massachusetts; Saratoga, New York; and the garrison at Grand Pré, Nova Scotia.

The loss of Louisbourg and the successful British blockade of French ports, however, cut off the flow of supplies to New France. The sudden scarcity of trade goods had significant repercussions for French relations with their Native American allies. It contributed to a revolt by the Miami in the Ohio Country in 1747, strengthened the pro-British faction in the Choctaw Civil War, and generally increased Native Americans' interest in trade with the British.

Some in London were not pleased, however, with New England's success at Louisbourg. The loss had angered the French government and thus complicated the task of negotiating a mutually acceptable conclusion to the war. In 1748 a treaty was signed on the basis of European issues, not those of North America, and the war ended. As part of the settlement, a commission was formed to establish the borders of Nova Scotia, and an order went out to return Louisbourg to the French. New Englanders were incensed but could do nothing about it.

The French and Indian War

The next war actually began first in the colonies. The French and Indian War (1754–1763) was known in Europe as the Seven Years'

War (1756–1763). It broke with many of the precedents and patterns of the previous colonial wars. The conflict drew in the usual set of European powers, although in an unusual alliance pattern. This war pitted Britain and Prussia against Austria, most of the other German states, France, Russia, and Sweden. The war also spread beyond Europe and North America to places as distant as India and the Philippines.

American issues played a larger role in the course and the outcome of this war than in the earlier conflicts. This time successes in the field would not be negotiated away in diplomatic conferences in Europe. Rather than relying entirely on amateur militias and colonial troops, each side transported sizable professional armies across the ocean to meet in decisive engagements. Backed by such regular troops, New France would be far more aggressive than in the past. Early in the war, the French established new forward positions that were intended to block potential invasion routes and to keep the war closer to British population centers and farther away from their own. French commanders would rely far less on Indian forces.

The clash began in the peripheral areas of the colonial empires, where years of neglect had allowed many colonial claims to overlap, yet where each side appeared to consider its own stance so obviously legitimate that it was sure the other would back down when confronted with a moderate commitment of force. Specifically, it started along the headwaters of the Ohio River, a region claimed simultaneously by Pennsylvania, Virginia, New France, the Iroquois Confederation, and the Cherokee, as well as by the Delaware, Shawnee, and Mingo tribes who actually lived there.

By the 1740s Pennsylvania traders were moving across the Appalachians into the valleys of the Allegheny, Monongahela, and Ohio. They were simply following the gradual westward migration of Native Americans who had been pushed away from the East Coast by the Europeans and by the Iroquois. These ethnically mixed Indian refugee populations established villages in the Ohio Country and continued to be nominally linked to the Covenant Chain and thus theoretically subordinate to the Iroquois Confederation. They acted with increasing independence, however, negotiating with outsiders on their own behalf rather than through the Iroquois councils at Onondaga (Syracuse) in New York.

The French termed these settlements "Indian republics," using a word to which they attached a very negative connotation at that time. The French considered the Ohio fur trade marginal and had long neglected the Ohio Country. Nevertheless, they now viewed these incursions by British traders as potential threats to their control of a vital inland waterway, their ties to Native Americans in the nearby Illinois Country, and their lines of communication. French interest in the area derived less from its inherent economic value than from its strategic and political value. This was made more urgent only because the British were now there.

Pennsylvania claimed the headwaters of the Ohio River. As was customarily the case, however, it refused to take action to defend the region despite the demands of the frontier settlers. By the 1740s the Quaker-dominated Pennsylvania Assembly was more willing to

make compromises regarding some defense-related expenditures, but the issue remained controversial, touching off riots in Philadelphia during the elections of 1742. During King George's War, after a French privateer bombarded New Castle with impunity for nearly a week, the colony established its first-ever militia (known as the Association) in 1747. A strictly voluntary organization, it was abolished a year later when the war ended. Thus there was no militia when the Ohio Country heated up.

About 1748, a faction of the Miami that had rebelled against the French during King George's War established the village of Pickawillany on the Miami River. They invited Pennsylvania traders there, some 250 miles west of the Appalachian Mountains. In 1749 King George II granted the area to the Ohio Company of Virginia. A relatively minor dispute thus appeared to be developing between Pennsylvania and Virginia, but French authorities saw little reason to distinguish between these two. Indeed, they may have seen these "British" actions as more coordinated and more strategically motivated than was the case.

In the meantime, similar steps were being taken in Nova Scotia, where the old boundaries of Acadia were still under dispute. In 1749, to cement their hold on Nova Scotia, the British ordered the construction of Halifax. The French saw this step as a threat to Louisbourg and its supply lines, and they responded in 1750 with the establishment of Fort Beauséjour at Chignecto Bay, on the northern rim of the peninsula. On their part, the English viewed this as a forward base for the supply and incitement of hostile Acadians and Native Americans.

In 1749 New France authorities sent a tentative expedition under Céloron de Blainville to reassert its claim to the Ohio Country. In 1752 Pickawillany was destroyed by a party of 180 Ojibwa, 30 Ottawa, and 30 Canadians led by Charles Langlade, a métis (in this case, the son of a French father and an Ottawa mother) serving as an officer in the troupes de la marine. In response, Pennsylvania traders withdrew from the Ohio Country, abandoning their former customers. The security guarantees of the Covenant Chain also came to naught, and the "Indian republics" sought accommodation with the French.

In 1753 the French began building a series of forts to control access from the Great Lakes to the Ohio Country at Sandusky Bay, Presque Isle, and along the route from Presque Isle to the Allegheny River. Given the lack of action by Pennsylvania, Virginia, in its first real dispute with New France, sent a letter of protest, carried by young Major George Washington, which the French rejected.

In 1754 Virginia began building a fort at the Forks of the Ohio (today Pittsburgh). Some 500 French troops seized the uncompleted structure and then built their own larger redoubt, which they named Fort Duquesne. Washington attempted to take back the site but was defeated at a makeshift fortification that he dubbed Fort Necessity. The French and Indian War had begun. Yet Pennsylvania had no militia, and that of Virginia had become almost a social club.

As this was occurring on the western frontier, in June–July 1754, a congress met in Albany, bringing together representatives of the

Iroquois Confederation and those of seven colonies: Connecticut, Maryland, Massachusetts, New Hampshire, New York, Pennsylvania, and Rhode Island. Meeting against the backdrop of spiraling Anglo-French tensions, the meeting had actually been spurred by Mohawk chief Hendrick (Theyanoguin). One year earlier, he had renounced the Covenant Chain because New York was not fulfilling its obligations. At the congress, the colonists sought to win the Iroquois back to their camp and, at the instigation of Benjamin Franklin, devised the outline for an intercolonial confederation.

The envisioned body would feature a "general government" capable of declaring war, raising armies, levying taxes, regulating trade, and negotiating with Native Americans. Although both projects would have greatly helped the war effort, neither enjoyed much success. The Mohawk were receptive to the idea of a pact against the French, but other Iroquois were far more reluctant, noting the failure of the British colonies to take significant action in the Ohio Country.

The outcome of the Albany Congress was a nominal renewal of the Covenant Chain, supported by donations to the Iroquois, but no promise to assist in any war with the French. The proposal for an intercolonial confederation was rejected by both the colonial assemblies and the British Lords of Trade. Within two years, however, the British government did take the power to negotiate with the Native Americans away from the individual colonies and established two royal superintendents of Indian Affairs. One was based in the Mohawk River Valley of New York and the other in Charles Town, South Carolina.

Despite the lack of resolute action on the part of the British colonies, the European powers responded to the events in the Ohio Country with unusual speed and strength. With a larger navy and a smaller army than France, London concluded that it was preferable to engage the French on this distant overseas battlefield and thus avoid French strength on land in Europe. About the same time, Paris concluded that a war in North America would divert British ships and troops from more vital targets, such as the Caribbean islands or France's own ports.

Although technically the two countries were still at peace, in 1755 Britain sent Major General Edward Braddock to Virginia with two understrength Irish regiments. His orders were to fill them out with American recruits and to recruit two entirely new regiments in the colonies. With Braddock's arrival, two colonial notables were also commissioned as major generals, although neither had any military training. William Johnson, a Mohawk River Valley landlord, was put in charge of provincial troops from Massachusetts and New York and made exclusive agent for negotiations with the Iroquois. William Shirley, the governor of Massachusetts, was made second-in-command of British forces in North America and would serve for a time as commander after Braddock's death.

The French responded to the Ohio Valley events by dispatching 3,000 regulars to Louisbourg and Canada. The ships transporting them largely managed to avoid the British warships sent to intercept them. France also sent a new governor-general, Pierre de

Rigaud de Vaudreuil de Cavagnial. This Canadian-born official had a much better understanding of both New France and its Native American allies than the rapid succession of military commanders who had recently passed through the governor-general's office.

The British planned simultaneous campaigns for 1755 against the four French outposts deemed the most egregious violations of their territorial rights—Fort Duquesne, Fort Beauséjour, Fort St. Frédéric, and Fort Niagara. Beauséjour and the newer Fort Gaspereau, which stood nearby, were surprised and fell with little resistance.

Although his move was uncharacteristic of 18th-century warfare, the British commander in Nova Scotia decided to secure his rear by expelling the entire Acadian population unless they pledged an oath of loyalty. The Acadians, whom the French authorities had also considered insubordinate, had formed their own separate identity, traded openly with both the French and the British, and steadfastly insisted on neutrality. To the British, however, they remained a "suspect" people who, if nothing else, got along too well with the "savages" who had so long harassed New England.

Thousands of Acadians were packed onto ships and scattered along the eastern seaboard of North America. Others escaped into the woods. Many of the survivors eventually returned or reassembled in Louisiana, where their name was distorted to "Cajun."

Elsewhere, events fared better for the French. On Lake Champlain, Major General Jean Armand, Baron de Dieskau, a German officer in the French service and commander of the French regulars in America, ambushed Major General William Johnson's forces before they reached Fort St. Frédéric. The French then built Fort Carillon (Ticonderoga) farther south, near the confluence of Lake Champlain and Lake George. Johnson responded with the construction of Fort William Henry at the opposite end of Lake George, establishing that lake as a de facto border barely north of Albany. (The engagement was depicted as a significant victory by the British side, and Johnson was made a baronet.) Farther to the west, Major General William Shirley's forces, assigned to take Fort Niagara, failed to advance beyond Oswego, at the eastern end of Lake Ontario.

The biggest news, however, came from the Ohio Country. There, Braddock's advance force of 1,450 regulars and militia were ambushed on the Monongahela by 637 Native American warriors, 146 Canadian militia, and 108 troupes de la marine. The British were sent reeling back to Virginia. The colonial wars had generally begun with a French raid, which often bolstered their position with their Native American allies. But never had there been anything so dramatic as this. The Ohio Native Americans, abandoned and cut off from the British colonies in any event, reaffirmed their ties to New France. Subsequently, the French and their allies conducted raids from Fort Duquesne with the intention of tying down British forces in the west.

Confronted with the disaster of Braddock's defeat, London responded resolutely in 1756. It shipped another 1,000 regulars across the ocean, ordered the formation of four more new regiments in the colonies, and subordinated all military and political

authorities in the colonies to a new commander in chief, John Campbell, Lord Loudoun. France also dispatched about 1,000 more regulars and a new commander, Louis-Joseph, Marquis de Montcalm, who would argue at great length with his superior, Governor Vaudreuil, over the appropriate conduct of the war. In May 1756, Britain and France finally declared war.

The French maintained the offensive in 1756 and 1757. In particular, they addressed what they considered the final contested territory, Oswego. In February 1756, they destroyed Fort Bull, cutting off Oswego's supply route from Schenectady. In July a 3,000-man force destroyed Oswego itself, securing Canada's flank and communications on Lake Ontario while exposing New York from the northwest. Fear and recrimination became widespread in the middle colonies. Colonial forces, and even some British units, began to incorporate Native American styles of fighting in their procedures. This was especially the case with the "Rangers," established by Robert Rogers, a New Hampshire frontiersman.

The following year, 1757, Montcalm, with 3,600 French and Canadian troops and 1,500 Native Americans, fell upon Fort William Henry at the south end of Lake George. The garrison surrendered after a siege, and Montcalm permitted his prisoners to return to their lines after they pledged not to engage the French in combat for 18 months. Montcalm's Indian allies, however, seeing this behavior as a violation of promises made to them, attacked the freed prisoners, seized captives, and then went home. The "Massacre at Fort William Henry" became a rallying cry for the British and a humiliation for the French. Again New York lay exposed, but with the season advancing and his allies abandoning the field, Montcalm dropped further plans for attacking Fort Edward and Albany.

A dispute ensued between Vaudreuil and Montcalm over the conduct of this campaign, after which King Louis XV transferred overall military command in Canada to Montcalm. The war was now to be fought on European terms, with concentrated armies in the Canadian heartland. It was not to be waged with Native Americans and raiding parties attacking frontier outposts and supply lines from forward positions. However, having considered Montcalm's defeatist view of Canada's strategic situation, despite a string of victories in the field, the king believed it prudent not to expend many more soldiers on its defense. Only 500 more reinforcements were sent out, raising New France's regular troop strength to about 6,000 men.

Britain responded differently to the trend of events. King George II placed William Pitt, leader of the House of Commons, in charge of the war effort in 1757. Pitt brought new determination and resources to the war. In Europe he paid subsidies to Britain's hardpressed ally Prussia and took over payment of the Hanoverian army in a futile attempt to avoid sending British troops to the Continent. In North America, he treated the colonies like allies rather than subordinates, rescinding the British commander's counterproductive political supremacy, elevating the status of colonial military units, and promising compensation for the colonies' war expenses. The number of British regulars stationed in North America grew to 20,000 men, in addition to 22,000 colonial troops and militia. Although the program was immensely expensive, over the next years Britain's forces carried out a slow, plodding, but ultimately successful replay of the four-pronged strategy of 1755 in Nova Scotia, Lake Champlain, Lake Ontario, and the Ohio River Valley.

The campaign began with a strategic setback in July 1758 as Major General James Abercromby, the new British North American commander, failed in an attempt to take Fort Carillon (Ticonderoga) on Lake Champlain. Within days of that, however, Louisbourg surrendered to Brigadier General Jeffrey Amherst. This success led to Amherst's replacing Abercromby as commander. In August, Lieutenant Colonel John Bradstreet crossed Lake Ontario and destroyed Fort Frontenac, a key stronghold connecting the St. Lawrence Valley with the upper Great Lakes. In November, Fort Duquesne, short of supplies since the fall of Fort Frontenac, was abandoned by its Indian allies and then abandoned and destroyed by its own garrison as Brigadier General John Forbes advanced across southern Pennsylvania.

With the fall of Fort Duquesne, New France's Native American allies in the west began reevaluating their position. The Iroquois Confederation, perceiving the shifting trend and anxious to renew its lost position among the Ohio River Valley tribes, in 1759 ended more than half a century of neutrality and openly sided with the British.

This Iroquois decision opened the way for the British to Fort Niagara. When 2,000 troops and 1,000 Iroquois warriors under Brigadier General John Prideaux and Major General William John-son laid siege to Niagara, New France's allies (including some Seneca Iroquois) conferred separately with the Iroquois of the British force and then withdrew from the field. The Niagara garrison surrendered in July. The French then abandoned their remaining outposts in Pennsylvania, now completely isolated from the east, and withdrew these garrisons to Detroit.

The French gave up Fort Carillon and Fort St. Frédéric in rapid succession in July 1759 as Amherst's forces approached, and Montcalm consolidated his forces in the core Canadian territory of the St. Lawrence Valley. Quebec fell in September, after two European armies met in a rare conventional battle on the Plains of Abraham. Both Montcalm and the British field commander, Major General James Wolfe, died on the battlefield.

Also of significance were the Royal Navy's decisive victories over the French fleets at Lagos Bay (Portugal) in August 1759 and Quiberon Bay (Brittany, France) in November 1759. These successes left the British in control of the Atlantic. New France now had no hope of further supplies or reinforcements from Europe.

The fate of New France seemed sealed, yet the French were reluctant to concede. François-Gaston de Lévis, Montcalm's deputy and successor, counterattacked at Sainte Foy in April 1760, defeating the British forces on the Plains of Abraham. He then laid siege to British-held Quebec. The arrival of a British fleet on the St. Lawrence, however, forced Lévis back toward Montreal in May.

As at Niagara, a small Iroquois contingent accompanying the British persuaded New France's remaining Native American allies to withdraw. Indeed, the Indians, much of the Canadian militia, and even some of the French regulars simply melted away. Lévis consolidated the remaining French regulars and troupes de la marine around Montreal. British, colonial, and Iroquois forces approached from three directions, along the St. Lawrence River from Quebec and from Lake Ontario and along the Richelieu River from Lake Champlain. On September 8, 1760, surrounded, outnumbered, devoid of provisions, and presented with relatively lenient terms, Vaudreuil overruled Lévis and surrendered all of Canada to Amherst. Technically, Louisiana remained at war until the peace treaty was signed in 1763.

The following month, George II died. His grandson, George III, was far more frugal and far less interested in the war, which was going less well in Europe. The new king dismissed Pitt and opened negotiations with the French for a separate peace. The new government, however, found it difficult to extract itself from the ongoing war, especially with Pitt vocally accusing it of abandoning Britain's Prussian ally. Prussia, indeed, appeared on the verge of defeat by the end of 1761, but Elizabeth, then empress of Russia, suddenly died. Her successor, Peter III, was an open admirer of Prussia's Frederick II, and he promptly withdrew from the war. Although Peter was soon overthrown, his action was decisive. Russia did not reenter the war.

France sought to bolster its position by enticing Spain into the war on its side. Spain agreed out of concern that Britain was growing too powerful and too aggressive. Spain, however, proved weaker than expected, and British forces soon took Havana (Cuba) and Manila (the Philippines). By now France was ready to be done with the war, but Spain refused to stop without the return of its two key colonial ports in Manila and Havana. France finally agreed to compensate Spain itself, quietly offering New Orleans plus all Louisiana west of the Mississippi. The latter was a vast area, but one that France had never developed.

The war ended with the Treaty of Paris on February 10, 1763. The French empire in North America was at an end. France ceded all of Canada and all of Louisiana east of the Mississippi, save New Orleans, to Britain. France's position in India was also curtailed.

In financial terms, France's fate was less harsh because holding Canada had become far more expensive than the revenues it generated. Under the treaty's terms, France also retained access to lucrative Newfoundland fishing grounds and kept important sugar islands, such as Martinique and Guadeloupe, in the Caribbean. The British briefly considered giving back Canada, in which it had no particular interest apart from negating the French military threat, and keeping Martinique and Guadeloupe instead, but sugar growers in the British Caribbean objected to the added competition and the British authorities had already suffered considerable acrimony for returning Louisbourg in 1748.

At home, France threw itself into a complete overhaul of its army and navy, extending its modernization to equipment, administration, recruitment, and training techniques. For its part, Spain, in addition to New Orleans and western Louisiana, did receive Havana and Manila back from Britain. But it ceded Florida to the British as compensation.

The war's outcome was startling, to say the least, to those French settlers and traders who had expected conditions to return once again to the status quo ante bellum once all the treaties had been signed. It was also shocking to the many Native American peoples who had allied themselves with New France for generations and had come to rely on it. Whether they were allies out of conviction or simply to balance the power of the British colonies, they now found themselves confronted with the British colonies utterly alone. Even for allies of the British, it proved an uneasy situation as diplomats in Paris argued over which European power owned the lands the Native Americans considered theirs.

Pontiac's Rebellion

The British had promised in the Treaty of Easton (1758) to reserve the vast expanses west of the Appalachians for the Native Americans. That promise had contributed to the decision of the Delaware and other tribes to abandon the French at Fort Duquesne. Nonetheless, British forces quickly took possession of New France's western forts, starting with Fort Duquesne (rebuilt as Fort Pitt) that very year. Traders and settlers soon moved into the Ohio Country and other Native American territories. Seeing no further need to buy the loyalty of the Indians, Amherst suspended the practice of ritualized gift giving as an economy measure. The French had assiduously followed that tradition, and many Native Americans viewed it as both a sign of respect and a pledge of peaceful intentions. Thus they viewed this action as an ominous sign from the British as well as a direct economic threat to the tribes and a political threat to the established chiefs, who redistributed the gifts to strengthen their own tribal authority.

The first eruption of violence occurred on the southern frontier, where the Cherokee had long been favorably inclined toward the British. As early as 1759, hostile Cherokee factions attacked recently established settlements and forts in the western Carolinas. British regulars led punitive campaigns against Cherokee villages with little regard for the factions to which they adhered. The Cherokee fought alone, although they had solicited aid from numerous peoples, including the French of Louisiana. The ability of the latter to help, however, was undermined by the British control of the seas. Still to come was Pontiac's Rebellion (1763), an attempt by a large, multiethnic Native American coalition to drive European settlers from their territory.

A number of Delaware shamans had already been arguing that the sufferings of the Native Americans were a consequence of their dependence on Europeans and European trade goods. The future, they maintained, lay in a spiritual reawakening and renunciation of their dependencies. As early as 1760, individual tribes were proposing a joint operation to "oust" the British. Some openly expressed wishes for the return of the French, which led many British officials and colonists to assume that French conspirators were behind the sentiments. By 1763, as the terms of the Peace of Paris came to be known, a loose coalition of peoples from the upper Great Lakes and Ohio River Valley—including the Missassauga, Ottawa, Potawa-

tomi, Ojibwa, Wyandot, Miami, Kickapoo, Mascouten, Delaware, Illinois, Shawnee, and Seneca Iroquois—joined behind that goal. All had been allied at some point with the French, most of them for a prolonged period. Pontiac, an Ottawa leader who played a prominent role in the early stages of the war, initiated a siege of Detroit in May 1763. During the next two months British outposts in modern-day Indiana, Michigan, Ohio, and Pennsylvania came under attack. Nevertheless, the key forts—Detroit, Pitt, Niagara—held out. Thousands of traders and settlers were killed or driven out of the frontier regions claimed by Pennsylvania, Maryland, and Virginia. Native American forces, however, were ill suited for siege warfare. Moreover, without a European ally, they ran low on ammunition and other supplies. After some months, the siege of Detroit began to fall apart.

A turning point came when Colonel Henry Bouquet, a Swiss officer in the British service, relieved Fort Pitt after defeating an attempted ambush by the Shawnee and Delaware at Bushy Run. Another key turning point was the Royal Proclamation of 1763, restating the earlier promise that British settlement would remain to the east of the Appalachians. This left the western lands reserved for the Native Americans. Moreover, Sir William Johnson, the superintendent of Indian Affairs for the Northern Department, advocated a return to the gift-giving rituals, arguing that this was far cheaper than large military expeditions.

The Indians' diplomatic position eroded as French authorities in Louisiana informed Native Americans and French traders alike that they no longer considered themselves at war with the British. In 1764 two British columns advanced westward along Lake Erie and the Ohio River.

British authorities attempted to negotiate with the rebellious populations, with mixed results. Certain nations, seeing the royal proclamation as vindication, fell way from the coalition and negotiated terms. Finally, Pontiac himself was captured and was called upon to represent the entire coalition in peace talks. Each side claimed victory, a most unusual situation in the history of the North American Indian wars. The return to gift giving and the announcement of the proclamation line would win Indian allies for the Crown during the upcoming American Revolutionary War. Colonists, who insisted on their right to expand westward, saw the proclamation line as a sellout of their interests to the benefit of the "savages."

An Unsettled Peace

Despite the end of the French and Indian War and the suppression of the Native American rebellions, true peace had difficulty taking hold in North America. Some ruptures came as offshoots of previous wars, as in the case of the "Paxton Boys" of Pennsylvania. Irate at the colony's inability to protect them during Pontiac's Rebellion, they massacred dozens of peaceful Conestoga in December 1763 and then marched on Philadelphia to attack Christian converts being held in protective custody. Their number grew to 500 by the time they reached Germantown, where troops armed with artillery finally dissuaded them from their course.

On the frontier, conflicting land claims led to clashes. The Proclamation of 1763 still permitted Native Americans to sell land west of the mountains if they wished. In 1768, invoking their authority under the Covenant Chain, the Iroquois agreed to sell the Shawnee-and Delaware-inhabited territory between the Appalachian Mountains and the Ohio River. The Cherokee, who had a rival claim to the territory, also agreed, but the actual inhabitants did not.

Pennsylvania and Virginia, which still laid claim to the Forks of the Ohio, issued conflicting grants of land in the new territory. The two colonies established overlapping counties, and each colony proceeded to arrest each other's settlers and officials. In 1774 Virginia seized Fort Pitt and renamed it for its governor, Lord Dunmore. In the meantime, the Shawnee had begun raiding Pennsylvania and Virginia settlers, to which Virginia responded by launching Lord Dunmore's War against the Shawnee. This effectively opened the area to European settlement; it also precluded any English-Shawnee alliance during the American Revolutionary War.

Other conflicts revealed further unsettled disputes between colonies. Vermont had been definitively secured from the French, but both New York and New Hampshire laid claim to it. The Privy Council officially awarded it to New York in 1764, yet both colonies continued to grant deeds to the same Vermont lands. This created tenure disputes that eventually resulted in Vermont's secession during the Revolution.

In northeastern Pennsylvania, farmers claimed and settled the Wyoming Valley in the name of Connecticut. This triggered the Yankee-Pennamite Wars, a string of armed disputes between Pennsylvania and Connecticut settlers, beginning in 1769.

In addition, some conflicts revealed social tensions within the colonies. Already by midcentury New Jersey was being torn apart by disputes between the colonial proprietors and "squatters," who had appointed their own courts, militias, and tax assessors. Disgruntled and rebellious tenant farmers disrupted New York's Hudson River Valley. In fact, the first instance of British regulars firing on colonial civilians occurred there in 1766, four years before the Boston Massacre.

In North Carolina, the Regulators, frontier farmers fed up with corruption and mismanagement, attacked courts and officials until the militia defeated them at Alamance Creek in 1771. In South Car-olina, another group of people who called themselves the Regulators wanted nothing more than to police the ill-secured frontier themselves, since the authorities refused do it. They too were declared rebels and violently suppressed. Unrest was also frequent in the cities, but colonial authorities did not apply the same ruthlessness against urban rioters that they showed to rural rebels because the urbanites were not as numerous, organized, or well armed.

Empire Rejected: From Triumph to Revolution

Colonial North America had evolved considerably over the previous century and a half. France had lost its huge but sparsely populated empire, although many of the settlers remained. Spain had

moved even further to the margins of power. The British colonies had grown from small, isolated, vulnerable, and often starving coastal settlements to integral parts of a transatlantic economy: supplying Europe with tobacco, whale oil, rice, furs, and skins; supplying the Caribbean islands with timber and with food for slaves (permitting the plantations there to concentrate on high-profit sugar production for the European market); and providing markets for European manufactures and enslaved Africans.

The colonies' relationship with the Native American population had also changed since the time when fractious little colonial settlements sided with one Native American group against another in return for protection and sustenance. The Spanish established a string of mission settlements, but then largely lost them to the attacks of the Carolinians and their allies. The French relied on an extensive Native American alliance system to both operate a farflung commercial enterprise and help defend it from the British and the Iroquois, but at the last minute they abandoned those allies in a failed attempt to fight a European-style war without access to European reinforcements or supply lines.

The British colonies had a particularly mixed record with the Native Americans. There were times and places where peace and cooperation prevailed, but the colonists planned to clear and settle the land, relied far more on their own growing numbers than on Native American allies, and often viewed the Indians as a hindrance and a threat. Relations were improving in the latter years of the French and Indian War, but then collapsed in the flames of the Cherokee and Pontiac rebellions. The removal of French power from the scene, and the consequent lack of a counterweight to British power, dealt a severe blow to the Native Americans' strategic position.

Finally, the wars among the Europeans in America also evolved, even if in some sense the British and the French fought the same war four times. The first one, starting in 1689, was a fairly amateurish affair conducted by colonial militias and Native American allies with the European mother countries providing little support or guidance and paying little attention. As the series of wars progressed, provincial forces became somewhat more professional; more assistance was promised, although it did not always materialize; and finally, European fleets became involved. In the French and Indian War, professional European armies virtually took over the war effort on both sides. Still, it is noteworthy that British relations with Native American forces were beginning to improve as New France's relations deteriorated. Turning points in the war corresponded with major shifts in Native American alliance politics.

By 1763, final victory at last appeared to be at hand. Indeed, historian Fred Anderson has called it the most complete victory in any European conflict since the Hundred Years' War (1337–1453). That victory, however, marked both the highpoint and the beginning of the end of the British Empire in North America. Within two decades the colonies of the Atlantic seaboard would break away (although the more marginal colonies of the north—Newfoundland, Nova Scotia, and formerly French Canada—and the prosperous but

overwhelmingly slave-dependent islands of the British Caribbean remained loyal (Florida returned to Spanish control). The seeds of this rapid imperial collapse were sown by the British victory.

In expelling the French, the British had eliminated the threat (the "negative factor") that had helped hold mother country and colonies together. Without the French in Canada, the colonies did not see the need for the continued presence of the British Army. There was still the long-term "Indian menace," and colonial hostility toward the Indians was high in the wake of Pontiac's Rebellion. Still, the rebellion had been successfully suppressed and, more important, the colonists were quick to assume that the French had been the true instigators. To many colonials, the French and Indian threats had merged.

Nevertheless, this is when the British decided to station some 10,000 troops in North America on a permanent basis. Forced by the French and Indian War to pay attention to the North American colonies, British authorities discovered that they had become relatively prosperous. Indeed, commoners enjoyed a higher standard of living in the colonies than in Britain. Many colonists had come to think of themselves as "landowners," a tremendous affectation in a country where aristocrats owned the land. Compared to the British at home, moreover, the colonists were significantly undertaxed. Finally, the colonists had held the laws of trade (which, to be sure, had been designed to favor metropolitan over colonial interests) in flagrant disregard, even to the point of trading with the enemy in wartime.

The British had expended enormous amounts of blood and treasure to preserve and expand the North American empire, and now London was determined to see that it was managed properly. That meant enforcing rules that had gone unenforced for decades, which would have a general negative economic impact and would especially generate resentment among the numerous violators. Furthermore, the British intended to shift some of the burden of repaying the war debt onto the colonists.

Sharing the burden may not have been unfair in and of itself, but colonial leaders were quick to see the implications of the way in which it was being done. Once members of Parliament, elected by voters in England, learned that they could make someone else's constituents pay the bills, where would it end? The colonists (at least those who were not slaves or indentured servants) had struggled long and hard to have their own elected assemblies, to have decisions on taxes and expenditures decided by their own representatives. Those assemblies had actually grown stronger vis-à-vis the king's governors as a result of the war. Now London was imposing its will on those institutions, again treating the colonies as subordinates rather than allies.

This came as a blow to colonists who, during the war, had come to view themselves as partners in empires, not to mention equal British subjects and "landowners." Now, it appeared to many colonists, the purpose of the British troops was to enforce the collection of foreign taxes in order to support the oppressive presence of British troops. All this helped undermine the affective ties (the "pos-

Overview of the North American Colonial Period lxi

itive factors") that had helped hold mother country and colonies together. It also aggravated existing political divisions within the colonies. As colonial society was far from monolithic, various factions and interests took different sides in the evolving debate.

The overall effect was reinforced by other circumstances, also tied to the recent wars. The new British tax proposals came at a time when the curtailment of war-related spending had pushed the colonial economy into depression. The attitudes of aristocratic British officers during the recent war had offended the sensibilities of

colonists, especially in relatively egalitarian New England. George III's proclamations of 1763, made in the name of preserving peace and stability, were seen as defending the interests of "savages" and French Catholics over those of his own colonists (who, to be sure, were eager to expropriate the lands of the "savages" and French Catholics). The result was a rapid escalation of tensions and the development of an imperial crisis, an explosion known as the American Revolution.

SCOTT C. MONJE

Abatis

An obstruction placed in front of a field fortification. The word "abatis" comes from the French *arbes abattus*, which roughly translates as "felled trees." These obstructions were trees placed in a row in front of the earthworks. The branches of the trees were placed in a solid front facing the direction of a possible enemy assault. The trees were secured with their trunks into the ground and braced with either chains or ropes. The branches were intertwined to screen the front of the defensive works. If allowed to dry, the branches would become a strong barrier to attacking infantry, who would be forced to use axes to cut through the screen while being subjected to small-arms fire.

One of the most effective uses of the abatis was at the Battle of Fort Carillon (Fort Ticonderoga) on July 7–8, 1758, during the French and Indian War (1754–1763). In this engagement, the French forces used an abatis to screen the only land approach to the fort. The British attempted a frontal assault and suffered heavy losses while trying to cross the abatis in front of the French positions. They were forced to retreat with heavy losses.

Abenakis

Principal Native American nation of northern New England and allies of the French in nearby Quebec. The Abenakis represented a serious political and military impediment to English imperial expansion in the region. New Englanders often referred to the Abenakis as the "Eastern Indians," a term that ignored divisions between the western Abenaki bands of Vermont and the eastern Abenaki bands of Maine, or as "French Indians," which denied their autonomy and obscured their relations with other natives. Indeed, the Abenakis themselves preferred the name "Wabanaki" to express their affiliations with tribes such as the Passamaquoddy and the Micmac to the north.

The Abenakis joined Metacom's forces in a failed attempt to keep encroaching English colonists off their lands during King Philip's War (1675–1676), after which they incorporated remnants of shattered southern New England tribes into their ranks. They also increasingly collaborated with the French, joining with them in assaults against English settlements in Maine, New Hampshire, Massachusetts, and New York. Contrary to English assumptions, the Abenakis were not the simple subordinates of French officials. Rather, they maintained their own interests and objectives in these raids.

Much of the contemporary stereotype of the Abenakis as merciless savages stems from their involvement in attacks against weakly defended, peripheral New England towns in the late 17th and early 18th centuries. During King William's War (1689–1697), for instance, they targeted settlements at such places as Salmon

2 Abercromby, James

Falls (now Rollinsford) and Oyster River (now Durham) in New Hampshire. In January 1692, a band of approximately 500 Abenaki warriors launched a devastating attack against York, Maine, that killed upward of 80 inhabitants, left the town in shambles, and seared itself into New Englanders' collective memory as the Candlemas Massacre. The Abenakis were also among the tribes that participated in the devastating attack on Deerfield, Massachusetts, during Queen Anne's War. Indeed, many of the towns that fell victim to Abenaki attacks in this period still commemorate the events with local markers and tablets that perpetuate the image of the Abenakis as aggressively bellicose.

Yet the Abenakis were as often the victims of raids as they were the perpetrators. Puritan New Englanders considered them heathen and felt justified in seizing Abenaki lands and scattering their settlements. Mistakenly convinced that French political and religious leaders were behind several Abenaki attacks against expanding English outposts in the 1720s, New England soldiers under the command of Captain Jeremiah Moulton assaulted the Abenaki village of Norrigewock in 1724 and carried away the scalp of Sébastien Râle, a French Catholic priest who had been working among the Native Americans for decades.

Despite their general contempt for the Abenakis, the English respected their fighting skills, especially those of Chief Grey Lock, for whom New Englanders would name a prominent peak in the Berkshire Mountains. But by the end of the colonial period, a combination of forces, from repeated outbreaks of disease to devastating English raids during the French and Indian War, undermined the Abenakis' ability to oppose English intrusions.

Abercromby, James

Born: 1706

Died: April 23, 1781

General in the British Army and commander during the French and Indian War. James Abercromby was born in 1706 in Glassaugh, Banffshire, Scotland. His powerful family purchased Abercromby a commission in the British Army and obtained for him the positions of commissioner of supply and justice of the peace in Banff-

Contemporary engraving of Major General James Abercromby, commander of British forces in America during the French and Indian War. (The Granger Collection)

shire. In 1734, Abercromby entered Parliament representing Banffshire, and in 1739 he was appointed lieutenant governor of Stirling Castle. Advanced to the rank of major in 1742, he was promoted to lieutenant colonel of the Royal Regiment of Foot, or the "Royal Scots," in 1746. During the War of the Austrian Succession, Abercromby served as quartermaster general in James St. Clair's 1746 expedition against Lorient on the coast of France and was wounded at Hulst in the Netherlands in 1747.

Because of his close political ties with the Duke of Newcastle, Abercromby was named second in command in America in 1756 with the rank of major general in North America and colonel of the 44th Foot. By then, the French and Indian War had been raging for two years. After serving as an uninspired subordinate to John Campbell, Lord Loudoun, Abercromby was appointed to succeed him as commander in chief in March 1758. He received this appointment despite his never having previously held an independent command in his long military career. Britain's prime minister, William Pitt, immediately ordered Abercromby to attack Fort Carillon (Ticonderoga) as part of the overall British strategy against Canada. Recognizing the dithering Abercromby's limitations, Pitt appointed the bold and robust Brigadier George Augustus Howe as his second-in-command.

By the beginning of July 1758, Abercromby had assembled an invasion force of 15,000 British regulars and American provincials. On July 5 the British made an unopposed landing on the north shore of Lake George. The following day, Lord Howe, while leading the

forward British elements advancing on Fort Carillon, was killed in a fierce skirmish with the French. The death of the charismatic Howe crippled the expedition's chances for success.

In the aftermath of Howe's death, Abercromby was unsure of how to proceed and only slowly moved to close up on the French positions. He disregarded the possibility of placing cannon on Mount Defiance, which could have forced a French surrender, or employing William Johnson's Iroquois warriors in an offensive role. Instead, after calling a council of war with his officers, Abercromby blundered in choosing to launch a frontal assault on the French lines without artillery support. This plan was not based on Abercromby's personal observation of the French positions but on the report of a junior engineering officer that the Marquis de Montcalm's lines were weak and could be stormed. On the afternoon on July 8 at the Battle of Ticonderoga, Abercromby shattered his force in successive attacks on the French entrenchments, none of which breached the enemy lines. After stunning casualties that included nearly 2,000 soldiers killed, wounded, or missing, the British abandoned the battle and retreated. In September 1758, Abercromby was dismissed and replaced as commander in chief in America by Major General Jeffery Amherst.

Despite his miserable performance, Abercromby was promoted to lieutenant general in 1758 and advanced to the rank of full general in 1772. He returned to Britain and served in Parliament before dying in Glassaugh on April 23, 1781.

Absolutism

Theory of kingship whereby the monarch ruled a centralized state with absolute authority. Absolutism prevailed in Europe from the 15th century to the end of the 18th century. Possessing unlimited power, the monarch was in theory subject to no laws but those of God. The principle of absolutism was often used as a unifying force in the consolidation of nation-states.

The justification for absolutism came from various sources and traditions. Above all, two influential figures validated the theory in

Portrait of Jacques-Bénigne Bossuet, who affirmed that absolute power could be justified through the divine right of kings to rule. This belief was known as absolutism. (Ridpath, John Clark, *Ridpath's History of the World*, 1901)

the 17th century. In France, Bishop Jacques-Bénigne Bossuet affirmed that absolute power could be justified through the divine right of kings to rule. This was an authority given to monarchs directly by God. Because the monarch was God's representative on Earth, his decisions became unquestioned law. English political theorist Thomas Hobbes, on the other hand, justified absolutism politically rather than religiously. In *Leviathan* (1651), Hobbes wrote that absolute monarchy was the only system of government capable of maintaining order among the unruly masses.

Practical considerations also accounted for absolutism. After the events of the calamitous and chaotic 14th century, people were ready to accept a strong monarch. The Protestant Reformation contributed to absolutism as well. Papal influence had weakened in many states, and secular affairs required guidance from a powerful ruler. To establish order and control, monarchs required a bureaucracy, which in turn helped to maintain central authority. In addition, 15th-century mercantile policies, which produced unimaginable wealth, contributed to the rise of absolutism. The mercantile notion of a national, self-sufficient economy stimulated production and generated surpluses. To maintain that prosperity, monarchs regulated all aspects of economy and built large navies to protect their trade.

Absolutism first appeared in Spain, where dynastic marriages had significantly increased the Habsburg's territorial holdings. Holy Roman Emperor Charles V (1519–1556) ruled over nearly half of Christian Europe in the 16th century. He was also nominally the secular head of the Roman Catholic Church. Yet the Protestant Ref-

ormation threatened to divide his Catholic kingdom. When King Philip II (1556–1598) succeeded his father Charles over the Spanish half of the empire, he firmly applied the divine right theory. Philip made every decision and micromanaged his expansive bureaucracy. He conquered neighboring Portugal, united the two thrones, and took over Portugal's overseas territories. Substantial income poured into the Spanish treasury.

French absolutism became the prototype for all the other European monarchies. Absolutism emerged in France partially in response to a rebellious aristocracy that had embroiled the country in internal conflict. Determined to suppress the nobles, King Louis XIV (1643–1715) took personal control of government in 1661. Louis believed deeply that he was God's lieutenant on Earth, and he was ruthless in his suppression of anyone who questioned his authority. He crushed the Protestant Huguenots and forced obedience to his decrees in the law courts. He also diminished the power of autonomous French towns. His ministers, who were totally obedient to him, helped cement the king's power. Louis also fought several major wars between 1667 and 1713. They were meant to enhance his prestige, enrich France, and place a French Bourbon on the Spanish throne. Indeed, Louis XIV came to be known as the Sun King, around whom all else revolved.

Absolutism developed differently in England. Although absolutist, the Tudor dynasty (1485–1603) achieved its objectives through adept and popular rulers. Tudor monarchs worked with the British Parliament to augment their power. With the Scottish Stuart dynasty, absolutism became more pronounced. James I (king of England and Scotland, 1603–1625) asserted his divine right to rule. But his arrogance caused many in England to resent his power. In turn, policies pursued by his son, Charles I (1625–1649), caused a constitutional struggle. After repeated disputes with Parliament, Charles dissolved the body and ruled alone during the so-called Eleven Years' Tyranny. In 1642, however, the English Civil War broke out as Parliament rose against Charles and his supporters. The victory of Parliament's New Model Army resulted in the overthrow of the monarchy and the execution of Charles in 1649.

After several years of rule by Lord Protector Oliver Cromwell, the Restoration brought Charles II to the throne in 1660. Realizing that absolutism would fail, Charles used favors to gain parliamentary support for his policies. When Charles died, however, his devoutly Catholic brother, James II (1660–1688), soon ran into struggles with Parliament. After deeming that James had abdicated, Parliament offered the throne to the Protestant Mary II and William III in what came to be known as the Glorious Revolution.

In sum, the British Parliament had won the absolutism battle by deposing and appointing monarchs as it saw fit. The theory of the divine right of kings had been dealt a devastating blow. John Locke justified Parliament's actions in 1690 by arguing in favor of legitimate revolt against any type of tyrannical government. Locke's theories contributed to the American Revolution and the French Revolution.

In Russia, absolutism had existed since the reign of Ivan III in the 15th century. In the early 1700s, monarchs ruling the Holy Roman Empire attempted to establish their own brand of absolutism on the far-flung confederation. In Prussia, King Frederick I (1701–1713) established the Hohenzollern family as an important dynasty. With the help of a full treasury and a small but powerful army, he made Prussia a formidable player in European politics. Variations of absolutism also existed in Denmark, Sweden, and the Ottoman Empire. Yet after the French Revolution (1789), absolutism began to decline.

Acadia

A long strip of land variously described and claimed by European explorers along North America's Atlantic coastline, stretching from Florida all the way to the Arctic, though the term "Acadia" came to denote an area from Quebec, Canada, through the Canadian Maritime provinces, south to Maine and northeastern Massachusetts. During the colonial wars of the 17th and 18th centuries, the French and English fought over who would possess and occupy this region. Although Acadia played a relatively limited role in the course of the wars, the English saw French control of it as a constant threat to their security and sovereignty. This region was the homeland of the Micmac, Maliseet, and Abenaki Native Americans. There are two probable origins of the word "Acadia." Italian explorer Giovanni da Verrazzano may have heard the Native Americans he encountered refer to "cadie" or "quoddy" and then assumed it referred to the territory on which they lived. Or he may have used the classical Greek and Roman term for a terrestrial paradise—"Arcadia."

Verrazzano first used the term "Acadia" in 1525 to refer to coastal North Carolina. "Larcadia" subsequently appeared on Giacomo

Marc Lescarbot's map of Port Royal in 1609. Port Royal, Acadia (Annapolis Royal, Nova Scotia), was settled by the French in 1605 and was the site of repeated conflict between the French and the English. (The Granger Collection)

Gastaldi's 1548 map near Cape Cod, Massachusetts, and then on Bolognino Zalttieri's 1566 map of Nova Scotia. By the mid-1600s, "Acadia" generally referred to the land nestled between Quebec and New England. In 1603, the French laid claim to a vast but ill-defined territory stretching from Florida to the Arctic Circle. King James I of England subsequently granted Nova Scotia to Sir William Alexander in 1621. Acadia, excluding Cape Breton Island and Prince Edward Island, was ceded to Britain under the 1713 Treaty of Utrecht.

In the 17th century, the major French settlement and administrative center in Acadia was Port Royal (in present-day Nova Scotia). Despite the granting of 55 seigneuries, this quasi-feudal land system never provided much stability, social organization, or leadership in the colony. After the cession of Acadia to England in 1713, the French constructed a new fortified settlement at Louisbourg on Cape Breton Island. This settlement served as the French military, administrative, and trade center on the Atlantic. The main areas of French settlement in Acadia were Port Royal, Les Mines, and Beaubassin along the Bay of Fundy. In 1650, Acadia had a French population, known as Acadians, of 400 to 500. By 1714 that num-

ber had increased to about 2,500; and by 1754 there were about 13,000 Acadians. Acadia provided its colonists with livelihoods through trapping, trading, farming, fishing, and smuggling. In 1754, the British governor of Nova Scotia, Gov. Edward Cornwallis, fearful of the French and Micmacs, ordered the Acadians deported. Eventually many Acadians who had fled, hidden, or managed to return to New France established settlements in current-day New Brunswick. Meanwhile, English-sponsored settlers occupied land around Halifax and in the former Acadian communities.

Acadia, British Conquest of

Start Date: September 18, 1710 End Date: October 15, 1710

British offensive against French-held Acadia and the only demonstrable success of British and colonial forces during Queen Anne's War (1702–1713). By 1708, it had become apparent to many New England leaders that the British government did not place a high priority on military events in Canada, particularly with respect to the allocation of military resources. Prior campaigning with purely militia forces had invariably proved unsatisfactory, so in 1708 Gov. Joseph Dudley of Massachusetts began agitating for an influx of regular troops and naval vessels to stiffen future endeavors against Canada.

To this end the enterprising merchant Samuel Vetch, himself a former Scottish military officer, was dispatched to London to confer with governmental authorities on the subject. The ensuing Canadian campaign of 1709 came to naught, but the following year Vetch again visited London and prevailed on the Board of Trade to augment colonial forces through the addition of several Royal Navy warships.

Rather than the conquest of Quebec, Vetch set his sights on the French settlement of Port Royal, Acadia (present-day Nova Scotia). Port Royal was chosen owing to its activities as a privateering center and a relatively weak garrison. The British then agreed to provide five warships and a contingent of 400 Royal Marines under the command of Colonel Francis Nicholson, another energetic colonial administrator.

A large contingent of British regulars had also been promised but never materialized. Nonetheless, the efforts of Vetch and Nicholson were also greatly abetted by Governor Dudley, who proved instrumental in cobbling together a diverse body of New England militia. It included two regiments from Massachusetts and one each from Rhode Island, Connecticut, and New Hampshire. The usually hesitant Yankees, fired more by profit than patriotism, also responded with a degree of cooperation heretofore rarely seen in the war.

By the fall of 1710, an amphibious expedition of 3,500 colonial troops and Royal Marines had assembled in Boston under the aegis of Commodore George Martin. They departed on September 18, 1710, confidently anticipating what appeared to be an easy conquest. The fact that the season was far advanced and that ongoing peace negotiations in Europe could end the conflict added greater impetus to their endeavors.

Port Royal, despite its strategic significance, was poorly garrisoned by a force of just 300 French soldiers and a number of Micmacs. Their leader, Gov. Daniel d'Auger de Subercase, had pleaded with superiors for reinforcements when intelligence of the impending invasion was ascertained. Such aid never materialized. Therefore, when the first of Nicholson's 3,500 troops disembarked from 31 transports at Port Royal on September 24, 1710, the outcome was a foregone conclusion.

Subercase, lacking manpower and even adequate supplies, determined to put on as good a show as limited resources would allow. His forces gamely engaged Nicholson's men with what few cannon he possessed. Nicholson and Vetch responded with an unhurried deployment of siege works and batteries, completed by October 6, which took a gradual toll on the French garrison.

On October 15, Subercase was persuaded by his subordinates to submit to terms of surrender, and he was granted honors of war. The French troops paraded out of the fort with colors flying and boarded several vessels for a return voyage to France. Once home, the governor was tried for neglect but acquitted.

Port Royal, Acadia, was renamed Annapolis Royal, Nova Scotia, in honor of Queen Anne. Considering its strategic significance, this was an impressive little victory by an enterprising New England military establishment.

With Annapolis Royal secured, Nicholson departed for Boston shortly after the surrender formalities ended and left a 500-man garrison in place. Vetch was then appointed the new military governor there, and for the next three years he administered his charge effectively, although with only sullen cooperation from the French and Micmac inhabitants. Worse, the Native Americans, once reinforced by a party of hostile Abenakis, began a concerted guerrilla war against isolated British outposts. Vetch grew disappointed at Nova Scotia's relegation to a backwater by authorities in London, and his command remained small and undersupplied.

By 1712 conditions had deteriorated to the point where Vetch warned superiors that Nova Scotia might have to be abandoned, a revelation that brought about his replacement by Nicholson in 1713. The sole consolation for New England forces involved in the capture and garrisoning of Port Royal was its formal transference to Great Britain by terms of the Treaty of Utrecht in 1713. Though small in terms of area, the loss of Port Royal was a serious blow to the already tenuous French foothold on North America, which grew successively weaker in the following two conflicts. Another result was to prompt Nicholson to venture to London, where he convinced the British government to commit even greater resources to the conquest of Canada. Indeed, success at Port Royal proved the genesis of the ill-fated expedition against Canada in 1711.

Acadia, New England Attack on

Start Date: April 28, 1690 End Date: June 1690

The first English colonial offensive of King William's War (1689–1697, known in Europe as the War of the League of Augsburg). The governor-general of New France, Count Louis de Baude de Frontenac, began the fighting in North America when he launched an attack on New York in 1690. Frontenac hoped to isolate the Five Nations, divide the English colonies, and safeguard the fur trade. To accomplish these ends, he unleashed a three-pronged offensive against the northern frontier of the English colonies, attacking Schenectady, New York; Salmon Falls, New Hampshire; and Casco, Maine. A number of English settlers were slain by Native Americans attacking with the French.

The repercussions of the devastatingly effective French offensive were immediate. A number of terrorized English colonists along the New England–New York frontier moved to safer areas. The French offensive aroused widespread anger, united the English colonists against New France, and fueled demands for revenge.

In the midst of Frontenac's offensive, Massachusetts began preparations for its own military operation, a seaborne attack on French Acadia, present-day Nova Scotia, New Brunswick, and Prince Edward Island. This was actually prompted by concerns that France was moving to restrict the lucrative New England fishing industry. The new governor of Acadia, Louis-Alexandre des Friches de Meneval, had been endeavoring to refortify Port Royal on the western coast of Acadia and to exclude New England fishing vessels from Acadian waters. French frigates from Port Royal had seized a number of Massachusetts fishing boats and their crews, threatening to end New England's fishing livelihood as well as its trading interests in the Bay of Fundy. In addition, the colonists saw Acadia as a base for operations against their own northern settlements.

Sir William Phips commanded the expedition, which departed Boston on April 28, 1690. It consisted of a regiment of 446 Massachusetts militiamen transported in seven vessels. Anti-Catholic bigotry and, more importantly, the promise of plunder, had served as a powerful recruiting tool. Consequently, the New England force was comprised largely of unemployed citizens and low-paid laborers. Phips's objectives were to capture Port Royal, destroy or capture French shipping, and seize other French settlements along the coast.

After raiding the French coastal settlements at Penobscott, Machias, and Passamaquoddy Bay on their way north, the New Englanders reached Port Royal on May 9. Meneval was short of supplies, and there was considerable discontent among the 70-man French garrison over conditions. In consequence, Meneval was persuaded to surrender Port Royal after only two days, on May 11. Under the terms of the surrender, French property was to be secure. The victors immediately violated this provision and, over a two-day span, plundered the town. After desecrating the Port Royal Catholic Church by pulling down its high altar and smashing religious

images, the overzealous New Englanders then razed the fort and carried off its artillery. Before departing, Phips forced the local residents to swear an oath of allegiance to the British Crown. He also appointed a council headed by a French sergeant, Charles La Tourcasse, to govern Acadia under the jurisdiction of Massachusetts.

After sending off smaller forces to attack other French communities in Acadia, the victorious Phips returned to Boston by the end of the month, along with the plunder and 60 French prisoners, including Meneval. The operation was a great boon to Phips's ambitions. Despite his failure to capture Quebec in a much larger expedition in 1690, the success against Port Royal helped make Phips governor of Massachusetts in 1692. Some participants were also enriched.

In June, warships from New York again attacked Port Royal, with more destruction and the killing of several civilians. Any geopolitical advantages were fleeting, as no English force had been left behind to garrison the settlement and the French reclaimed the settlement the following year. Although the English victory had little strategic value, it served to bolster the morale of New England and served to unite the English colonists.

Acadia, New England Occupation of

Start Date: 1654 End Date: 1670

French Acadia was an area of continual dispute and conflict between the French and the British. At the beginning of the colonial period, Acadia comprised what is now Nova Scotia, New Brunswick, and Prince Edward Island, as well as portions of Quebec and Maine. Because of its strategic location south of the mouth of the St. Lawrence River and astride rich North Atlantic fishing grounds, Acadia was sought by both the English and French.

Acadia was in dispute early in the colonial period. It formed part of the original French grant to Pierre du Gua de Monts, but a portion of Acadia was also included in the 1620 grant to the Council of New England. In 1625, Samoset and Unongoit, both Sagamore chiefs, sold

12,000 acres of land that included Pemaquid and Bristol to English trader John Brown. The English further strengthened their claim in 1629 with the establishment of a trading post on the Kennebec River.

Both the French and the English claimed the region's rich fishing grounds, although the area between the Bay of Fundy and Marchais acted as a buffer between the two sides. In 1654, New England governor Thomas Temple encouraged successful attacks on the French outposts at Penobscot and Port Royal. The 1667 Treaty of Breda confirmed Nova Scotia as belonging to France, although the New Englanders did not abandon it until 1670. Nonetheless, the boundary between French and English territory was ill-defined, the French claiming it to be the Kennebec River. These disputes and the strategic importance of the region led to renewed fighting in 1688.

In 1688, Edmund Andros, governor of the Dominion of New England, asserted New England's claims in the region by promoting an attack against the French at St. Castin's trading post on the Penobscot River. The French retaliated by encouraging the Abenakis to mount raids on the English frontier settlements.

The formal outbreak of King William's War (1689–1697) brought a major New England operation against Port Royal, then an important base for French privateers. In 1690, William Phips led 450 men in a number of ships and took Port Royal (assisted by the fact that it was garrisoned by only 60 French troops). Phips required the inhabitants of the region to take an oath of loyalty to the British crown, but then made the mistake of leaving only a small garrison in occupation. The French soon recaptured it. Fighting resumed over Acadia during Queen Anne's War (1702–1713).

Acadia, Virginia Attack on

Start Date: July 2, 1613 End Date: October 1613

In May 1613, Samuel Argall led his ship the *Treasurer* and another vessel from the struggling English colony at Jamestown, Virginia, to attack the French colony at Mount Desert Island in what is now Maine. The English had shown interest in the region they called "North Virginia".

ginia" and had explored it in the 1570s and again in 1610. Although they had not been able to establish a colony in the region, the English did not wish to yield it to the French, their traditional rivals.

Argall and his expedition arrived at Mount Desert Island on July 2, 1613, and found the site poorly defended. The colony's leader, the inexperienced French nobleman René Le Coq de la Suassaye, had failed to take steps to fortify the colony adequately. After destroying that settlement and seizing Suassaye's records, Argall headed back to Jamestown with some 15 French prisoners and a captured vessel. Among the prisoners was Jesuit missionary Father Pierre Biard, who left a narrative of these events.

Argall and company returned to Jamestown to refit. In August or September they again set sail, this time for the Bay of Fundy to find the colony of Sainte-Croixe. They arrived there in late September or early October. The settlement had been abandoned, however, and Argall only secured some salt. He then destroyed the few abandoned buildings.

According to Biard's account, a Native American who previously had dealt with the French helped Argall find the settlement at Port Royal. That French colony, under the command of inexperienced 21-year-old nobleman Charles de Beincourt, was poorly protected, with most of the settlers scattered in the forests gathering food. Argall burned the few buildings at Port Royal, torched the fields, slaughtered some cattle for immediate use, and took some other livestock on board his vessel.

Argall then set sail for Jamestown. En route, his squadron was hit by a storm. One ship sank, and that carrying Biard ended up in the Azores. Argall's ship returned to Jamestown in late November or early December.

Argall's raids were part of the many conflicts between settlers of the different European powers attempting to colonize North America. This particular raid kept the French out of "North Virginia" and made the region an acceptable destination for the Puritan Separatists seeking to establish a colony in America in 1620.

Acadian Expulsion

Start Date: July 1755 End Date: 1762

Forced deportation by the British of the French inhabitants of Nova Scotia during the French and Indian War (1754–1763). When France ceded Acadia to England in 1713, the province had a large population

Expulsion of the Acadians by the English in 1755; a watercolor by Charles William Jeffreys. (Library and Archives Canada)

of French settlers concentrated along the western coast. Although the Acadians were peaceful farmers with little interest in imperial conflicts, British officials considered them a potential threat to their control of the province, which they renamed Nova Scotia. After the British established a settlement at Halifax in 1749, Gov. Edward Cornwallis also came to believe the Acadians were dangerous and recommended that they be removed from the colony. However, the Acadians did not interfere with the new British settlement.

When the French and Indian War broke out in 1754, the Acadian population numbered about 13,000. Fearing that the Acadians might aid the French, in July 1755 Lt. Gov. Charles Lawrence demanded that all Acadians take an unqualified oath of allegiance to Great Britain or face immediate deportation. The Acadians offered instead to make a pledge of neutrality and surrender their arms to the English. Lawrence and his council deemed the proposal unacceptable and on July 28 ordered the Acadians deported. Because Lawrence did not want to strengthen the French by sending the Acadians to a French colony, he ordered them to be dispersed throughout other British colonies and to England.

Employing 2,000 New England troops who had arrived to reinforce Nova Scotia, Lawrence rounded up as many Acadians as could be found and confined them at Annapolis Royal, Grand Pré, and other towns until they could be transported out of the province. Many Acadians fled to the woods while New England soldiers burned their homes and barns to deprive them of shelter. By the end of 1755, some 7,000 Acadians had been deported, and approximately 3,000 more were removed before the policy was ended in 1762.

Because the deportation was poorly planned, many Acadians died from hunger, thirst, and disease aboard overcrowded ships before reaching their destinations. Others died when their transport ships were wrecked. Although colonial officials attempted to provide for the Acadian exiles, poor living conditions led to additional deaths from disease and exposure. Virginia officials sent 1,000 Acadians deported there to England; these exiles were placed in internment camps and remained there for seven years before being sent to France. An estimated one-third of the deported Acadians—more than 3,000 people—died during their ordeal.

The survivors also experienced severe hardship as families and communities were broken up. British officials managing the deportation paid no attention to such matters as they crammed the exiles aboard ships bound for different destinations. Massachusetts, New York, Pennsylvania, Maryland, and all the colonies farther south received Acadian exiles. The French-speaking, Roman Catholic Acadians were not welcomed by their English Protestant neighbors, however, and thus remained isolated. After the war, large numbers of Acadian exiles from the British colonies traveled to Spanish Louisiana, a former French colony, and established new homes there. Others went to Nova Scotia when the British government permitted their return in 1764, but they often found that their former lands had been granted to settlers from New England.

Ackia, Battle of

Event Date: May 26, 1736

The key battle in the French-Chickasaw conflict of 1736, fought at the Chickasaw village of Ackia, near modern-day Tupelo, Mississippi. Europeans and Native Americans viewed each other as colonial allies in North America against their traditional rivals (France versus England and the Choctaw versus the Chickasaw, for example). Such was the context for the Battle of Ackia. The French hoped to link French Canada with French Louisiana via the Mississippi River and thereby contain the English colonies. Since the English enjoyed a 10-to-1 population advantage in colonists, French-native alliances were vital to French ambitions. But the English proved most successful in allying with the Chickasaw, whose lands bordered the Mississippi.

In the 1736 French-Chickasaw conflict, Gov. Jean-Baptiste Le Moyne de Bienville of Louisiana sought to split his forces and contain English influence at the Chickasaw villages of Ackia, Apeony, and Chukafalaya. On March 25, 1756, the Chickasaws had defeated French forces from Illinois under Pierre d'Artaguette at the Battle of Ougoula Tchetoka. Twenty Frenchmen, including d'Artaguette, were burned to death. This setback forced Bienville's hand, and he moved decisively against the Chickasaw-English alliance, employing his Choctaw allies. Chickasaw peace envoys were sent out on May 25, but they were killed and scalped by the Choctaws, who were eager to capture the Chickasaws' home villages.

On May 26, 1736, approximately 275 Frenchmen under the command of Bienville and 600 Choctaw allies under Chief Aliba-

mon Mingo attacked the heavily fortified and English-supported Chickasaw villages, including Ackia, which was controlled by Chief Red Shoe. The attack began at 2:00 p.m. French grenadiers moved in first, hoping to use a mantelet transported by African slaves to protect them as they advanced within range to deliver grenades. This action was to "soften up" the defenses before a main charge by Choctaw-French forces. However, the slaves fled early in the advance, leaving grenadiers exposed to heavy losses before they could take a few fortified houses on the periphery.

Red Shoe's Chickasaw defenders were well protected with a four-foot-deep trench, earthen ramparts, and triple stockaded houses. Soon, Chickasaws from the neighboring villages came to support Ackia. Worse still for the French, the English presence meant the Chickasaws would be amply supplied with gunpowder and firearms.

The French forward force of grenadiers was pinned down and officers were dying at an alarming rate. The French decided to retreat, sending 80 additional men forward to protect the retreat and retrieve the dead and wounded. Chief Mingo dispatched a charge of Choctaw warriors to accomplish the task. By 4:00 p.m. he had lost 22 men to the well-designed Chickasaw defenses.

When the battle ended, French and Choctaw casualties numbered more than 70 men, including most of the French officers. No casualty statistics are available for the Chickasaws, though it is believed that their losses were slight. The defeat weakened French power in North America and meant the virtual loss of secure communications between Louisiana and Canada.

Acoma Pueblo, Fight at

Start Date: January 22, 1599 End Date: January 25, 1599

Fierce battle at the Acoma Pueblo in New Mexico between Spanish forces and Acoma natives that resulted in the wholesale deaths of some 800 Acomas. Located on top of a mesa 357 feet above the desert floor west of the Rio Grande Valley, Acoma Pueblo (or Sky City) was home to approximately 6,000 Keresan-speaking Acomas at the end of the 16th century. Irrigated fields of corn and beans encircled the steep slopes of the mesa walls, and residents traveled between town and farmland by using a combination of stairs and

hand and toe holes carved into the red rock. Prior to the arrival of the Spanish, Acoma had been inhabited for at least 500 years, making it one of the oldest continuously occupied settlements in North America.

In the early 16th century, the viceroy of New Spain authorized expeditions north of Mexico in hopes of discovering riches rumored to be found among the adobe towns scattered across the landscape. Francisco Vásquez de Coronado, governor of the province of New Galicia in northern Mexico, led the largest of these expeditions from 1540 to 1542. Coronado's captain of artillery, Hernando de Alvarado, visited Acoma with a small force of men on his way back from a foray to Zuni Pueblo in 1540 and noted the pueblo's virtually impregnable position atop the mesa.

Coronado's accounts of his unprofitable expedition dissuaded further ventures into pueblo country for over half a century. In 1595, Juan de Oñate was charged by the Spanish court with leading an expedition up the Rio Grande Valley to spread the Catholic faith, pacify the natives, and establish a permanent colony in the northern provinces of New Spain. In 1598, after a series of delays, Oñate and 500 men, women, and children entered New Mexico near present-day El Paso, Texas. By late May, Oñate had reached the upper Rio Grande and encountered the first of many pueblos he formally claimed for Spain.

In July 1598, Oñate arrived at the confluence of the Chama and Rio Grande rivers and established his headquarters at Ohke Pueblo, which he renamed San Juan, the capital of the new colony.

From San Juan, Oñate dispersed friars to the pueblos, and he personally led a party of colonists and soldiers on a reconnaissance of the province. On October 27, 1598, Oñate arrived at Acoma, ascended the mesa, and entered the city. Residents of the pueblo disagreed on how best to deal with the Spanish. Ultimately, the natives decided to treat Oñate and his party hospitably and gave them (as well as their horses) food and water. Before leaving, the governor informed the inhabitants of Acoma that they were now under Spanish rule.

In December 1598, Oñate's nephew, Juan de Zaldivar, arrived at the base of Acoma Pueblo at the head of a column of 30 soldiers en route to a rendezvous with his uncle. Zaldivar demanded food for his hungry men. The Acomas refused to comply with his request. They did, however, agree to trade cornmeal for tools if the Spaniards could wait until they completed the grinding process. After waiting three days for the promised cornmeal, Zaldivar and 16 of his men ascended the mesa and entered the city. What happened next is not entirely clear. Native accounts blame the ensuing violence on the Spaniards' mistreatment of Acoma women and

their exploitation of the pueblo's hospitality. Spanish survivors claim that the Acomas attacked by design. Either way, Zaldivar and his men were quickly overwhelmed. Only 4 of the 16 men were able to flee to the desert floor and safety. Zaldivar was among the dead.

When Oñate received word that his nephew had been killed, the governor dispatched Juan's brother, Vicente de Zaldivar, along with a force of 70 men, on a mission to punish the pueblo. On January 22, 1599, Spanish soldiers arrived at Acoma and, under the cover of darkness, managed to scale the steep-sided mesa and haul a cannon to the top. Zaldivar besieged the city for three days. Cannon fire destroyed adobe walls and soldiers gored villagers fighting to save their homes and families. When the carnage ended, approximately 800 Acoma men, women, and children lay dead; another 580 were taken captive.

Oñate quickly orchestrated a trial, over which he presided, and found the Acomas guilty of treason against Spain. Adolescents were sentenced to 20 years of servitude, and adult men were to have one foot amputated. The mutilation was to be conducted in the plazas of pueblos along the Rio Grande as a lesson to those who might question Spanish authority. The inhabitants of Acoma eventually rebuilt their city, but the bitter memory of the events of January 1599 contributed to the Pueblo Revolt of 1680 and remained transfixed in their minds for centuries to come.

Adair, James

Born: ca. 1709 Died: ca. 1780

Trader to the Cherokees and Chickasaws and author of *The History of the American Indians* (1775), a seminal book about Native Americans in the Southeast. Little is known about Adair's early life, besides the fact that he was born in Antrim, Ireland, around 1709. His father was probably Sir Robert Adair, a member of the Scottish nobility.

Well educated and ambitious, James Adair arrived in South Carolina in 1735 and within a year had begun trading among the Cherokees. His first major involvement in native affairs came in 1745, when he convinced Gov. James Glen to involve himself in the Choctaw Civil War. Adair and Glen both sensed a diplomatic and commercial opportunity to win Choctaw allegiance and profit from the deerskin trade with the Choctaws.

Fearing French retribution for his diplomatic foray, Adair moved east and spent several years out of the public eye. In 1758,

he reemerged with advice for William Henry Lyttelton, South Carolina's new governor, about a possible land invasion of Mobile. Adair offered to lead Native American warriors into battle, but nothing came of the plan. During the Cherokee War (1759–1761), Adair did lead a Chickasaw war party against the Cherokees and returned to trade among the western Chickasaws following the war, where he finished the work on his *History*.

This book, published in 1775, was Adair's most important contribution to history and has since served as a major source of southeastern native ethnography. Adair died around 1780, location unknown.

Admiralty Law

Admiralty law is a body of law dealing with trade, injuries, and various disputes that arise from seafaring. The deputy or the lieutenant of the admiral presided over the High Court of the Admiralty in England. The latter is believed to have been established as a civil court by King Edward III in 1360, although the power of the lieutenant of the admiral to decide disciplinary cases in the fleet, as well as matters of piracy and prizes, originated even earlier. At first there were separate admirals or rear admirals of the north, south, and west to deal with cases, but by the 1440s these were merged into one court presided over by a lord high admiral.

In theory the lord high admiral had the power to resolve all maritime disputes, but in practice he divided his power among judges appointed to head local courts of vice admiralty in various ports. The first of these was in Jamaica in 1662. The procedural rules followed by the vice admiralty courts resembled those in courtsmartial rather than the common-law courts.

The first vice admiralty court established in mainland North America was in Maryland in 1694. By 1768, there were 10 vice admiralty courts in the English colonies. There were courts in Nova Scotia, Newfoundland, Massachusetts, Rhode Island, New York, Pennsylvania, Maryland, Virginia, North Carolina, South Carolina, and Georgia. In 1768, the vice admiralty courts were reorganized into four regional courts located at Halifax, Boston, Philadelphia, and Charles Town (present-day Charleston, South Carolina).

Admiralty law included case law and rulings concerning acts of Parliament. In 1696, Parliament passed the Act for Preventing Frauds and Regulating Abuses in the Plantation Trade, which gave jurisdiction to courts of admiralty in the colonies. In the 18th century, Parliament passed other legislation that changed the jurisdic-

tion of the vice admiralty courts. These included the Piracy Acts (1700, 1717), the Prize Act (1707), the Molasses Act (1733), the Sugar Act (1764), and the Stamp Act (1765).

The vice admiralty courts in America had two basic jurisdictional areas. Prize cases occurred frequently because of the frequent wars Great Britain fought with other European powers during the colonial period. Both British and colonial authorities issued numerous letters of marque to privateers, privately owned vessels that preyed on enemy shipping. The privateers captured a large number of enemy vessels, known as prizes. These vessels had to be brought into an English port, with their disposition decided by a vice admiralty court. Only then could the vessel be condemned and sold.

The other jurisdictional area comprised "cases of instance." These were cases in which a plaintiff brought suit in the "instance" of some claim involving injury aboard ship, failure to pay wages to a seaman, suits for salvage, or rulings on bottomry bonds (a kind of lien) on a ship.

Piracy was not generally a matter for vice admiralty courts. Felonies on the high seas or piracy were normally tried in commonlaw court, sometimes with the participation of a vice admiralty judge.

African Americans

African Americans had a long history of military service in North American colonial warfare, particularly in the Southeast and the Caribbean. They served as soldiers, sailors, fatigue men (erecting fortifications, improving breastworks, digging ditches, building bridges, etc.), pioneers (soldiers who prepared roads or terrain for the main body of troops), and musicians (drummers or fifers). Black participation in North American warfare often benefited both colonial governments and African Americans. Spanish, Dutch, British, and French colonies all used blacks (free, indentured, or slave) as a key source of manpower, and black participants frequently sought military service as a means of economic, social, political, and military advancement.

Throughout the colonial period, European imperial rivalries employed black men to clear land, plant crops, build fortifications, and to protect frontier boundaries of private landholdings and royal territories. The incorporation of African Americans and Native

Americans to fill the vacuum of manpower needs also had an economic benefit for colonial governments; non-Europeans were less expensive to house, equip, and feed. But as African Americans and Native Americans performed their labor-intensive roles to meet the defense requirements of extended colonial empires, they often faced poor living conditions, minimal pay, social and military exclusion, and prejudicial judgments of their skills and bravery. The military experience of black men, however, varied with each colonial government, and their treatment depended on the severity of the slave system in which they lived. Because of the variety of slave experiences, African Americans associated themselves with the government that could best address their self-interests and their demands for equality and inclusion.

Spanish Florida offered free blacks and runaway slaves one of the best opportunities for equality and inclusion in colonial America. By sheltering runaway slaves, Spanish governors were able to settle and protect territory threatened by colonial rivals and former slaves were able to find refuge in the Spanish colonies. Although runaway slaves could rebuild family ties, form new relationships, and earn rewards and social advancement for their militia service in Spanish America, colonial administrators still feared the autonomous African American. This was the case with Francisco Menéndez, runaway slave, veteran of the Yamasee War (1715-1717), and commander of a slave militia in Florida. Menéndez's loyal service, however, was not rewarded with freedom. Instead, he and nine other escaped slaves were reenslaved and sold at auction. But Menéndez and his militiamen persisted in their fight for freedom, arguing that their loyal service warranted liberty, not servitude. Their persistence eventually paid off; accompanied by his newly freed militiamen, Menéndez was appointed leader of the largest free black community of the era, Gracia Real de Santa Teresa de Mosé, located two miles north of St. Augustine. Unlike Spanish officials, French, Dutch, and English colonial authorities made no concerted effort to create an allfreemen or -slave militia except in the Caribbean during times of war and used African Americans on a more conservative basis.

The number of slaves and freemen in New France (except in Louisiana) was small in comparison to the number in Spanish America. New France required little skilled and gang labor because it was a colonial empire based on fur trade and mission colonies, with no economic base in which a slave system could produce profits. However, New France did attempt to answer their manpower needs by introducing large numbers of slaves between 1677 and 1704 to work fisheries, mines, and agricultural fields. But French officials could not obtain slaves immediately or profitably and never developed an intercolonial slave trade. After 20-odd years, New France abandoned the slavery system that could not be molded to fit to the economy of French North America. Only in Louisiana, where sugar plantations thrived, did slavery become firmly established.

War and rumors of war benefited slaves in the English colonies bordering New France. During King William's War (1689–1697), for example, French authorities appealed to the self-interests of slaves by offering them freedom if they left their English masters.

14 Aguayo Expedition

African Americans who sided with the French, however, discovered that they left behind an English slave system that offered some community inclusion for a French system that did not offer freedom, but rather domestic servitude.

In Dutch and English colonies, African Americans saw only intermittent service during times of colony necessity. Their semiexclusion was continually modified by colonial militia laws to restrict any black assertiveness that challenged the colonists' social structure. When the need arose to suppress Native American uprisings or to defend against European intrusions, African Americans were called to serve in the militia, which was a mixture of colonial mandate and community service. They were often compensated with noncommissioned officer promotions, pay, land, and freedom. A 1703 South Carolina act, for example, promised any slave who killed or maimed the colony's enemies his freedom, with the master of that newly freed slave to be compensated with public money to purchase a replacement. Their service, most often supervised by white officers, was usually mandatory and required all blacks between the ages of 15 and 60 to serve. Reluctant to empower blacks with weaponry, however, colonial and local authorities relegated African Americans to supportive roles. With the exception of slaves in frontier communities, African Americans were not allowed to carry arms or ammunition and were sent to work as pioneers, fatigue men, and musicians.

Similar to the militia laws in the northern colonies, southern militia statutes changed because of sociopolitical fears. The greatest concern for southern plantation owners was their large slave population. If African Americans were going to serve in the militia, the southern colonial governments had to ensure slave loyalty. When the need for African American service ended or when slave uprisings threatened, colonies disarmed blacks and prohibited them from serving in militias. For example, South Carolina, a colony that had incorporated slaves into its militia for more than 30 years, excluded all blacks from militia service after the Stono Rebellion in 1739. The causes for the rebellion are a matter of debate, but it is suggested that one of the reasons for the revolt was the many accounts of former slaves from Carolina obtaining their freedom by escaping to Spanish Florida. The 60 to 100 rebelling slaves seized a cache of weapons, burned plantations, and killed whites. Because of the Stono Rebellion, Carolinians put a 10-year hold on slave imports into Charles Town (present-day Charleston, South Carolina) and created slave codes that banned slaves from earning money or becoming educated.

After 1763, the spread of republican ideology in Britain's American colonies led African Americans to petition for their freedom and take part in antislavery movements. The British desired to use blacks as a source of manpower and appealed to the self-interests of the slaves, who had little to lose in material goods or property. Even though African Americans met all the requirements to be labeled as revolutionaries, proslavery sentiments limited black military participation in the American colonies before 1776. Further-

more, the Continental Army could not employ black soldiers as readily as local militias because it was comprised of men from 13 separate colonies with varying degrees of racial acceptance.

As the king's representative in Virginia, John Murray, Earl of Dunmore, took full advantage of the Anglo-American hesitancy. His November 1775 proclamation declared that all indentured servants and slaves would be freed from bondage if they enlisted into the ranks of the British Army. The proclamation did more than fill the ranks with laborers who desired escape from repression; it also played on colonists' fears of servile insurrection. Dunmore's desired effect was to create panic among rebellious planters and cause them to leave the revolutionary cause and return home to protect their families and property. The colonials reacted swiftly when word of Dunmore's proclamation reached them, and they immediately took countermeasures. Virginians quickly responded with their own declaration. Their declaration condemned Dunmore's proclamation as an attack on Virginia's society and threatened slaves who joined him.

Nevertheless, it was not loyalty to the Anglo-Americans or British that led African American soldiers to fight, but the promise of personal freedom, which British officials used to draw thousands of slaves who performed important support functions for the British Army.

Aguayo Expedition

Start Date: 1720 End Date: May 1722

Spanish effort to resettle Spanish colonial lands in East Texas, organized by Joseph de Alzor y Virto de Vera, Second Marqués de San Miguel de Aguayo, in response to French incursions from Louisiana in 1719. At the time, neither the Spanish nor the French had much of a presence in the region, which was controlled by Hainai and Caddo natives. Aguayo set out to change that, and the Spanish viceroy of New Spain commissioned him to do so with a

500-man force organized as the mounted infantry Battalion of San Miguel de Aragón. A staggering 4,000 horses and livestock provided transportation and provisions. Aguayo's strategy was to use overwhelming mounted force and negotiations to bring about Spanish reclamation of East Texas.

The French had already occupied Natchitoches and gained control of the Old San Antonio Road from Natchitoches to San Antonio and into Mexico. The road was a trade route for illegal goods into Mexico from French and English North America. The French also began to divert trade through newly established New Orleans. Aguayo sought to use his massive expedition to reestablish Spanish trade dominance and regain control of the region without engulfing Spain in a prolonged war that might threaten both.

From Mexico the expedition reached San Antonio on April 4, 1721. It then proceeded toward old Spanish settlements on the Trinity River. Natives and Frenchmen east of the river responded favorably, and French commander Louis Juchereau de St. Denis agreed to withdraw to Natchitoches. Eventually, France would abandon Natchitoches and further settlement attempts in the region, turning its attention to Louisiana. The Aguayo expedition reestablished six new missions, rebuilt the presidio of Nuestra Señora del Pilar de los Adaes to protect missions from hostile natives and prevent future French intrusion into East Texas.

After leaving some of his men in East Texas, Aguayo returned to San Antonio in the fall of 1721. While in San Antonio, he established a new mission, San Francisco Xavier de Náxara, and rebuilt the presidio of San Antonio de Béxar. He then moved to La Bahía, where he founded the Nuestra Señora de Loreto presidio and the Nuestra Señora del Espíritu Santo de Zúñiga mission. Aguayo ultimately returned to Coahuila in May 1722 after leaving behind 219 men who had participated in the expedition.

Aguayo's expedition permanently established the Spanish claim to Texas by increasing the number of Texas missions from 2 to 10, the number of Texas presidios from 1 to 4, and the number of soldiers stationed in Texas from 50 to 269. Never again would France seriously dispute the territory, partly because New Orleans was becoming a new, if somewhat independent, center for illicit trade and piracy in the Gulf of Mexico.

Aix-la-Chapelle, Treaty of Event Date: October 18, 1748

Agreement concluded on October 18, 1748, in Aix-la-Chapelle (Aachen, Germany) that marked the end of the War of Austrian Succession (1740–1748). Generally speaking, the principle of status quo ante bellum, or restitution of the situation before the war, shaped the terms of the treaty.

Under provisions of the Treaty of Aix-la-Chapelle, the House of Hanover retained the succession in both its German states and in Britain. The treaty also guaranteed the right of Habsburg archduchess Maria Theresa to Austrian territory in the Pragmatic Sanction. However, it weakened her position considerably because of its recognition of Prussia's conquest of the Austrian territory of Silesia. Conversely, Prussia's acquisition of this rich territory marked its arrival as a great power in Europe. The agreement also provided that Don Philip, the second son of King Philip V of Spain, be given Parma, Piacenza, and Gusastalla in Italy; his brother Charles retained Naples and Sicily.

Maria Theresa was determined to recover Silesia, and her subsequent success in forming a powerful coalition of states against Prussia led Frederick II of Prussia to mount a preemptive strike against Austria in 1756, beginning a new general European struggle known as the Third Silesian War or Seven Years' War (1756–1763).

The Treaty of Aix-la-Chapelle also failed to resolve the Anglo-French struggle for commercial supremacy in the West Indies, Africa, and India. The treaty provided for the return of the fortress at Louisbourg on Cape Breton Island in North America to France, and Madras in India was returned to Great Britain.

The return to France of Louisbourg was a particularly bitter pill for the British colonists in North America to swallow. This great fortress commanded the entrance to the St. Lawrence River, the lifeline of New France. Louisbourg also served as a base of operations for French privateers who harassed New England commercial interests. During King George's War (1744–1748), the North American phase of the War of Austrian Succession, in May and June 1745 a colonial force of 4,000 men led by William Shirley, governor of Massachusetts, and William Pepperrell, a wealthy merchant from Maine, conducted a successful siege of Louisbourg. Two subsequent French attempts to recapture the stronghold ended in failure.

The restoration of Louisbourg to France without consultation with the colonists produced a wave of indignation throughout British North America. Consequently, the British government agreed to bear the cost of the Louisbourg expedition, but this failed to allay colonial concerns over the designs of the leaders of the British Empire. In turn, that discontent fostered a belief among the colonists that they must take control of their own affairs in order to defend their interests. Indeed, the seeds of discontent that would in 1775 erupt in rebellion were sown in the 1740s.

The Treaty of Aix-la-Chapelle thus merely served as a truce in the long-running Anglo-French contest for control of North America. That rivalry would finally be decided in favor of Great Britain as a consequence of the French and Indian War (1754–1763).

Alamance, Battle of Event Date: May 16, 1771

Battle fought on May 16, 1771, in Guilford County, North Carolina, between 1,500 militiamen under the command of Royal Governor William Tryon and 2,000 to 3,000 so-called Regulators, who were protesting farmers from the backcountry counties. The Battle of Alamance was the largest violent confrontation between opposing forces of Anglo-Americans in the entire colonial period.

Between 1768 and early 1771, backcountry farmers in North Carolina had accused several county and colonial-level officials of corruption. In the summer of 1768, Governor Tryon confronted approximately 3,700 Regulators who had gathered in the town of Hillsborough to observe and protest the trials of several of their leaders. With this show of force, Tryon was able to convince the Regulators to return to their homes. In late 1770 and early 1771, however, backcountry protests once again flared and Tryon began planning an assault on the Regulators in the spring.

Tryon mustered militia companies from several counties in March 1771 and began marching west toward the Regulator strongholds. At the same time, General Hugh Waddell, a general charged with raising loyal militia forces in the western counties, marched toward the east. While a large force of Regulators blocked Waddell's advance, Tryon's force camped on Great Alamance Creek, near present-day Burlington, North Carolina.

On May 16, 1771, a force of poorly armed Regulators numbering between 2,000 and 3,000 men approached the militia encampment and demanded to entreat the governor. Tryon agreed to none of the Regulators' demands but offered all except their leaders amnesty if they swore an oath of allegiance and returned to their farms. After the last parley, Tryon held hostage one of the Regulator negotiators and later ordered his execution within view of the main body of Regulators. The battle commenced shortly afterward.

In the early minutes of the battle, the Regulators held their own against the militia. Both sides were relatively disorganized, and it is

clear that many of the Regulators had not anticipated a real battle. In fact, several of the principal Regulator leaders had departed from the main force before the fight had begun. Without a clear rank structure or any sort of commanding authority, the Regulators failed to mount any real threat to the governor's force. Once the militia began firing its artillery piece, the Regulators were soon dispersed. Each side lost 9 men. Sixty-one militiamen were wounded, and an unknown number of Regulators were injured in the fight. In the days after the battle, 12 Regulators were convicted of treason and 6 of them were hanged. Although several Regulator leaders remained at large, the insurrection was effectively ended.

Albany Conference

Start Date: June 19, 1754 End Date: July 11, 1754

The Albany Conference, also known as the Albany Congress, met from June 19 to July 11, 1754, to repair deteriorating relations between the government of New York and the Iroquois Confederacy. In 1753, Mohawk leader and spokesman Chief Hendrick (Theyanoguin) had informed then-governor George Clinton that "the Covenant Chain is broken between you and us" and that New York's proximity to New France necessitated good relations to protect the fur trade and frontier defenses. The French had already begun reasserting old claims to the territory from the Great Lakes down the Ohio and Mississippi rivers and asserting new claims to the Wyoming Valley. Their claims were emphasized by the construction of Fort Duquesne at the Forks of the Ohio. The Board of Trade ordered the northern colonies to convene at Albany in order to renegotiate Indian alliances and trade agreements and assess the status of frontier defenses. As the delegates arrived, George Washington's debacle at Jumonville's Glen in May and his besiegement at Fort Necessity should have added a note of dire urgency to the proceedings.

On the contrary, however, the Albany Conference became a tangle of political intrigue interlaced with the backroom maneuvering of land speculators, primarily from New York, Connecticut, and Pennsylvania. They all coveted Wyoming Valley territory and other Iroquois lands and sent agents to negotiate purchases of lands occupied by the Delawares and Susquehannocks, who generally were not privy to the proceedings. Spurious land claims conflicted

with fraudulent deals brokered by unscrupulous Indian representatives and white middlemen, and these exacerbated preexisting rivalries centered on territorial claims and acquisitions. New York, which saw itself as the primary theater in any future colonial war with France, demanded that Virginia, Pennsylvania, and New England assist in financing the construction of a string of defensive forts in Iroquoia, demands that were summarily rejected. New England was particularly loath to do anything for the benefit of New York, as Massachusetts intermittently clashed with New York over joint claims to the land in present-day Vermont. Further, it saw no sense in committing precious funds to an endeavor that would not protect New England, which was also concerned about New France's proximity.

The political and economic ambitions of the presiding officer, New York's Gov. James Delancey, who was also New York City's most powerful merchant, were also on display at the conference. The assembly provided Delancey a platform from which to advance his mercantile interests in the Iroquois fur trading network as well as the political and financial aspirations of William Johnson, an influential Mohawk Valley trader. Together they cultivated the patronage of Thomas Pownall, a younger brother to the secretary of the Board of Trade, who sent to the Earl of Halifax reports of the conference that emphasized the positive contributions of Delancey and Johnson. Benjamin Franklin, a Pennsylvania delegate, likewise networked with Pownall to advance an idea he had for an intercolonial union. However, like the local politico-mercantile intrigue that infected the conference, larger scale political rivalries involving the American and British clients of aristocratic patrons in England precluded substantial progress toward viable colonial defense.

Franklin's Albany Plan of Union, for which the Albany Conference is best known, and which Pownall enthusiastically supported, involved an ambitious redefinition of the colonies' status within the British Empire. Cognizant of the uneven British administration of colonial affairs in America and the dangers of American disunion, Franklin proposed to solve these problems with the creation of a grand council composed of elected delegates from each colony. The council would administer affairs directly involving military defense, Indian affairs, intercolonial relations, and western land policies, as well as have the power to tax the colonies for mutual defense. It would be overseen by a royally appointed president general who would report to the secretary for the Southern Department and thus streamline imperial administration. Despite some initial interest in the plan, it was soundly rejected by the delegates, who knew that their respective assemblies would not share authority with another body, and by Whitehall, which did not wish to relinquish its growing direct control over the American colonies. Although the Albany Conference was a failure in terms of grand designs, it turned out to be lucrative for a number of men, especially William Johnson, who was appointed superintendent for northern Indian affairs in 1756 and eventually received a knighthood for his work during the French and Indian War.

Algonquins

Native American people who occupied the Ottawa River Valley, the border between the present-day Canadian provinces of Ontario and Quebec. Either Algonquin or Algonkin are acceptable spellings of the tribal name, although in their own language the Algonquins call themselves "Anishnabe" or "Anishnabe," meaning "original person" (the plural is "Anishnabek" or "Anishnabeg"). The word "Algonquian" (Algonkian) refers to a group of languages that include those of not only the Algonquins but also the Cheyennes, Arapahoes, Crees, Blackfeet, and Ojibwas, among others.

A 1645 portrait of an Algonquin Native American with facial markings and wearing a necklace and head ornaments. (Library of Congress)

Algonquian is, in fact, the largest North American native language group. The Iroquois, however, referred to the Algonquins as "the Adirondack" (literally, "they eat trees").

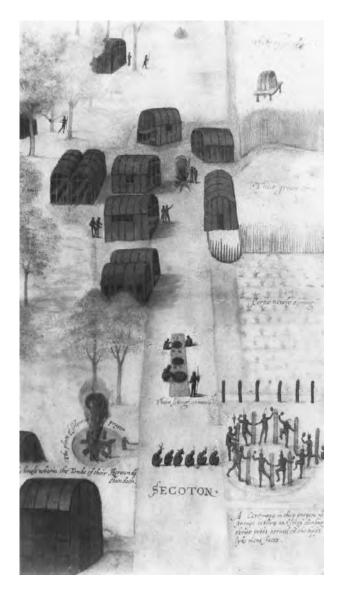

In 1603, when they first encountered the French, the Algonquins probably numbered some 6,000 people. In 1768, the British estimated their population at 1,500 people. The Algonquins were a seminomadic people, being too far north for settled agriculture. In contrast to the neighboring Iroquois to the west and the south, who lived primarily by agriculture in large fortified communities, the Algonquins were hunter-gatherers and trappers who lived in villages. Their shelters were of birchbark, known as waginogans or wigwams, and Algonquins traveled by water in birchbark canoes. In winter the villages split into smaller extended family units for hunting. The harsh winter conditions would not allow additional burdens, and the Algonquins were in consequence often known to kill the sick or badly injured among them. Algonquins were patrilineal, with hunting rights passed down from father to son. The Algonquins were known as fierce warriors, and they dominated the Iroquois until those tribes came together in the Iroquois Confederation.

When Jacques Cartier first arrived in the St. Lawrence River in 1534, he found only Iroquois-speaking people living in the area between Stadacona (Quebec) and Hochelaga (Montreal), but following near-continual warfare between the Iroquois and the Algonquins from 1570 and the resultant formation of the Iroquois Confederation, the Iroquois drove the Algonquins north from the Adirondack Mountains and upper Hudson River Valley. The Alqonguins in turn displaced or absorbed Iroquois-speaking native peoples along the St. Lawrence.

In 1603, Samuel de Champlain made contact with the Algonquins when he established a French trading post along the St. Lawrence at Tadoussac. He soon learned that the Hurons rather than the Algonquins dominated the upper St. Lawrence. Anxious to secure both free passage and furs, in 1609 Champlain joined the French to the struggle among the natives of the region by committing himself to aiding the Algonquins, Montagnais, and Hurons in an expedition against the Mohawks of the Iroquois Confederation. Although by the time of the battle, the French contingent numbered only Champlain and two others, their firearms proved the difference and the Mohawks fled.

This victory brought a formal alliance between the French and Algonquins and trade in furs in exchange for the European tools and weapons sought by the Native Americans. By 1610 the Algonquins, led by their chief, Piskaret, dominated the St. Lawrence Valley. In the process, however, the French had made an implacable enemy of the Mohawks. In 1614, Champlain participated in an Algonquin-Huron attack on the Oneida and Onondaga natives, cementing the Iroquois enmity toward the French. Soon the French were doing most of their fur trading with the Hurons rather than the Algonquins, much to the displeasure of the latter.

Intermittent fighting continued between the Mohawks and the Algonquins and Montagnais. In 1629, the Mohawks attacked the Algonquins and Montagnais near Quebec in what is usually consid-

Drawing of an Algonquin village by John White, ca. 1585. His paintings of the Indians of the North Carolina coast are among the earliest to be created by a first-hand witness to the lives of the native peoples. (Library of Congress)

ered the beginning of the so-called Beaver Wars, which lasted until 1700. This fighting was prompted by the desire of the Iroquois to expand northward. During 1629–1632, taking advantage of the temporary defeat of the French by the English, the Mohawks drove the Algonquins and Montagnais from the upper St. Lawrence Valley. Peace terms allowed the French to return to Quebec in 1632, when they sought to restore their allies by furnishing firearms to a number of them. This effort proved unsuccessful, especially as the Dutch in turn provided the Mohawks with large quantities of the latest firearms. By the end of the 1640s, the Mohawks and Oneidas had driven the remaining Algonquins and Montagnais from the upper St. Lawrence and lower Ottawa River areas. The Iroquois had also defeated the Hurons.

The arrival of a contingent of regular French troops in 1664 allowed the Quebec government to conclude a lasting peace with the Iroquois three years later. The French then resumed trading

with the western Great Lakes region. The peace also permitted the Algonquins, now greatly reduced in number, to begin returning to the Ottawa Valley.

Although only some Algonquins converted to Catholicism, the nation as a whole was bound to the French cause during the French and Indian War (1754–1763). In August 1760, after British forces had taken Quebec, the Algonquins and other French Native American allies made peace with the English, agreeing to remain neutral in any future fighting between the English and French. This agreement sealed the fate of New France.

The Algonquins continued their new loyalty to the British, fighting on their side during the American Revolutionary War (1775–1783) and taking part in Lieutenant Colonel Barry St. Leger's campaign against Patriot forces in the Mohawk Valley in 1777. Following the war, when many British Loyalists fled to Canada, the British government settled a number of them on lands in the lower Ottawa Valley purchased from the Algonquins. Despite this, the Algonquins also fought on the British side in the War of 1812, helping to defeat U.S. troops in the Battle of Chateauguay in October 1813. The Algonquin reward for their loyalty was to be continually pushed off their ancestral lands. Ultimately, purchases by the Canadian government resulted in the establishment of reserves (reservations) for the Algonquins in their former homeland. Today the majority of remaining Algonquins live on nine reserves in the province of Quebec and one in Ontario.

Amherst, Jeffery

Born: January 29, 1717 Died: August 3, 1797

British Army officer and commander in chief of British forces in America (1758–1763) and commander in chief in Britain (1778–

Lieutenant General Jeffery Amherst, British commander in North America during 1758–1763. (Library of Congress)

1782, 1793–1797). Jeffery Amherst was born on January 29, 1717, on his family's estate of Brooks Place, in Riverhead, Kent, England. Amherst's military career began in 1731, when his influential neighbor and patron, Lionel Cranfield Sackville, Duke of Dorset, used his influence with Sir John Ligonier to help Amherst obtain a commission in the 1st Foot Guards. Amherst first saw active service during the War of the Austrian Succession (1740–1748) as an aide-de-camp to Ligonier. He secured the rank of lieutenant colonel by 1745. During the early part of the Seven Years' War (1756–1763), Amherst served on the staff of William Augustus, Duke of Cumberland, second surviving son of King George II.

Amherst's career accelerated in 1758, when Prime Minister William Pitt appointed him to command a joint Anglo-American expedition to capture the French fortress of Louisbourg on Cape Breton Island in North America, with the temporary rank of major general in America. British and American forces landed on June 8, 1758, and forced the garrison's surrender on July 26. The British owed their success as much to naval superiority as to Amherst's abilities, though he managed effectively both the siege and his sometimes impetuous subordinate James Wolfe.

In September 1758, Pitt appointed Amherst to overall command in North America. Amherst marched from Albany and occupied Fort Ticonderoga and Crown Point before poor weather ended the campaign. In the opinion of some, Amherst moved too sluggishly, but he recognized the importance of pacing his own advance with that of Wolfe down the St. Lawrence River. Wolfe prevailed at Quebec, and the following year Amherst commanded a successful offensive against Montreal, forcing the surrender of New France on

September 8, 1760. Rarely before had any commander coordinated the convergence of three forces from such widely distant starting points. Amherst received honors for his accomplishment, including promotion to lieutenant general in January 1761.

Although Amherst disliked American provincial troops, he maintained the all-important working relationship with American colonial officials. Americans later named several towns for him, including Amherst, Massachusetts, the home of the University of Massachusetts and Amherst College.

France's surrender altered the balance of power to the disadvantage of many northern Native Americans. This situation called for skillful diplomacy, but Amherst was lacking in this area. He sought to halt the British practice of providing "gifts" to the Native Americans, which the latter regarded not as simple grants but the reasonable cost of purchasing their political partnership. British officers experienced in Indian politics warned Amherst that his policy change would bring war. Even though Amherst's intransigence brought about the ensuing conflict, known as Pontiac's Rebellion (1763), he acted forcefully to quell the rebellion. During the conflict, the British employed biological weapons, namely, blankets allegedly laced with smallpox. While Amherst approved of their use, several subordinates likely introduced biological agents on their own initiative. Amherst was recalled and left for Britain on November 10, 1763.

While Amherst never received the public accolades he hoped for on his return, he received several promotions and offices, was made a peer, and sat in the House of Lords. He was offered command of British forces in America in 1774 and 1777 but declined both times. In 1778, he was promoted to general, became commander in chief in Britain, and organized the defense of Britain against the planned Franco-Spanish invasion of 1779. In 1780, he commanded the forces that suppressed the Gordon Riots. He was recalled as commander in chief in 1795 and promoted to field marshal that year. Amherst died on August 3, 1797, at Riverhead, Kent. While he never enjoyed consistent success, Amherst was nevertheless one of the foremost British soldiers of the 18th century and contributed significantly to the development of early America.

Amherst's Decree

Event Date: 1761

Decree issued in August 1761 by the British Army commander in chief in North America, Major General Sir Jeffery Amherst, that strictly regulated trade and exchanges with Native Americans in the North American colonies. A direct cause of Pontiac's Rebellion (1763), Amherst's Decree marked a dramatic shift in Britain's policies toward Native Americans as the French and Indian War drew to a close.

With France's power diminishing in North America in the late 1750s, its traditional Native American allies sought new arrangements with the British. Amherst sought to regulate Anglo-Native American relations by enacting a series of rules for such relations in the late summer and fall of 1761. In August of that year, simultaneously issuing a proclamation to all colonial governors and sending instructions to Indian Superintendent Sir William Johnson, Amherst announced a four-part policy change, mandating that (1) traders were prohibited from journeying to native villages to conduct business, compelling the native peoples to transport their trade goods to British forts; (2) British officials would no longer bestow on tribes large gifts, which had become substantial components of the Native American economy; (3) Native Americans were to be denied access to alcohol; and (4) only very limited amounts of ammunition or gunpowder could be transferred to native peoples. By these means, Amherst hoped not only to control Anglo-American contact with Native Americans but also to transform them into the British conception of sober, hardworking people.

Johnson vociferously protested Amherst's Decree. He argued that such measures would disastrously disrupt native societies and give them a common grievance that might unite them against the British. Amherst turned a deaf ear to his arguments, however, and the policies remained in place.

Ammunition, Small Arms

Individual firearms projecting lead projectiles by means of the rapid burning of black powder probably were the single greatest factor in the European conquest of North America. On the arrival of Europeans in the New World in the late 15th and early 16th centuries, this weapon was hardly more effective—often less so—than the bow, which could fire arrows at the rate of a dozen per minute, or the crossbow, which fired its bolts or quarrels at the rate of several per minute. The European matchlock firearm was heavy, slow to load, and plagued by misfires. However, the black powder used to project a lead ball from the firearm initially had a tremendous psychological advantage over Native Americans, thanks to the drama of ignition.

When the Europeans first arrived in North America, they brought with them matchlock firearms. The French version was typical; it fired a .66-caliber bullet from its .72-caliber bore. The followon flintlock used the same lead projectile, but these weapons varied widely in caliber, especially among the militia, from .50 to .80.

An individual using a firearm had to contend with many problems. He had to have a cleaning needle ready to free a clogged touchhole. The lead ball had to be the right size to fit the barrel of the weapon. Repeated firing with black powder produced a considerable residue in the bore (fouling), which presented difficulties to forcing the lead ball down the bore, even with a metal ramrod. For that reason, the difference between the diameter of the ball and the diameter of the bore (windage) was often considerable. In the early matchlock, the powder charge was ignited by the use of a slow match. In rain or snow, the burning match might be extinguished, rendering the firearm useless.

With the slow match and resulting smoke, surprise attacks were difficult if not impossible. Flintlocks, which came into widespread use at the end of the 17th century (the first British military flintlock was introduced in 1682), improved the reliability to the firing process, but misfires were nonetheless common. Despite their shortcomings, firearms gave the Europeans tremendous psychological superiority over their native enemies until both possessed that weapon and its ammunition.

The universal projectile for the matchlock and flintlock was a round ball cast of lead. Its shape was suited to unstabilized flight. As firearms came in a bewildering array of different calibers, especially for militia (who supplied their own weapons), their owners usually cast their own shot. Bullet molds were of iron, brass, steatite, or soapstone.

In the early colonial period, it generally required 1 ounce of black powder to fire a lead ball weighing 1.25 ounces. Gunpowder varied widely in its quality and composition. During the colonial period, it was produced in limestone caves in Virginia, Georgia, Tennessee, and Kentucky, where saltpeter (potassium nitrate) was found. The second ingredient, sulfur, was imported from volcanic regions. Charcoal was produced locally from willow and poplar. The usual gunpowder formula used by the English was 75 percent saltpeter, 15 percent charcoal, and 10 percent sulfur. French manufacturers used 75 percent saltpeter mixed with equal amounts (12.5 percent) of charcoal and sulfur.

These three ingredients were ground and mixed in a mortar fashioned out of an old log or some other hard wood. The pestle was usually of bronze. The charcoal was moistened with water and then pulverized saltpeter; sulfur was then added to the mix. At the end of this mixing process, which lasted several hours, a cake was produced and dried for future use. Rather than go through this laborious process, however, some black powder manufacturers used a "rolling barrel" method to mix the three ingredients before making a cake destined for the same drying process. During the colonial period, very little black powder was manufactured in America, and little attention was paid to scientific standards. Unsatisfactory American-produced gunpowder remained a problem into the American Revolutionary War.

Black power was stored in 6.25-pound wooden kegs provided by the powder factories. When in the field, the powder was stored in metal flasks or horns from oxen. For regular army units, the powder might be made up in cartridges that contained the bullet and sufficient powder to fire it. The paper wrapper was torn open on loading.

Gun flints became the method of ignition for firearms, but obtaining good gun flint was never easy. The best flints came from Brandon quarries, near London. They were sold in tubs or sacks of 5,000 to 20,000. When exported, the quantities were cut and ranged from 2,000 to 5,000 flints.

Though trade in arms and ammunition was universally outlawed in the early settlements, the Dutch led the way in providing the natives with arms and ammunition. A high-grade beaver pelt might purchase 8 pounds of black powder. The same beaver pelt bought 40 pounds of lead for bullets. During this period, the French demanded four beaver pelts for 8 pounds of black powder or three beaver pelts for 40 pounds of lead.

It was impossible for the colonial authorities to end the trade in guns and ammunition. The Native Americans soon recognized the value of firearms and were anxious to trade for them. Traders were eager to oblige, no matter what laws had been passed to stop such traffic. In 1640, the English Crown passed a law forbidding ammunition and arms trade with Native Americans. The law was ignored, and English traders subsequently armed the Cherokee and Catawba tribes. Farther north, the Iroquois Confederacy enjoyed the best ammunition that the trade could supply. Nevertheless, uniformity of supplies was unknown.

Ancient and Honorable Artillery Company of Massachusetts

Elite Massachusetts Militia unit chartered in 1638 and still in existence today. The Ancient and Honorable Artillery Company of Massachusetts became an important foundation of what would later become the tradition of the American citizen-soldier. The company's purpose has changed over time from training young gentlemen officers for militia duty to patriotic and historic preservation with special emphasis on supporting the military.

English colonists brought the militia tradition with them to New England and formed several such organizations in the New World. In 1637, former members of the Honorable Artillery Company of London organized to provide military training and discipline in Boston. The company gained its charter from Gov. John Winthrop of Massachusetts and the General Court in 1638, despite their initial resistance to such a venture. The colony's Puritan elite distrusted the merchants, who made up much of the company's membership, because the merchants engaged in transatlantic and Native American trade, exposing them to outside ideas and tendencies toward religious toleration.

The colony's leadership nevertheless concluded that the private company would be helpful to defense, despite the dangers collecting such men under arms might present to the establishment. Company men such as John Underhill led nearly all of the militias in New England's subsequent colonial wars and served prominently in the American Revolutionary War. Since then, company members have served in all of the wars of the United States. The company served as an elite social club as well as a military organization, a function that assisted in its transition from an active military unit to a historical and military-supporting organization. Company members have included four presidents and eight holders of the Medal of Honor.

Andros, Edmund

Born: December 6, 1637 Died: February 19, 1714

British soldier and royal governor of New York (1674–1681), the Dominion of New England (1686–1689), and Virginia (1692–1698).

Sir Edmund Andros, English soldier and royal governor of New York (1674–1681), the Dominion of New England (1686–1689), and Virginia (1692–1698). (Library of Congress)

Edmund Andros was born in London on December 6, 1637. His first experience with war came when he was a boy and his father's connections to King Charles I forced the family to flee the city during the English Civil War. Andros's military career began as an ensign in the Dutch army while he was still in exile from England. However, the restoration of the monarchy in 1660 brought him into the service of the burgeoning royal army, and for his dedication to the Stuart Crown, James, Duke of York, appointed him governor of New York in March 1674. Andros was among the most powerful and controversial of England's colonial administrators and military commanders.

Andros's diplomatic skills not only enabled New York largely to avoid the devastation of King Philip's (Metacom) War (1675–1676) but also led to the creation of the famed Covenant Chain, a 1677 treaty that secured decades of peace between the English and the Iroquois. Yet Andros was also willing to use force to protect and expand English interests in North America. Those critical of Andros's authoritarian style and his ties to the troubled Stuart monarchy repeatedly ousted him from office, only to find him reappointed to positions elsewhere in the colonies and even knighted for his services to the Crown.

Recently seized from the Dutch, New York held many challenges for Andros. When Andros arrived in New York following his appointment in 1674, he immediately set to work improving the colony's defenses while winning over influential Dutch merchants and Iroquois leaders. His relations with neighboring Connecticut proved more contentious, especially after the outbreak of King Philip's War

in 1675. Officials there condemned the governor's policy of offering asylum to Native Americans and accused New Yorkers of arming Metacom's forces. Although Andros's request for an Iroquois attack on Metacom helped turn the tide of war and saved New England from further ruin, its Puritan leaders were dismayed by the Crown's later decision to have the devoutly Anglican Andros govern them.

Andros was removed as governor of New York in 1681 following accusations that he had mismanaged royal revenues. Yet he still retained the duke's favor. After James became king in 1685, he chose Andros to administer the newly created Dominion of New England in 1686, which effectively stripped New Englanders of self-governance. Again Andros was quick to strengthen the dominion's defenses by rebuilding decaying forts, reorganizing the militia, and beefing up frontier forces.

In 1688, Andros personally led troops against Abenaki warriors who had begun attacking settlements in Maine. While there he learned of the "Glorious Revolution" against James II, which Andros's political opponents used to force his resignation in April 1689. Bereft of the governor's military and diplomatic skills, New England would suffer badly during the war with France that followed.

For his part, Andros won the patronage of the new sovereigns, William and Mary, who appointed him governor of Virginia in February 1692, a position he retained until his retirement in May 1698. Learning from his New England experience, Andros showed considerable flexibility in handling a variety of complex issues. Nonetheless, a feud with commissary James Blair led Andros, who was by then both elderly and ill, to retire. Returning to England, Andros served briefly as governor of Guernsey. He died in London, on February 19, 1714.

Anglo-Dutch War, First

Start Date: May 1652 End Date: April 1654

The first of three 17th-century wars between the English and Dutch. As with its sequels, the First Anglo-Dutch War was a naval conflict with its roots firmly planted in the heated commercial maritime competition between the two rival nations. By 1650, the Dutch presence in the waters around England and in the vicinity of the English colonies had become a concern to English commercial

interests. Because of their vast merchant fleet, the largest in Europe, the Dutch were the leaders of the European carrying trade. Indeed, much of what was imported into England came to port in Dutch ships. In the North Sea, Dutch fishing fleets were beginning to outnumber and crowd out those of England. Meanwhile, the Dutch colony of New Amsterdam, at the mouth of the Hudson River, was a constant threat to London's edict that its North American colonies trade only with the mother country.

England's maritime power in the middle of the 17th century was much less developed than that of the Dutch, but that was beginning to change. In the wake of the English Civil War (1642–1649), Parliament began to play a greater role in the governing of England. Because much of Parliament represented the burgeoning merchant class, government policy became more responsive to commercial interests. As such, the maritime dominance of the Dutch began to draw more concern and resentment. Also contributing to the growing animosity was the fact that Dutch ships often carried French goods and France had openly sided with the Royalist cause during the Civil War. To answer this, Parliament began expanding the English Navy with ships specifically built for battle. By the end of the Civil War, England possessed the largest number of purpose-built warships of any European nation.

In the wake of the war, Parliament turned more directly to the problem of the Dutch. Thus, in August 1651 it passed the first Navigation Act. This legislation decreed that goods coming into England had to be carried in English ships (or at least the ships of whatever country from which the goods in question came), fish sold in England had to be from English fishing fleets, Parliament had the authority to tax the North Sea fishing areas, and that foreign commercial ships were excluded from the English coastal trade. Moreover, England claimed ultimate sovereignty over the Channel waters and that English ships had the authority to stop and search any ship, and to demand a formal salute from foreign ships passing through these waters. The Dutch, realizing the threat to their economy created by this act and the likelihood that the policies regarding the Channel would inevitably result in conflict, began taking steps to protect their shipping.

In 1650, there was no clear agreement on either the most effective type of ship for battle or on naval tactics. These questions would be settled by the long experience of the three Anglo-Dutch Wars.

As far as battle fleets were concerned, the Dutch Navy stood in sharp contrast to that of England. The bulk of the Dutch fleet consisted of hundreds of armed merchant ships. The few purpose-built Dutch warships tended to be lightly armed. The *Brederode*, by far the largest warship in the Dutch fleet, could carry as many as 60 guns, but it was the exception. The Dutch naval policy reflected the traditional ideas of combat at sea. The most famous Dutch admiral, Maarten Tromp, was devoted to the time-tested tactics of grappling and boarding opposing ships, for which expensive purpose-built battle ships were less necessary.

In contrast, the English fighting fleet emerging under Parliament's design boasted almost 20 ships mounting more than 40

cannon each. Furthermore, and just as important, the English ships carried far heavier cannon than those of the Dutch ships. The largest English warship, the *Sovereign of the Seas*, mounted 100 guns. Alongside these were numerous other warships, including many of the new class of frigates, which usually mounted between 32 and 38 guns. These ships were designed not for a grappling and boarding melee at sea but for stand-off battle with cannon fire.

In 1651, the English began seizing hundreds of Dutch ships in the English Channel, making a clash all but inevitable. In May the next year came the first real fight between English and Dutch fleets. When the English, led by General at Sea Robert Blake, demanded a salute from Tromp's fleet, the latter refused and Blake opened fire. Tromp lost two ships before retiring. Immediately after, war was formally declared. Most of the fighting over the next three years involved one battle fleet trying to attack merchant convoys or fishing fleets while its opposite number tried to escort such unarmed ships. On September 28, 1652, in the Battle of Kentish Knock, the English under Blake battered a Dutch fleet, in the wake of which several Dutch commanders were imprisoned for cowardice. Two months later, however, on November 30, in the most heavily contested fleet action of the war, Tromp bested Blake and the English fleet off the southeast coast of England near Dungeness. The defeat came as a shock to the English. It was then compounded by the unacceptable results of a lengthy engagement during February 18-20, 1653, off Portland in which the Dutch lost 12 warships and more than 40 merchant ships. The English lost only 1 or 2 ships; 3 others were disabled. The Battle of Portland was, in fact, a turning point in the war, for the Channel was now effectively closed to Dutch shipping. Yet in spite of the heavy losses, Tromp was able to escort the bulk of an important convoy through the Channel to the Netherlands.

In the wake of these engagements, the English reviewed their tactics, leading to the issuance of the first Fighting Instructions in March 1653. These called for line-ahead formations to make maximum use of the heavier broadside guns. More than any other single innovation, this tactic brought an end to grappling and boarding. It grew naturally out of the heavy armaments of the English ships. Given that most of the English commanders were former land generals (hence the rank of "general at sea") who had been shifted over to naval warfare, and that linear tactics were firmly established as the way to fight on land, this highly disciplined "lineahead" formation was not that surprising. It did, however, prove to be extremely effective, especially with large, slow, and heavily armed warships. Soon, such ships, capable of standing in the main battle line, would be known as ships of the line or line-of-battle ships. The term survived into the 21st century.

By July 1653, the English fleet was blockading the Dutch coast, determined to use economic pressure to force an end to the war. Just as determined to break the blockade, Tromp sailed out in August with more than 100 ships. In the Battle of Scheveningen off the Dutch coast on July 29–31, the English purposefully set out to maintain the line-ahead formation once the fleets came into close contact even though the Dutch kept up their melee tactics and the

use of fire ships. Tromp was killed early in the action and the Dutch lost several warships that the increasingly strapped government could not soon replace. Even though the English fleet was too damaged to sustain the blockade and was forced back to port, the Dutch began to see the conflict as hopeless. Scheveningen proved that for the time being, at least, the English heavy-gun battle fleet would be able to control the North Sea.

Scheveningen was also the last major battle of the war. Oliver Cromwell, who gained control of the English government and declared himself "Lord Protector" of the Commonwealth in late 1653, had little desire to continue a bitter and costly struggle with another Protestant nation. At his insistence, the Treaty of Westminster was signed in April 1654, bringing the first Anglo-Dutch War to a conclusion.

The end of the war, however, was anything but conclusive. On the one hand, England's Navigation Acts remained in place. On the other hand, however, so too did the Dutch carrying trade, despite the fact that the Dutch had lost around 1,500 merchant ships during the conflict. England dropped its most ambitious claims regarding its right to tax fishing in the North Sea, but little of substance was resolved. Ultimately, neither nation achieved the real goals for which it had been fighting.

During the war, fighting almost occurred between the Dutch colony of New Amsterdam at the mouth of the Hudson River and the surrounding English colonies. In April 1653 delegates from the New England colonies met with Dutch director general Petrus Stuyvesant at New Amsterdam and accused the Dutch of stirring up the natives to attack the English in Connecticut. Although Stuyvesant denied the charges, the English colonies threatened war before departing. Stuyvesant took these threats seriously and caused the northern defenses of the colony to be strengthened from the East River to the Hudson.

The New England governments were not able to agree on a common policy toward the Dutch, however. As it worked out, the most damaging part of the war for New Amsterdam was the cutting off of trade with the Netherlands. In 1654, England did send a squadron of four ships to New England with the intention to employ them in a descent on New Amsterdam. Peace was declared before that expedition could be mounted, however.

Peace did not last long, for the first Anglo-Dutch War proved to be merely one act in a longer struggle. Indeed, the English seized Jamaica in 1655. Fighting resumed a decade later with the issue no less than which power would control the sea.

Anglo-Dutch War, Second

Start Date: January 1664 End Date: July 21, 1667

Armed conflict between the Dutch Republic and England, primarily waged at sea. The Second Anglo-Dutch War had its beginnings in the compromise ending the First Anglo-Dutch War of 1652–1654. The April 1654 Treaty of Westminster, which ended the fighting, had left largely untouched the serious issues growing out of the economic competition between the two nations. In retrospect, the treaty could be more accurately described as a cease-fire rather than as a substantive settlement. To no great surprise, neither state was willing to lay aside practices it regarded as central to its national interest. Because these national interests were seen as mutually incompatible, it was only a matter of time before hostilities flared up again.

In the wake of the restoration of the English monarchy and the ascension of King Charles II to the throne in 1660, trade remained the central point of irritation between England and the Dutch Republic. The ongoing development of the economic concept known as "mercantilism" ensured that the two countries would remain bitter rivals. Charles II saw the well-developed and world-wide Dutch trading system as no less of a threat than had the merchants who had dominated the House of Commons during the previous decade. As colonies, particularly those in North America, became more important for the prosperity of both the English and the Dutch nations, tensions far removed from the North Sea and the English Channel increasingly had the capacity to drive the two countries back into war.

Awareness of this tense situation was not limited to London or Amsterdam. From the East Indies to the African coast to the Caribbean and the Atlantic seaboard of North America, wherever colonies of the two competitors found themselves in close proximity, there was the likelihood for competition to spill over into conflict. Isolated and independent fights were common. The Dutch East and West India companies and Dutch operations in West Africa were all more developed than any English colonial endeavor. Dutch colonial administrators were not hesitant to harass English shipping or activity in what they regarded as their own area of interest.

It did not take long before bitter complaints over this activity began to reach Parliament. In 1661 and again in 1663, Parliament authorized small squadrons to cruise the western coast of Africa and take reprisals against the Dutch for affronts both real and per-

Gov. of New Netherland Petrus Stuyvesant destroys a summons to surrender New Amsterdam to the English. Alienated by Stuyvesant's tyrannical rule, the people of New Amsterdam surrendered to the English without a shot being fired in 1664 during the Second Anglo-Dutch War. (Hulton Archive/Getty Images)

ceived. In January 1664, Captain Robert Holmes, in command of a small squadron, captured the Dutch fort of Goeree and attacked three other outposts in western Africa. When word of this reached the Netherlands, the Dutch government ordered Admiral Michiel Adriaanszoon de Ruyter to sail down the coast and retake the forts.

Before de Ruyter arrived, however, Holmes had departed the African coast and sailed across the Atlantic to attack New Amsterdam, the Dutch colony in North America. In August, Manhattan Island fell to the English squadron supported on land by a colonial force of militia from nearby English colonies such as Connecticut. New Amsterdam was promptly renamed New York in honor of King Charles II's brother, James, Duke of York and lord high admiral of the British Navy. De Ruyter, in response, hastened across the Atlantic himself and attacked English merchant fleets around Barbados. The Dutch formally declared war in January 1665. The English responded the following month, and the Second Anglo-Dutch War was on.

Both fleets were substantially more prepared for war in 1665 than had been the case in 1652. The Dutch had modernized and now relied

not on hastily armed merchant ships but on heavily armed ships of the line similar to those of the English. While each fleet had about the same number of total ships, Dutch ships rarely mounted as many and as heavy cannon as did comparable English ships. None, in fact, carried more than 76 guns, whereas the English boasted at least eight ships with between 80 and 100 guns. The heaviest English guns were 32-pounders, whereas 24-pounders were the heaviest guns shipped by the Dutch. The shallow bays and estuaries of the Netherlands limited the new Dutch ships to two gun decks, whereas the English possessed some deep-draft three-deckers. England also was moving toward a better organized fleet, separated into squadrons with lines of battle divided into van, center, and rear divisions, commanded by vice admirals, admirals, and rear admirals, respectively. Maneuvering into battle was now based on the line-ahead tactic.

The English were the first out of port and promptly moved to blockade the Dutch. While the Dutch fleet was assembling, the English took up station just outside the string of barrier islands known as the Texel. For more than two weeks the English fleet remained in place, capturing several merchant ships. But the Dutch did not emerge to challenge. Bad weather and a shortage of provisions required the English fleet to return to port, after which the Dutch fleet emerged in mid-May.

The first big battle of the war occurred on June 3, 1665, off Lowestoft on the eastern coast of England. The English fleet was led by Prince Rupert, Duke of Cumberland; James, Duke of York; and Edward Montagu, Earl of Sandwich (van, middle, and rear, respectively). The Dutch were led by Baron Opdam van Wassenaer, backed up by Cornelius van Tromp. Early that morning, the two fleets sailed past one another, both in line-ahead formation, exchanging heavy fire. The two lines then wheeled around and passed each other again, still exchanging fire the entire way. The sound of cannon fire could be heard all the way to London. The English tacked about and this time came on the same heading as the Dutch. Consequently, the exchange of fire became heavier and more continual.

Shot from the English ships ignited the magazine in Opdam's flagship *Eendracht*. A resulting massive explosion literally blew the ship apart and killed the admiral and all but five of the men aboard. Dutch ships then began to break out of formation, shattering the tactical integrity of the Dutch line. Soon the Dutch were in flight, but the English pursuit was halfhearted because of a dispute over who should assume command. Nonetheless, for the loss of only 1 of their own ships, the English captured 14 and sank 18 of the Dutch. While Lowestoft was a great victory for the English, the weaknesses it exposed manifested themselves again in later engagements.

In January 1666, France joined in the war on the side of the Dutch. The French Navy, in the midst of reform and modernization, suddenly became a serious concern of the English. To guard against the rumored arrival of a French squadron from the Mediterranean, the English chose to divide their naval strength. Against the resulting smaller force, the Dutch saw an opportunity. The fleet they assembled in the spring of 1666 was the strongest ever faced by the English to that point and actually outnumbered that of the English.

Beginning on June 1 when the fleets came into contact, the Dutch and English pounded one another. In the bloody running fight that became known as the Four Days' Battle, the Dutch took numerous English ships. When the battle ended with the Dutch breaking it off and returning to port, the English had suffered a tactical defeat. They had lost 10 ships and the Dutch only 4.

In the wake of the Four Days' Battle, much to the astonishment of the Dutch, the English were able to refit and refloat a substantial fleet within weeks. On August 4, 1666, St. James' Day, the two fleets met again, southeast of Orfordness. The English had 89 ships, the Dutch 88. It ended in an English victory and a subsequent attack on August 9 by English fire ships on Dutch merchant ships riding at anchor and the destruction of some 150 of them.

Despite this success, the English were under heavy financial strain from the war. Sailors' pay was in arrears and oftentimes ships put to sea with insufficient provisions. By the summer of 1667, the English crown was in such dire financial straits that the entire battle fleet was holed up at bases downstream from London in the Medway River. Charles believed that the Dutch were on the verge of collapse themselves, and that commerce raiding alone could carry the war that year.

This was an opportunity that de Ruyter could not let pass. In June his fleet sailed into the Thames estuary, up the fleet's primary anchorage of the Medway River, cut the protective booms, and burned, sank, or towed away numerous ships, including the English flagship *Royal Charles*. It was the darkest day in the history of the English Navy, and an utter humiliation for Charles II.

After the raid, de Ruyter kept up a blockade of the Thames. The English economy was crippled and Charles quickly opened negotiations. In a matter of weeks, on July 21, 1667, England, France, the Netherlands, and Denmark concluded the Treaty of Breda, bringing the Second Anglo-Dutch War to an end.

The English conceded to the Dutch demand that shipped goods would be covered by the flag of the ship on which they sailed, not the country of origin. This secured the Dutch carrying trade. Also the English modified some of the Navigation Acts to allow for more Dutch participation in English commerce. The main achievement for the English, on the other hand, came in America, where New Amsterdam (New York) remained an English colony.

Not only Manhattan Island but also several pieces of territory in the Western Hemisphere changed hands as a consequence of the war. In compensation for the loss of Manhattan, the Dutch retained control of Suriname on the northern coast of South America, increasing their presence in the Caribbean, whereas England regained control of the Caribbean islands of Antigua, Saint Kitts, and Montserrat, which had been taken by the French. Elsewhere in North America, the Treaty of Breda returned Acadia from English to French control.

Clearly the English had failed in their principal war aim to wrest control of the seas from the Dutch. The Dutch understood that they no longer had to win a war with the English but only to avoid defeat. In the wake of the Treaty of Breda, England and the Netherlands

temporarily laid aside their differences and, with Sweden, formed a short-lived alliance to resist the expansionist policies of King Louis XIV of France.

Anglo-Dutch War, Third

Start Date: March 13, 1672 End Date: February 9, 1674

Armed conflict that pitted the Dutch Republic against England and France. The Third Anglo-Dutch War was substantively different from the previous two conflicts between the English and the Dutch. The most obvious difference was that France inserted itself into the ongoing rivalry between the two powers. This action was in part prompted by the Dutch having joined England and Sweden in the anti-French Triple Alliance of 1668 in the wake of the Second Anglo-Dutch War. However, the primary French motive was King Louis XIV's desire for territorial aggrandizement. Despite longstanding animosity between the French and English and growing rivalries overseas in places such as North America, the two monarchies this time saw common ground.

King Louis XIV's chief minister, Controller General of Finance Jean-Baptiste Colbert, was more responsible than anyone else for a rapid and substantive buildup of the French Navy. He knew that England coveted Dutch trade (as did the French) but that apart from slight territorial change in North America, the two previous Anglo-Dutch Wars had done little to advance English ambitions. Colbert also understood the desperate need of England's King Charles II for money. Most important, Colbert knew that his own sovereign was bent on acquiring Dutch territory. An alliance with England, secured by French financial aid, could bring Louis XIV the territory he sought.

In 1670, the French government offered Charles II an annual payment of £200,000 (almost half the English naval budget) and the pledge of a French fleet that would operate under overall English command in concert with the Royal Navy if Charles would join his nation to France against the Dutch. On May 22, 1670, Charles agreed

Michiel Adriaanszoon de Ruyter, one of the greatest admirals in Dutch history and a key figure in the Anglo-Dutch Wars. (Hulton Archive/Getty Images)

and signed the secret Treaty of Dover. Charles not only secured desperately needed funds but also hoped to secure for England some territory in the Netherlands.

The war began on March 13, 1672, when English ships attacked in the Channel the Dutch Smyrna convoy, which nevertheless escaped. France then sent 120,000 troops to attack the Dutch frontier forts on land. Once again Admiral Michiel Adriaanszoon de Ruyter led the Dutch fleet at sea. He hoped to prevent the allied naval forces from combining and descending on the Netherlands. Owing to delays in the arrival of the Zeeland squadron, de Ruyter failed to prevent the allied convergence.

The French ships sailed to Portsmouth in early May and were there soon joined by the English fleet. Admiral Comte Jean d'Estrées, flying his French flag in the 78-gun *St. Philippe*, commanded an impressive force of 33 ships of the line and frigates, including 7 ships of 70 guns or more each. James, Duke of York, again led the English fleet, this time from the 100-gun *Royal Prince*, an imposing three-decker. The Earl of Sandwich was again his second in command. Shortly thereafter the allied fleets put to sea.

De Ruyter captured one French ship in the North Sea, then sighted the allied fleets on May 19. Although de Ruyter was anxious to engage the enemy force, heavy fog precluded this and the two fleets separated. Instead of attempting to renew contact with the Dutch, the allied fleet moved to Solebay (Sole Bay, today

Southwold Bay, Suffolk), England, on the English east coast, just south of Lowestoft.

Together the allied French and English possessed 74 ships of 40 guns or more, the Dutch but 62. In total number of ships, the English had 98 and the Dutch 75. The English and French ships were both heavier in tonnage and weight of broadside. Many of the English and French ships were also new, whereas the Dutch had launched no new ships since 1667.

Although he was outnumbered, on the morning of May 28 de Ruyter came on the allied fleet unawares and thus had the tactical advantage. The agreed-on tactic was to form in line-ahead formation. De Ruyter had adopted the line-ahead tactic as well, along with the English practice of forming his fleet into distinct and partially independent squadrons. He still intended, however, that the battle would be decided by close action and, if possible, boarding. Because the allies had been caught by surprise, they were not able to complete their line of battle as planned before battle was joined.

As de Ruyter bore down on the English and French ships, d'Estrées missed a crucial English signal flag and led the French ships generally southward. The English ships, once underway, sailed north. De Ruyter sent a smaller number of his ships after the French, mainly to contain them, but led the bulk of his force against the English.

The fighting, especially the action between the Dutch and English, was intense. James's *Royal Prince* was set afire and he had to transfer his flag not once but twice. The Earl of Sandwich eventually ordered his crew to abandon his ship, the *Royal James*, after it was set ablaze by a Dutch fire ship. Sandwich himself was killed transferring his flag. Ultimately, both sides were exhausted and the Dutch withdrew. Dutch losses included two ships and 1,600 killed, against the allied loss of the *Royal James* and 2,000 killed. Both sides claimed victory in the fiercest naval engagement of the three Anglo-Dutch wars, but de Ruyter had been successful in his immediate objective of preventing or delaying a direct allied naval thrust against the Netherlands.

Animosity between the allies flared in the wake of the battle, with many Englishmen accusing the French of cowardice or even treachery. Public sentiment throughout much of England was already aggravated by the French alliance. Since the end of the Second Dutch War, relations had actually improved between England and the Netherlands, and although few in England regarded the Dutch as friends instead of competitors (and many desperately wanted revenge for the Dutch raid on Medway in the second war that had destroyed much of the English Navy), most saw Catholic France as the real foe.

As events at sea unfolded, the French Army took the field. As Louis XIV's armies drove on Amsterdam in 1672, the Dutch government was obliged to open miles of dikes protecting the city and flood much of the low-lying countryside. This desperate move stopped the French and saved the Dutch Republic.

In May 1673, in preparation for an English invasion of the Netherlands, Prince Rupert of the Rhine, who had replaced James as commander of the English fleet on account of the latter's conversion to Catholicism, led an attack on the Dutch fleet in its coastal anchorage. In the ensuing May 28 and June 4 battles of Schooneveld (a long, narrow basin controlling seaborne access to the Scheldt and Maas rivers), de Ruyter with 52 ships contested and drove off 76 heavier gunned and better manned English and French ships under Rupert and Comte d'Estrées. The net effect of the battle was that the English expeditionary force remained in port. De Ruyter then went on the offensive, driving the English ships into the Thames, but he was forced to raise his blockade of the river on the outbreak of plague aboard his ships.

In August, the last great sea fight of the war occurred off the Dutch coast. Following completion of repairs in mid-July, Prince Rupert took the English fleet of 62 ships of the line and frigates to sea, where they joined 30 French ships of the line and frigates under d'Estrées. Counting fire ships and smaller vessels, the allies had 143 ships. On July 17, the allied fleet, transporting a large number of soldiers, sailed for Scheveningen to effect a landing. De Ruyter put to sea from Schooneveldt at about the same time as the allies. He had 115 vessels, including 70 ships of the line and frigates.

The allies refused battle and, after inconclusive maneuvering, de Ruyter returned to port. The Prince of Orange then ordered de Ruyter to do battle, but bad weather delayed the Dutch fleet sailing until August 7, when de Ruyter made for the Texel, a coastal island, where the allied ships were reportedly located. The two fleets sighted one another on the morning of the 10th.

De Ruyter fought the ensuing August 11, 1673, Battle of the Texel (also known as the Battle of Kijkdiun) with great skill. No ships of the line on either side were lost, although the Dutch inflicted many more personnel casualties because of the large landing force aboard the English ships. Despite the inconclusive nature of the fight, de Ruyter had freed the Dutch ports from blockade and frustrated the allied invasion plans.

Fighting also occurred overseas. The British repulsed a Dutch attack on Bombay but, in the New World, a Dutch squadron under Cornelius Evertsen ("the Youngest") and Jacob Binckes, wrought considerable destruction to the French possessions in the West Indies, then sailed north. On July 28 it appeared off New York, which several days later was forced to surrender. Before the Dutch had lost it as a consequence of the Second Anglo-Dutch War, the colony had been known as New Amsterdam. Now the Dutch named it New Orange.

Bereft of funds to continue the fight in the teeth of public opposition, Charles II on February 9, 1674, reluctantly signed the Treaty of Westminster. This took England out of the fight, ending the third, and last, Anglo-Dutch War. The treaty was quite advantageous to the English. The Dutch agreed to strike their flag in the Narrow Seas (English Channel), places taken by either side during the war were to be returned (thus New Orange reverted to New York), and the Dutch agreed to pay an indemnity of 800,000 crowns (which, however, was in effect cancelled out by debts owed the English crown to the House of Orange). In December, both sides concluded a treaty

of commerce. Most important for future developments, in 1677 the Anglo-Dutch alliance was recognized in the marriage of Princess Mary of York to William Prince of Orange.

The war between the Dutch Republic and France continued for four more years, with Spain and Austria ultimately joining the fight against France. When peace was finally restored in 1678, the Dutch regained all the territory lost on land. Nonetheless, the severe financial strain of the war and the need to maintain an effective land force against possible future French aggression, assisted the English in their quest to control the seas, for they were able to concentrate on the fleet alone. Also, during the continued fighting between the Dutch and France, English shippers were able to secure much of the Dutch carrying trade.

The three Anglo-Dutch Wars brought about fundamental changes in the English Navy as well as new tactics, helping it to prepare for the next struggle at sea, this time with France. Politically, the conflict saw the rise of William of Orange, future king of England and architect of the alliance against France that would initiate a century of intermittent global conflict.

Anglo-Powhatan War, First

Start Date: August 9, 1610 End Date: April 5, 1614

The first war between a Native American nation and the English, which began in Virginia in 1610. The main catalyst for war was European encroachment on traditional Powhatan lands and the latter's violent reaction to these usurpations. With the end of the war, the issue of land ownership remained unresolved as European settlements covered an ever increasing area. In the end, the only solution for the Native Americans was to retreat to the interior in the face of steady European migration westward.

It took only three years for large-scale violence to erupt between Native Americans and English settlers, who had arrived at Jamestown in 1607. Sporadic violence between the colonists and the Powhatans had taken place from the beginning, but leaders on both sides had tried to exercise restraint. There was, of course, a clash of cultures but the concept of land ownership was the chief cause of antagonism. The natives used land communally; private ownership was an entirely foreign concept for them. Europeans, on the other hand, believed strongly in private land ownership and erected fences and walls to demarcate such ownership. As more and more Europeans arrived in Virginia, they also cut down the forests and killed or drove away the game on which the natives depended for both food and clothing.

Chief Powhatan, leader of the confederacy of tribes that bore his name, naively believed that he could tolerate a colonial trading post at Jamestown, where his people would have access to European trade goods, such as metal tools. It took three years for Powhatan to realize that Europeans had come to the new world not to trade but primarily to obtain land, land heretofore within his area of control. In the end, war was Powhatan's answer to European encroachment.

Although the Europeans possessed firearms, Powhatan's warriors were armed with the bow and arrow, a highly effective weapon in the early 17th century. The natives also enjoyed the advantage of knowing the land.

In 1610, Powhatan informed the Jamestown settlers that he would tolerate no further exploration of the region. He also warned the English to restrict themselves to Jamestown, the trading post he had desired from the beginning. Almost immediately after Powhatan's warning, on July 6, 1610, members of the Nansemond tribe murdered a group of English settlers who were living among them.

That summer, Thomas West, Lord de la Warr, newly arrived governor of Virginia, chose to ignore Powhatan's continuing threats and sent a group of explorers up the James River to search for valuable minerals. At the time, the colonists still harbored quixotic visions of becoming rich from discoveries of rare minerals such as gold and silver. At the Indian village of Appomattox, the natives convinced the explorers to enter their village to eat and rest. The explorers naively accepted the offer, and all but one were slain.

The settlers sought retribution and, acting on de la Warr's orders, on August 9, 1610, George Percy, a member of the powerful Northumberland family who had been appointed a deputy in the colony's government, led 70 men to the village of Paspahegh of the Powhatan Confederation. There the English took captive a wife and children of Chief Wowinchopunch, who ruled the town but was subordinate to Powhatan. His wife was taken into the woods and killed. Once they reached the James River, the English threw the children into the water and shot them as they struggled to escape. In all some 50 natives were slain. Wowinchopunch vowed revenge for the attack. Percy's men burnt some other Indian villages and seized their stocks of corn before returning to Jamestown.

The fighting quickly spread. Native warriors, led by Opechancanough, attacked Jamestown and laid siege to its fort. The settlers raided native villages and burned crops. Over a three-year span, both sides continually harassed the other, although no pitched battles occurred. The actual number of fatalities on both sides is unknown.

The war was fought native-style, replete with ambushes, kidnappings, and torture until 1614. Powhatan's favorite daughter, Pocahontas, had been lured aboard an English ship and captured by Captain Samuel Argall and held hostage since April 1613. Three months later Powhatan agreed to negotiate an end to the violence and offered the English food in return for his daughter's release. Argall saw the value of his prisoner and made greater demands; Powhatan accordingly offered a considerable ransom for Pocahontas's return. In the meantime, English reinforcements arrived, lifting the native siege of Jamestown.

In the end, the English arrived at a political solution. John Rolfe had settled in Jamestown in 1610. He introduced tobacco as a cash crop and was among the wealthiest of Virginians. Rolfe and Pocahontas married at Jamestown on April 5, 1614. The wedding of Powhatan's daughter to one of the most important men in Virginia sealed the peace agreement, which required Powhatan to return all of the English captives, runaways, tools, and firearms in his people's possession.

Anglo-Powhatan War, Second

Start Date: March 22, 1622 End Date: 1632

Armed warfare between the Powhatan people and English settlers near Jamestown, Virginia. Also known as the Virginia-Indian War, the Second Anglo-Powhatan War began on March 22, 1622, with a massive, surprise assault by the Powhatans on the English settlers near Jamestown.

The Powhatans' attack stemmed from native fears that the English were becoming too numerous and were taking too much territory. But hostilities had been simmering between the English and the Powhatans since the end of the First Anglo-Powhatan War (1610–1614). The Powhatans were frustrated by English exploration, their demands for food, and the way in which they self-righteously pushed their culture and religion on them.

After Chief Powhatan settled that first war without a victory in 1614, his actual power declined. Although Powhatan remained paramount chief until his death in 1618, his younger brother Opechancanough and others hostile to the English dominated Powhatan diplomacy after that time.

For years, Opechancanough lulled the colonists into a sense of security with friendly overtures and by ignoring their abuses. The English saw the period between 1613 and 1622 as a golden age in their relations with the Powhatans. They traded freely with the natives and frequently welcomed them on their plantations and in their homes. The English thus felt shocked and betrayed when the attack occurred.

While Opechancanough was appeasing the English, he quietly negotiated with the various Powhatan tribes to join in a fight that would eliminate the English threat. More tribes were persuaded to fight after 1617, when tobacco became an extremely profitable crop in Virginia. Between 1617 and 1622, some 3,000 English settlers arrived to take advantage of the tobacco boom. Thus, settlement spread far beyond Jamestown and put unprecedented pressure on the local natives.

Just before the first assault on March 22, 1622, two Powhatans betrayed Opechancanough's plans and warned the English of the coming attack. Nonetheless, the native offensive was indeed costly to the colonists. The Powhatans killed 347 settlers that day, about one fourth of the entire English population in the colony.

Once the colonists regrouped from the devastating March attack, bitter fighting ensued between them and the Powhatans. The English launched raids against Powhatan towns and sniped at any native in range of their firearms. They made treaties with the Powhatans only to break them, as in 1623 when they brought poisoned wine to a feast to toast a new peace accord.

Still, nearly another quarter of the English population died in the following year from small-scale native raids, starvation, and from dysentery and other diseases. The climax of the war came in a large-scale battle at the town of Pamunky in 1624, in which the English were victorious. The native threat to the English diminished greatly after the battle, and peace was finally negotiated in 1632.

The Second Anglo-Powhatan War permanently changed English views toward Native Americans. Prior to 1622, many settlers envisioned living harmoniously among the natives, whom they expected to convert to Christianity and English cultural mores. The English, however, had not recognized how these goals were nearly impossible to achieve. Working against them were deep-seated cultural differences, and their desire to settle on "unoccupied" native land. As a result of the betrayal the English suffered by the conflict, they no longer desired to incorporate Powhatans as English subjects. Most English now wanted to rid the land of natives altogether, or at the least to keep them as servants or slaves.

Another result of the war is that King James I came to believe that the Virginia Company of London was mismanaging the colony and endangering the lives of the settlers. In 1624, the king declared

Depiction by Matthaeus Merian in 1628 of a surprise attack by Powhatan Native Americans on the English in the area of Jamestown on March 22, 1622. A total of 347 settlers died in the attack. (MPI/Getty Images)

Virginia a royal colony, which gave the settlers many new rights that they had not enjoyed under Company control.

Anglo-Powhatan War, Third

Start Date: March 18, 1644 End Date: October 1646

The last major conflict between the English colonists and Powhatan Confederacy in Virginia. Also known as the Virginia-Indian War of 1644–1646, it broke the power of the Powhatans forever.

Following their defeat in the Second Anglo-Powhatan War, the natives had watched the growing number of settlers in Virginia occupy more and more Powhatan land. Eager to profit from the sale of tobacco, a crop that rapidly depleted the soil, the English expanded their settlements from the area along the James River to the territory on the York, Rappahannock, and Potomac rivers. At

Opechancanough, a leader of the Powhatan Native Americans in Virginia and younger brother of the powerful sachem Powhatan. An important negotiator with the English settlers, Opechancanough later led raids against them, including the massacre of English settlers around Jamestown in 1622. (North Wind Picture Archives)

the same time Virginia's settler population grew rapidly, reaching an estimated 8,000 people in 1640.

Opechancanough, the Powhatan leader, had few options. His people, whose population had dwindled below its 1622 level, had been pushed to the far western reaches of their land. If the Powhatans chose to abandon their homes and try to reestablish themselves among their native enemies in the West, they might lose their cultural identity and possibly their lives. To allow the English to occupy their remaining territory would render the Powhatans powerless, and the destruction of their culture was certain. War, the only remaining choice, seemed reckless given the odds against the Powhatans and the likelihood that defeat would mean annihilation.

Although Opechancanough was elderly (perhaps nearly 100 years old) and frail, his determination remained strong. Believing that the turmoil caused by the English Civil War might distract the Virginians and perhaps even bring Catholic Maryland into alliance with the Powhatans, he organized an attack on the Virginia settlements. Opechancanough also had the support of the native tribes along the Rappahannock.

The Powhatans and their allies struck on March 18, 1644. Borne on a litter by some of his men, Opechancanough led attacks on plantations in the heart of the English settlements along the James River. Other native parties attacked settlers on the upper reaches of the York and Rappahannock. The assault took the colonists by surprise, and 400–500 were killed in the natives' initial onslaught. Many others abandoned their farms and took refuge in fortified

buildings. Although the Powhatans had killed many more settlers than in their attack of 1622, the impact of the new attack was less significant. While the attack of 1622 killed a quarter of the English population, that of 1644 brought the deaths of one-twelfth of the settlers.

As in 1622, the Powhatans hesitated after their initial victories. Regrouping swiftly, the Virginians launched counterattacks against the natives' towns, burning buildings and crops and killing any natives they found. Within six months, the settlers had reoccupied all of their abandoned plantations and the Powhatans and their allies were in retreat. Sporadic fighting continued until the late summer of 1646, when Opechancanough was captured and brought to Jamestown. Shortly afterward, he was murdered by one of his guards who shot him in the back.

Opechancanough's death marked the end of Powhatan resistance. His successor, Necotowance, signed a treaty with Virginia in October 1646 in which the Powhatans ceded most of their remaining land to the English. The natives would henceforth be confined to the small portion of their territory allotted to them by the victors, in effect the first Indian reservations in North America. The Powhatans also agreed to surrender all English prisoners and firearms, to return any runaway servants who might come to them, and to pay an annual tribute of furs to Virginia. Unfortunately, only a few years passed before the English were again covetous of the land left to the Powhatans in the treaty. Thus, in less than 40 years, the powerful Powhatan Confederacy had been destroyed and English domination of the tidewater region of Virginia had been secured.

Anglo-Spanish War

Start Date: August 11, 1718

End Date: 1721

Relatively minor conflict between Britain and Spain arising from a European war. The Anglo-Spanish War in North America, which began in 1718, was part of a larger struggle in Europe, where the conflict was known as the War of the Quadruple Alliance. In the years following the 1713 Treaty of Utrecht, Spain sought better rela-

tions with Great Britain, and the two nations had signed commercial treaties in 1715 and 1716. However, when Britain signed the Treaty of Westminster with Austria in November 1716, Spanish officials considered the agreement a threat to their ambitions in Italy, where Austria controlled territory coveted by Spain's King Philip V. Concern over Spain's Mediterranean policies and King Philip's dynastic claims to the French throne led Britain, France, and the Netherlands to form the Triple Alliance on January 4, 1717.

Spain opened hostilities in November 1717 by seizing Sardinia from the Austrians, and in July 1718 Spanish forces captured Sicily, a territory of Savoy. Austria responded on August 2, 1718, by signing the Treaty of London in which the Netherlands withdrew from the Triple Alliance and Savoy and Austria joined Britain and France in the Quadruple Alliance. The tide immediately turned against Spain, as a British fleet under Admiral George Byng destroyed Spain's naval forces in the Mediterranean at the Battle of Cape Passaro on August 11, 1718. British vessels also landed Austrian troops in Sicily.

The Spaniards countered with an attempt to incite an uprising in the French province of Brittany in 1718, and in 1719, 300 Spaniards landed in Scotland in hopes of inciting a Jacobite uprising. Both efforts failed. France retaliated by invading the Basque region of Spain in April 1719. And the British Navy exacted retribution with raids against the Spanish coast. The Netherlands declared war on Spain in August 1719.

Little fighting took place in North America between Britain and Spain, however. Spanish officials in Florida labored to consolidate their position there in case of a British attack. The post at Apalachee, which provided a link between St. Augustine on the Atlantic and Pensacola on the Gulf of Mexico, was reestablished, and the Spaniards strengthened their ties with the Creeks. The British, however, took no action other than to shore up their own defenses by constructing forts to protect the frontier of South Carolina. The Spanish hoped to mount an attack on the Bahamas and South Carolina, but the campaign was postponed when the fleet sailing from Havana to attack Charles Town (present-day Charleston, South Carolina) was diverted to retake Pensacola, which had fallen to the French. At sea, warships and privateers from both sides engaged in commerce raiding.

The most severe fighting in North America was between France and Spain, and centered on Pensacola, which fell to the French early in 1719. The Spanish forces that had been diverted from the invasion of South Carolina recaptured the town in August 1719, only to lose it again a month later. A Spanish attack on the French at Mobile—also in August—was repulsed.

Warfare almost erupted between Britain and Spain in 1721, when the British established Fort King George on the Altamaha River (present-day Georgia) on territory claimed by Spain. South Carolinians also accused the Spaniards of giving refuge to escaped slaves. By then, however, the European war had ended with the signing of the Treaty of the Hague on February 17, 1720. Both England and Spain therefore sought a diplomatic solution to the

Florida-Georgia border dispute, which became moot when a fire destroyed Fort King George in 1725.

Anglo-Spanish War

Start Date: October 1739

End Date: 1744

A conflict, also known as the War of Jenkins' Ear, between Spain and Britain during 1739–1744, fought mainly over commercial interests, which merged with the War of the Austrian Succession (King George's War) in 1744, when France entered the war. The Anglo-Spanish War broke a relatively peaceful interlude after the Treaty of Utrecht, signed in 1713. Although the American colonies would play an ancillary role in the war, fighting over English and Spanish possessions in southeast America was important in determining the future course of the empires.

Clashes over imperial commercial interests played a large part in the outbreak of the war. The Treaty of Utrecht allowed the British to sell slaves and one shipment of goods per year in the Spanish West Indies. But British merchants often exceeded the treaty's limits, and Britain became indignant about Spain's practice of boarding and searching its vessels for contraband. One such incident occurred in 1731, when the Spanish cut off the ear of a British seaman, Robert Jenkins, during a boarding skirmish. Amid rising tensions in 1738 over freedom of the seas, Jenkins brandished his severed ear before Parliament as an example of Spanish atrocities toward British merchantmen in the West Indies. His declaration committing his soul to God and his cause to his country helped whip the public into a frenzy of indignation over Spain's armed searches of British merchant ships. Despite Spain's offer to compensate English merchants, it did not repudiate the right to search. As a result, Prime Minister Sir Robert Walpole's government declared war on Spain in October 1739.

England quickly established a clear set of war aims. Following an ambitious policy of aggressive commercial imperialism, the British hoped to destroy Spain's shipping, interdict its trade, and take possession of territory in the Spanish empire, particularly the disputed land in southeastern North America. The British had previously established Georgia as a military buffer state between English South Carolina and Spanish Florida, setting up forts in strategic locations and building settlements with security in mind. A fortified Georgia, however, threatened Spain's empire in North America, especially

Florida, which protected Spanish Cuba as well as Spanish shipping in the Gulf of Mexico and the Bahama Channel. As English colonists pushed their settlements as far south as the periphery of St. Augustine, Spain feared for the survival of Florida. Under the leadership of Colonel James Oglethorpe, the English colonists constructed Fort Frederica on St. Simon's Island and two more forts on Cumberland Island in the 1730s.

After attempts to settle on an Anglo-Spanish boundary between Georgia and Florida failed, Spain and England prepared for war. Spain sent supplies from Cuba in anticipation of an invasion of Georgia, whereas England sent 700 men to Georgia under Oglethorpe's command. With international tensions already brewing in Europe, the construction of Fort St. George on the St. Johns River, the gateway to interior Florida, led to the outbreak of hostilities between Britain and Spain in 1739.

On learning of the official declaration of war, Oglethorpe acted quickly. With a force of 200 men, he captured two Spanish forts behind St. Augustine and prepared for an attack on the fortress itself. With 1,200 Georgians, South Carolinians, and Native Americans, as well as a Royal Navy squadron of four 20-gun ships, Oglethorpe set out to attack St. Augustine in the spring of 1740. Disease and exposure to the oppressive Florida summer decimated the fighting strength of his men, however, and Oglethorpe could only manage an ineffective shelling of Fort San Marcos before calling off the siege. Britain's plan to expel Spain from Florida was thus put on hold.

The English also focused attention on Caribbean conquests. A small British fleet under Vice Admiral Edward Vernon captured Portobello, located near the northern point of the Isthmus of Panama, in November 1739. England's attempt to capture Cartagena, a fortified seaport on the northern coast of South America, however, was a dismal failure. Disease and supply shortages plagued the offensive. Out of roughly 3,600 American colonial recruits, only about 600 survived the expedition. Britain blamed the defeat on its colonial forces, considering them untrained and inexperienced, and so a visible distrust between the English and American colonials began to emerge.

Spain, meanwhile, had not given up on its desire to push the British out of Georgia, and in the fall of 1741, King Philip V issued orders for an attack on Georgia and South Carolina. Spanish forces, totaling as many as 1,800 men and under the command of Manuel de Montiano, began the assault the following spring. In a matter of weeks, the invasion crumbled in the face of Oglethorpe's stiff resistance, and Spanish fear of the appearance of the Royal Navy led to a withdrawal of their forces. Now a hero in the American colonies, Oglethorpe once again set off to attack St. Augustine in March 1743, but victory remained elusive. Returning to England, Oglethorpe continued the fight in Europe and eventually rose to the rank of full general in the army.

By the beginning of 1744, the Anglo-Spanish War in America had become a stalemate, and France reemerged as England's primary imperial rival. In addition to dynastic and territorial concerns in the Old World, the significance of worldwide commerce and empire in the New World was pushing the traditional enemies toward war. In

March 1744, the two countries made it official. Known as King George's War in America, the War of the Austrian Succession continued for another four and a half years.

Apalachee Revolt

Event Date: February 1647

Insurrection of the Apalachee Native American people against the Spanish in Florida. In response to a variety of grievances, disputes with Spanish officials, and fears of Spanish colonization, Apalachee warriors revolted against Spanish missionaries in 1647. The Spaniards had developed friendly relations with the Apalachees beginning in 1597. After the initial meeting between the two nations, informal missionary work began throughout the province, but officially sanctioned missions did not appear in the Apalachee province until the early 1630s.

Unlike other areas where the Spaniards built missions, officials in St. Augustine considered the Apalachee province an excellent location for a future settlement. Thus, the government in St. Augustine kept a closer eye on the activities of its missions there than in other Spanish-administered areas. Despite the extra attention, however, the Franciscan friars entered Apalachee communities and went to work converting the native population. By 1635, approximately 5,000 of the 34,000 residents of Apalachee had converted to Catholicism.

Despite the Franciscans' successes, the missionaries injected significant tensions in Apalachee communities. Compared to Catholic missionary work elsewhere, the Spaniards in Florida rarely entered an area with a heavy hand. By the late 1630s, however, Spanish soldiers entered the province and tensions between the Apalachees and Spaniards increased.

In part, the soldiers entered the area to provide protection for the missionaries and act as peacemakers between the Apalachees and their neighbors. Prior to the arrival of the missionaries, the Apalachees had fought nearly constant wars with their neighbors. The Florida government hoped to establish Spanish settlements in the Apalachee province, however, and to many Apalachees the first soldiers brought a glimpse of a future dominated by the demands of the Spanish government.

Spain's desires to settle the area became very clear when St. Augustine appointed an official governor of the province in 1645. The Apalachees were to become something more than just a target for conversion; they were to be colonized. As more Apalachees converted to Catholicism, additional conflicts emerged between the converted and those who rejected the new religion. Catholic friars and converted native peoples began to eliminate and ban traditional religious practices. Also, any social activities considered offensive to the Catholic faith were forbidden. For the Apalachees who had rejected the new religion, these changes represented a cultural attack. Internal dissent coupled with a growing Spanish presence helped create an environment primed for rebellion.

Factions within the Apalachee community ultimately led to revolt. In February 1647, Apalachee warriors attacked, killing three friars in the initial raid. In addition, the leaders of the revolt captured and killed the deputy governor and his family. After killing the principal leaders at Mission San Luis, the Apalachees moved throughout the region, destroying seven of the eight Catholic compounds. Most participants in the revolt were non-Catholics, but the warriors also received help from members of the neighboring Chisca community.

When authorities in St. Augustine learned of the revolt, the reaction was swift and strong. Officials sent a large group of Timucuan warriors and several dozen Spanish soldiers to quell the rebellion. The Apalachees, however, stood their ground and fought the Timucuans to a draw. Shortly after the initial response to the revolt, Timucuan, Spanish, and Christian Apalachee forces came together to fight the rebellious faction. Ultimately, these combined forces prevailed, capturing and executing the leaders of the revolt.

Unlike other native revolts, this one did not drive the Spaniards from the area. Instead, Christian Apalachees found common cause with the Spaniards and together each side helped rebuild Apalachee province and its missions. Once reconstructed, Catholic missionaries continued their efforts with the Apalachee communities until virtually every inhabitant of the province accepted Christianity.

Apalachees

A group of Native Americans that lived in the Florida panhandle area through the 18th century. Prior to European contact, the Apalachee chiefdom participated in a trade network that spanned much of Florida and extended through Georgia, Alabama, and the Mississippi River Valley. As soon as the first Spaniards crossed Apalachee territory in the early 16th century, however, the Apalachees became associated with the Spaniards and conducted most of their business with Europeans, a relationship that eventually turned deadly.

According to anthropologists, the Apalachees assumed many characteristics of Mississippian cultures. The Apalachees spoke a language related to the Muskhogean language family, organized their communities along the lines of other Mississippian cultures, and accepted a shared leadership by peace and war rulers. In the early 17th century, Catholic missionaries entered Apalachee Province.

Before the first missionaries constructed churches and attempted to convert the natives, the Apalachees interacted with the Spanish government based in St. Augustine, Florida. Initial contact between the two nations helped curb tensions between the Apalachees and their frequent enemy, the Timucuas. Timucuan and Apalachee communities maintained a near-permanent state of war; thus the arrival of the Spaniards created a power structure that settled many of these disputes.

The Franciscan Order built the first missions in Apalachee Province in the 1630s. Tensions between the newcomers and the Apalachees followed a familiar pattern seen throughout Spanish North America, but when soldiers accompanied missionaries in the late 1603s, hostilities came to a head. Apalachee violence against the Spaniards peaked with the Apalachee Revolt in 1647. Following the violence, Spanish officials took a more active role in the management of the Apalachee Province.

Authorities in St. Augustine viewed Apalachee Province as an ideal location for settlement expansion. After the revolt, St. Augustine instituted a labor requirement known as the *repartimiento*. According to this system, Apalachees were expected to provide food and labor for the benefit of the Spanish crown and the protection it provided. In the late 17th century, this tribute grew to include mandatory labor on Spanish fortifications such as the Castillo de San Marcos and participation in wars Spain fought against regional native communities.

Throughout the remainder of the 17th century, the Apalachees and Spaniards clashed frequently. Although most members of the Apalachee community accepted Catholicism, many refused to bow to other Spanish demands. When the British settled Carolina in 1670, Apalachees and Spanish interests came together for the purposes of mutual defense. Unfortunately, the Spaniards could not defend the Apalachees, and in a series of raids in 1704, James Moore, governor of Carolina, captured hundreds of Apalachees as slaves. As a result of Moore's attack and slave raids by other native communities, the remaining Apalachee fled to Pensacola and dispersed under Spanish protection in the early 1700s.

Appleton, Samuel

Born: 1624

Died: May 15, 1696

Major in the Massachusetts Militia and commander of Massachusetts Bay forces in the western theater during King Philip's War (1675–1676). Samuel Appleton, born in Little Waldingfield, England, in 1624, came to America with his parents in 1635 and settled in Ipswich, Massachusetts. The Appleton family was prominent in political and military affairs. In 1668, Appleton was named a deputy to the colony's general court. He was first chosen lieutenant of the Ipswich Militia in 1669 and then promoted to captain in 1673.

With the outbreak of King Philip's War in 1675, Appleton was appointed the leader of an expeditionary company and ordered to the western frontier of Massachusetts Bay to protect settlements there under the command of Major John Pynchon. Stationed in the town of Hadley, Captain Appleton and his company patrolled the local area and responded to the October 5, 1675, attack on nearby Springfield. Appleton and other relief forces arrived too late to save the town, which was mainly destroyed by fires set by the attacking natives. Later that month, Major Pynchon, the leader of the Springfield settlement in addition to being the local military commander, asked to be relieved of his military duties in order to rebuild Springfield. The general court agreed and advanced Captain Appleton to the post of commander in chief of the western theater.

Appleton continued Pynchon's strategy of defending every frontier town, a tactic with which allied Connecticut disagreed. From October until December, Appleton and the Council of Connecticut exchanged an angry barrage of letters about the proper strategy for the region and the necessity of keeping Connecticut troops in Massachusetts. On October 19, Appleton and his men were instrumental in fighting off a large Native American assault on Hatfield. In this they had the assistance of the very Connecticut troops who had sought to return home.

In December 1675, Appleton, now promoted to major, was directed to take command of the Massachusetts contingent in the campaign against the Narragansett Indians in Rhode Island. Appleton and his men were said to have formed the storming column that ultimately gained access for colonial forces into the Indian fort. In the battle and subsequent retreat, Appleton lost 4 men killed and 19 wounded out of his company. Shortly after the Battle of the Great Swamp and the "Hungry March," Appleton retired from active service. He remained prominent in political circles, and was later arrested for his resistance to the Andros government of the Dominion of New England. Later released, Appleton was made a member

of the highly placed colonial council under the new government. Appleton died in Ipswich on May 15, 1696.

Appomattocks

Native Americans residing in eastern Virginia. The Appomattocks belonged to a group of Algonquian-language tribes living in eastern Virginia that the leader Powhatan organized into the Powhatan Confederacy in the late 16th century. They lived in the area at the falls of the James River and adjacent to a James River tributary, the present-day Appomattox River. Captain John Smith noted the presence of their village in a 1612 map summarizing his earlier explorations of the region.

Much of the history of the Appomattocks is bound up with that of the Powhatan Confederacy. Powhatan, their chief, oversaw a confederacy of similarly cultured tribes, each owing their ultimate allegiance to Powhatan but retaining some local governing institutions (such as their own chief, called the *werowance*) and a sense of their ethnic identity. It was the confederacy's great task to confront the colony at Jamestown and the growing English expansion up the James River and beyond. Powhatan employed a number of both conciliatory and hostile methods for checking English encroachment, most notably the legendary rescue of captured English leader John Smith by his daughter Pocahontas. While some members of the Powhatan Confederacy maintained peaceful—or sometimes ambiguous—relations with the English, the English viewed the Appomattocks as generally hostile.

Indian-English relations deteriorated with the death of Powhatan in 1618. Growing English pressure on Indian lands probably meant an inevitable escalation of hostility. Powhatan's successor, Opechancanough, pursued a much more confrontational policy that became open warfare after a 1622 Indian retaliatory raid that killed more than 300 English settlers. As members of the Powhatan Confederacy, the Appomattocks were caught up in the resulting conflict. The years from 1622 to 1624 and 1644 to 1646 were ones of violent warfare that claimed lives and property. In 1646, Opechancanough was captured, ending all hope for a successful campaign against English conquest of native lands in eastern

Virginia. After 1646, the fate of the Appomattocks, along with all the natives of eastern Virginia, had been sealed.

By the mid-1640s, the Appomattocks had abandoned some of their traditional lands. The site of the native village of Appomattock switched over to English rule in 1652. English settlement marched steadily up the James River, displacing the Appomattocks with settlements and thriving tobacco plantations. During this time, the Appomattock population declined and their land holdings continued to shrink.

The fate of the Appomattocks indeed may have been sealed with the Treaty of Middle Plantation. Originally signed by area tribes in 1677, the Appomattock *werowance* was not allowed to sign until 1680. The treaty made the signers subjects of the British crown. After 1680, documentary evidence of the Appomattocks is scarce, until their final mention in the early 18th century. Their last appearance in the historical record is the word "Appomattock" engraved on a bronze badge (probably issued in 1711), which was likely given to Indian tribes as hunting permits by the government. Their name survives only in the Anglicized version, "Appomattox," which names both the town of Appomattox and the river.

Arkansas Post

A succession of French and Spanish trading posts and fortifications, located at various points along the Arkansas River, roughly 5 to 30 miles west of the Mississippi River. Indian raids, flooding, and the changing course of the Arkansas River necessitated frequent relocation. Arkansas Post was the first European settlement in the lower Mississippi Valley.

The last of the French forts was described in the 1760s as a quadrangular stockade about 180 feet long on each side, situated 200 yards from the Arkansas River. It had 3-pounder cannon mounted on the flanks and faces of its bastions. Within the stockade were a three-room barracks, the commander's house, a powder magazine, a provisions magazine, and a commissary apartment. There were eight houses with families nearby. The inhabitants subsisted by hunting and by exporting bear oil, tallow, salted buffalo meat, and a few animal skins each year to New Orleans.

Replica of the cross marking Henri de Tonti's 1686 French trading settlement, Arkansas Post National Memorial, Arkansas. (North Wind Picture Archives)

René-Robert Cavelier de La Salle landed at the Quapaw Indian village of Osotouy on March 14, 1682, and granted a seigneury (a feudal style land grant) on the Arkansas River to his lieutenant, Henri de Tonti. In April 1686, while searching for La Salle, who had disappeared, Tonti left six Frenchmen and four Native Americans at Osotouy. Their assignment, while watching for La Salle, was to erect a cross and build a fur-trading post (activating Tonti's seigneury) and thus demonstrate France's sovereignty in the region. This constituted the founding of Arkansas Post (from "Akansea," the Illinois name for the Quapaws). Tonti's trading operation failed, however, and it appears that the original Arkansas Post was abandoned in 1699.

During 1719–1720, the area was the center of a failed project initiated by a Scot named John Law, to settle Alsatians and African slaves. In association with this project, the first actual military detachment, commanded by a lieutenant, arrived in 1721. In 1726, the Jesuits assumed responsibility for relations with the Quapaws, and the small military presence withdrew. In 1728, however, the resident priest died, leaving the post vacant.

Then, in 1732, an ensign and 12 soldiers arrived to build a small fort, the first actual military structure, at or near the site of the original Arkansas Post just north of the Arkansas River. During 1751-1755, a larger fort was built farther upstream on the higher ground of Écores Rouges ("Red Bluffs"), where it was closer to the nearest settlement and farther from the flooding. This one had a palisade 720 feet long and 11 feet high; it encircled 10 buildings. In 1756, however, this too was abandoned in favor of a new structure (described above) in a swampy area south of the Arkansas River and only five or six miles west of the Mississippi River. There it would be more useful to convoys plying the Mississippi during the French and Indian War (and there it remained until it returned to Écores Rouges in 1779). In 1756, the garrison numbered 60. That declined to 31 in 1763 and 15 in 1770.

France ceded the Louisiana Territory to Spain in 1762. The Spanish formally took possession of the Arkansas Post in 1766, but French officers remained in command at least through 1770. At about that time, the post was renamed Fort Carlos III. After that, most of the enlisted men, and several of the commanding officers, were French soldiers who declared an oath of loyalty to Spain. Spain surrendered the post to the United States in 1804. The territory had been ceded back to France in 1800 but then sold to the United States in the Louisiana Purchase.

The community at Arkansas Post never prospered. A French census taker in 1726 commented that "the people are all poor, and they live only from the hunting of wild animals." Later descriptions were similar, if more derogatory. Nevertheless, Arkansas Post played a role in maintaining relations with the Quapaws, who proved a reliable ally to the French, especially against the Chickasaws (a British ally). It also served as a stopping point between France's Illinois and the Gulf Coast settlements. A Loyalist raid on the post in 1783 was surely the only action of the American Revolutionary War fought in Arkansas. Arkansas Post was also the first capital of the U.S. territory of Arkansas, and a Civil War battle was fought there in 1863.

Armstrong, John

Born: October 13, 1717 Died: March 9, 1795

English colonial surveyor and colonial militia officer. Born in Brookeborough, County Fermanagh, Ireland, on October 13, 1717,

John Armstrong apprenticed as a civil engineer and arrived in Pennsylvania as a surveyor for the proprietors of the colony. In 1750, he surveyed and laid out the town of Carlisle, Pennsylvania. Armstrong was also one of its first settlers.

Appointed a provincial lieutenant colonel at the beginning of the French and Indian War (1754-1763), Armstrong led an expedition of 300 militiamen against the strategically located Delaware settlement of Kittanning along the Allegheny River, roughly 25 miles north of French-held Fort Duquesne. Armstrong needed no prompting in this endeavor as his brother, Edward, had recently fallen victim to the Delawares.

The main target of the expedition was a Delaware chief called Captain Jacobs, who had sought a British alliance in vain and allegedly participated in the rout of Major General Edward Braddock's British forces in 1755. Attacking at dawn on September 8, 1756, Armstrong's party met formidable resistance and suffered 40 casualties at the hands of warriors who refused to surrender. With the defeat of the natives, Armstrong put the town of 30 cabins to the torch, which detonated gunpowder supplies and killed several noncombatants. Eleven captives were recovered and an equal number of Delawares slain, including Captain Jacobs, for whom a British reward had been posted.

This raid by Armstrong, who became known as the "hero of Kittanning," provided one of the few successes in an otherwise dismal year for Anglo-American fortunes. Indeed, English settlers suffered heavier losses along the Pennsylvania frontier in the ensuing months from Delaware counterattacks. In 1758, Armstrong joined British troops led by Brigadier General John Forbes, who forced the French to vacate and torch Fort Duquesne. During that expedition, he befriended Lieutenant Colonel George Washington. They remained lifelong friends.

Named a brigadier general in the Continental Army in March 1776, Armstrong was ordered to Charles Town (present-day Charleston, South Carolina), where he helped supervise construction of the defenses that withstood the British attack later that same year. Resigning his commission in the Continental Army in April 1777, Armstrong immediately was appointed a brigadier general in the Pennsylvania Militia, and in June he was made a major general. Militia under his command took part in the battles of Brandywine Creek and Germantown that autumn.

Armstrong continued his strong support of Washington and the Patriot war cause through his efforts in the Continental Congress, to which he was elected in November 1778. Armstrong served in that capacity until 1780 and later was a strong proponent of a new U.S. Constitution. He served in the Congress again during 1787–1788. Known as the "first citizen" of Carlisle, Pennsylvania, Armstrong died there on March 9, 1795.

Artillery, Land

During the colonial period, artillery underwent significant technological and organizational changes. Long a peripheral arm of European armies, artillery that fired projectiles by means of black powder became a full-fledged part of the battlefield, particularly during the 17th and 18th centuries.

Traditionally, the word "artillery" referred to any missile-throwing device. Weapons capable of firing large projectiles date to the *ballistae* of the ancient Greeks and *trebuchets* of Medieval England. The use of combustible material to launch a projectile, however, can be traced to the Arabian *madfaa* and the French *pot de fer* of the Middle Ages.

The 15th century witnessed the birth of the first modern cannon. Called *bombards*, these primitive guns were made of long, flat iron bars placed lengthwise and welded together on a mandrel in cylindrical fashion. The interstices were then filled with molten lead. Over this iron hoops were forced for added strength. The bombards were then mounted on a grooved, wheelless, wooden platform. Though some *bombards* were capable of firing stone balls up to 25 inches in diameter, these early artillery pieces possessed both limited range and power, were expensive to build, and proved difficult to move. As a result, European armies long viewed artillery as an ancillary weapon best used to either attack or defend forts.

Once gun barrels began to be solid cast in the late 1400s, artillery took a decisive step forward. The two metals most commonly used—iron and bronze—revealed their own respective strengths and weaknesses. Iron was far cheaper than bronze but was more likely to fracture; bronze (90 percent copper and 10 percent tin), being a softer metal and easier to work with, was less likely to burst. European nations continued to use both metals well into the 19th century.

By the middle 1500s, the armies of Europe developed an abundant array of artillery pieces. The size and calibers of guns varied widely. Furthermore, each nation referred to each of its own cannon by different names, such as a "serpentine," a "demicannon," or a "falcon."

Guns were of different types. Cannon were designed to project shot at great range and flat trajectory. Mortars were short pieces designed for high-angle fire; they proved particularly valuable firing over enemy earthworks and castle walls.

Another artillery piece, the swivel gun (also known as a *patarero*, a "stock-fowler," and a "murderer") was a small, breech-loading gun mounted atop fortress walls and also on the rails of smaller ships. Designed for antipersonnel fire at close range, swivel guns were common in the 17th century.

An artist's depiction of an artillery piece being moved forward during King George's War (1744–1748). (North Wind Picture Archives)

Eventually, European armies came to refer to cannon by the actual weight of their projectile (i.e., a "24-pounder," a "16-pounder," etc.). A number of these artillery pieces attained quite formidable size. The English culverin measured 11 feet long, possessed a 5-inch bore, and weighed two tons. Using a 12-pound powder charge, the culverin could hurl its 18-pound shot up to 5,000 yards. Such guns were not easily transported; some of the largest cannon required up to 40 horses to move.

Regardless of the size or caliber, artillery pieces required a laborious series of steps to be successfully loaded and fired. First, a measured amount of gunpowder was forced down the barrel with a rammer, followed by a small piece of cloth or wood wadding, and then the ball. After priming with small-grain powder a small vent on the top of the gun's breech (rear), the piece could then be fired by a match. The barrel was intermittently swabbed with a wet sponge to remove fouled powder (which frequently coated the inside of the barrel) and to extinguish any lingering sparks before the placement of the next round. Moreover, the cannon frequently needed to be repositioned because of recoil. While a well-trained artillery crew could sponge, load, and fire a light gun every five seconds or so, a much longer time would be required to "run up" the carriage after it had recoiled and re-lay it on its target. The average recoil of a light gun on firing was about 3.5 feet.

Cannon used a wide variety of projectiles. In the late 1400s, iron balls replaced handcut stone balls. The former type of projectile greatly reduced "windage," the difference between the diameter of the bore and the diameter of the projectile. Windage allowed propulsive gasses released by the burning powder to escape, thereby lessening both the speed and distance of a fired round.

Some of the more common projectiles included solid shot (round iron balls), chain shot (two solid shot attached by a short length of chain), and cross bar shot (a single, solid shot cut into two halves and joined with a straight iron bar). The latter two were especially used at sea to attack an enemy ship's spars and rigging. Two particular types of projectile notorious for their lethality against personnel at short range were grape and canister. Grape consisted of iron balls (usually nine) around a central spindle, held together by a canvas bag secured by twine and resembling a bunch of grapes. This broke apart on firing. Canister consisted of musket balls or simple scrap bits of metal in a canister that also broke apart on firing, and had the effect of a modern shotgun.

The emergence of artillery also witnessed a concomitant rise in interest in the science of gunnery. For centuries, such tasks as aiming a gun, determining how much powder to use, and calculating the point of impact of a projectile remained problematic. Gunnery was more akin to an art than a science. By the late 1500s, however, the first serious writings on gunnery appeared. Writers on the subject discussed topics like the effect of wind and the dynamics of shooting up (or down) hill. Yet not until 1742 did the first serious treatise on artillery ballistics appear, Benjamin Robins's pioneering New Principles of Gunnery. An English mathematician, Robins gauged velocity, calculated the striking energy of a fired round, and determined the impact of wind resistance. Robins argued for a reduction in both the length and weight of guns and also for elongated projectiles. He also invented the "ballistic pendulum," a device that measured the velocity of projectiles. Another important book on 18th-century artillery was Englishman John Muller's Treatise of Artillery (1757). Muller argued for lighter guns and for more scientific analysis in gun design and practice.

As a result of the rise of the science of gunnery, new emphasis was placed on accuracy. Instrumental to the process was the development of trunnions, large lugs cast on the sides of the gun barrel and at right angles to it. These additions allowed guns to be more easily leveled vertically. In addition, artillery pieces also appeared with a trail, a large heavy wooden projection leading rearward from the carriage to the ground that not only helped stabilize the gun, but, when raised, allowed the piece to be pulled by oxen or horses. Despite such improvements, however, many problems remained. Artillery lacked any type of accurate sighting or aiming mechanism other than sighting along the barrel, gunners could not fire on anything than they could not actually see, and projectiles tended to guide left or right depending on the quality of the barrel casting.

Artillery in North America consisted of a wide variety of guns, most of which were used for the defense of forts. The Spanish introduced the earliest cannon to the Western Hemisphere. Memories of attacking the walled cities of the Aztecs and the Incas convinced some of the viability of artillery against the indigenous peoples. For example, expeditions led by Hernando de Soto in Florida (1539), Francisco Vásquez de Coronado in northern Mexico (1540), and Juan de Oñate in New Mexico (1597–1598) possessed artillery. It was not until 1710, however, that the Spanish government officially

established artillery as a formal branch of its armed forces. Heavily influenced by the French, Spanish artillery consisted of a wide variety of guns, including 24-, 16-, 12-, and 8-pounders plus a 4-pounder field gun (*cañones de campaña*). By the 18th century, any significant Spanish artillery in the Americas remained concentrated in Florida, and most of these pieces were lost in the French and Indian War.

The French made significant contributions to the development of artillery. Beginning in the 1730s, the French were the first to standardize gun calibers and methods of cannon manufacture. Later, General Jean-Baptiste Gribeauval expanded on these reforms, introducing not only a comprehensive system that regulated the design of rolling stock (such as gun carriages and caissons), but created categories of field, siege, garrison, and seacoast artillery. The revolutionary "Gribeauval System," officially adopted by France in 1774, quickly spread to other European powers. The most noteworthy use of artillery by the French in North America in the 18th century proved to be the organization of Canonniers-Bombardiers, companies raised to defend Louisbourg, Saint Domingue, the Windward Islands, Canada, and Louisiana.

For the British and their American colonies, the use of artillery met a mixed reception. After the Restoration in 1660, the English Army neglected its heavy ordnance because of the expense and problems of maintaining the weapon in peacetime. Moreover, gunners were often civilians specifically hired for the purpose, and not professional soldiers.

Nevertheless, the English employed artillery from the very beginning of their exploration and settlement of North America. For example, the "Lost Colony" at Roanoke (1587) possessed several falcons and sakers, Jamestown (1607) wielded a number of guns, and the Pilgrims at Plymouth (1620) used artillery pieces removed from the *Mayflower*. In 1638, the Ancient and Honorable Artillery Company of Massachusetts was established. In the 18th century, heavier British artillery could be found at Fort Pitt, Fort Ticonderoga, and Castle William in Boston Harbor. Despite the size and intensity of imperial rivalries, artillery remained an ancillary combat arm in North America, and would not emerge as a singularly viable battlefield asset until the American War of Independence, beginning in 1775. In its field artillery, Britain usually used 3-, 6-, and 12-pounder guns.

One of artillery's greatest transformations occurred during the 18th century with the birth of "horse artillery." An improvement in casting techniques and a higher quality of powder allowed both smaller and lighter barrels. As a result, guns became more mobile. One individual who fully recognized the military potential of such a phenomenon was King Gustavus Adolphus of Sweden (r. 1611–1632). He not only distinguished between "field" and "siege" artillery (everything under or over a 12-pounder) but boldly used his artillery as an aggressive, front-line arm directly against enemy infantry. Though the effect of Adolphus's tactics proved revolutionary on the battlefield, his methods were soon forgotten. Rediscovered by Frederick the Great in the 1740s, horse artillery was quickly adopted by European armies by the end of the 18th century.

Artillery, Naval

Naval artillery followed much the same technological evolution as that on land. Using these often-unwieldy weapons at sea posed a series of unique and interesting challenges. Certainly the European powers employed cannon aboard ships in the second half of the 14th century. Most early guns at sea were small, averaging some 20 to 40 pounds in weight, and formed part of an arsenal that included such edged weapons as axes, swords, and cutlasses, as well as crossbows and bows and arrows.

The first cannon at sea were mounted to fire over the bulwarks (even today known as the gunwale). Undoubtedly, they were similar to the weapons on land and these short bombards served as an auxiliary weapon. Such early cannon might be loaded with "langridge" (scrap metal and small stones) to repel enemy boarders or assist one's own crew in a boarding attempt.

Eventually, cannon carried aboard ship increased in size, and with the advent of heavy guns at sea came the possibility of actually destroying an enemy ship by gunfire while limiting risk to both one's own ship and crew. Reportedly the first loss of a ship to naval gunfire came in 1513. Up to the mid-19th century and the advent of explosive shell, most ships in the age of fighting sail that sank at sea did so because of fire or the explosion of their magazines. Gunfire primarily served an antipersonnel function, enabling a ship to be taken by storm following the inflicting of heavy casualties among its crew.

Large ships could stand the heavier guns, and weight was not the factor that it was on land, at least for field artillery. At the end of the 15th century an important change occurred in the way guns were carried at sea. Up to that point the heaviest guns were mounted in the waist to fire over the bulwarks, whereas the lighter guns were in the castles fore and stern. The high castles designed to allow plunging fire by a variety of antipersonnel weapons against an enemy ship, however, made such warships unwieldy and top heavy, occasionally with disastrous result. New, heavier guns were mounted between decks and fired broadside out of holes cut in the sides of the ship, known as gun ports. The gun ports could be closed off in bad weather by means of lowering a lid over them. The largest guns were mounted on the lower decks. As cannon grew heavier and less numerous aboard a ship, the lines of warships changed, with a reduction in the

height of the castles and the advent of the relatively clean lines associated with ships of the age of fighting sail.

The early guns formed of wrought-iron bars welded together around a mandrel and secured by reinforcing rings were soon replaced by larger cast guns. Almost all were muzzle loaders. The breech-loading principle was retained only in the smallest mankilling guns set in the rails of the ship and known as swivels.

For some time bronze was the favored metal for cannon. Formed of 90 percent copper and 10 percent tin, it was both easier to cast and less likely to burst on discharge than iron. Iron guns, however, although heavier and more likely to burst in case of fracture, were far cheaper than those of bronze and by the end of the 18th century had become the predominant type aboard ship, where weight was not the consideration it was for field artillery.

Larger muzzleloaders were certainly not rapid fire weapons. According to one knowledgeable contemporary, the average for such guns in the mid-17th century was only about eight shots an hour. By the late 16th century, muzzle-loading cannon were divided into three broad categories of culverins, cannon, and perriers. Culverins were those around 30 bore-diameters (calibers) in length and had thick walls for long-range firing. Cannon were about 15–20 calibers in length. Usually 10-pounders or heavier, they were designed for medium-range fire. The shortest guns were the perriers (for stone thrower), usually 8–15 calibers in length, which included petards, howitzers, and mortars. Mortars evolved into very short weapons set in a fixed 45-degree mount and were by the end of the 17th century carried by special vessels, known as bombs or bomb vessels. They were used exclusively for shore bombardment.

Later, guns were denominated simply by the weight of the ball they fired. Thus a 12-pounder fired a ball weighing 12 pounds. The larger warships mounted the largest guns. In the late 17th century, the French *Soleil Royal* mounted a lower battery of 36-pounders. Most naval guns of the period were smaller. Dutch vessels of the 17th century, for example, rarely carried guns larger than 24-pounders. The largest guns in common use by the European navies at the end of the 18th century were 32-pounders.

The most common projectile fired at sea was solid round shot of iron. Round shot might also be heated in a furnace aboard ship and then fired at an enemy vessel. Such "hot shot" might actually set an opposing ship on fire. Other specialized projectiles included bar shot (a round shot split in half and joined by a single iron bar) and chain shot (two shot joined together with a chain). These rounds were used to attack spars and rigging. Grape shot was highly effective against boats or personnel. It consisted of iron balls, usually nine in number, positioned around a central spool and secured by a canvas bag bound with twine, the whole resembling a bunch of grapes. On firing, it broke apart. Canister shot was used at the closest ranges against personnel. It consisted of scrap metal or musket balls in a thin iron canister that also broke apart on firing and produced the effect of a modern shotgun.

A major problem employing artillery aboard ships was how to mount and secure the guns. Obviously, the rough and tumble of the

Early naval breechloading cannon. (Courtesy of Art-Tech)

ocean waves, coupled with the great recoil of the pieces during battle, required a sturdy mounting. Until the 1500s, guns were secured to simple wooden platforms, but these mountings were soon replaced by so-called truck carriages, which were heavy, wooden carts mounted atop four wheels known as trucks. By the late 15th century, cannon were cast with pivots, known as trunnions, along the side of the bore that supported the gun in its carriage. The carriage was secured by thick ropes (tackle) to the sides of the ship. The gun crew used tackle to help train the gun laterally and to return it to battery after discharge. Recoil was arrested by means of stout rope known as breeching. Truck carriages changed little in design and continued to be used into the mid-19th century.

Fleet actions consisted of warships in line-ahead formation blasting away at a similarly arranged enemy force, sometimes at dueling pistol range. In individual ship actions, the goal was to position one's own vessel perpendicular to an opponent so that all of one's own broadside guns could fire the length of the enemy vessel, whereas the latter could reply only with several guns at bow or stern. This was known as "raking" or "crossing the T."

Naval gunnery required great skill and physical stamina. The heavy guns might be worked by 10 or more men apiece. Since artillery came to constitute the primary method of both offensive and defensive operations for warships, everything depended on highly trained crews who could withstand the often terrible and destructive violence of naval battles and fire their own guns as rapidly as possible.

In battle virtually everything above the waterline proved vulnerable: sails, rigging, yards, masts, and, of course, the crews themselves. Wooden hulls could withstand considerable punishment and ships' carpenters could fairly easily patch holes at the waterline. Most ships taken at sea fell because of personnel losses that enabled them to be boarded and captured or from the crippling of the vessel through the loss of masts or rigging.

Artillery Projectiles

Although infantry engagements dominated colonial American warfare, both European regulars and colonists made use of artillery in siege operations and in the defense of fortifications and in naval combat. In this period there were four basic types of artillery projectiles: round shot, grape shot, exploding shell, and specialty projectiles for use by naval guns.

Round shot was simply a solid iron ball. Artillerymen of this era typically designated a cannon's size by the weight of the round shot it fired. For example, a 3-pounder field piece fired round shot that weighed approximately three pounds. During a siege, round shot was particularly useful in disabling enemy artillery. Gunners from a besieging army would attempt to position their guns so as to enfilade the parapet of the enemy fortification. They would then use ricochet fire—the bouncing of the cannonball down the length of the parapet—to dismantle or destroy guns and inflict casualties. Round shot could also be effective in battering the walls of a fortification and ships' hulls. In open warfare, round shot was a deadly antipersonnel weapon. When fired at a formation of soldiers, successive bounds of the projectile inflicted gruesome wounds from the ball itself and from the secondary projectiles—rocks, bone, or broken equipment—created with each impact of the shot.

Grape shot consisted of iron balls, usually nine in number, assembled around a spindle. The balls and spindle were then wrapped in canvas and netted tightly with cord, giving the appearance of a bunch of grapes. When fired, the bag blew apart and the balls scattered. Artillerymen employed grape shot against both personnel and boats.

Exploding shell were hollow, iron spheres filled with black powder and fired from howitzers or mortars. Gunners inserted timed fuses (hollow wooden cylinders filled with a slow burning compound) into the shell and at first either lit the fuse before firing the gun or later relied on the ignition of the propellant charge to light the fuse. To ensure the shell exploded on impact, artillerymen cut the fuse based on the estimated amount of time the shell would be in flight. Exploding shell were essential for the conduct of sieges and were used against personnel.

While solid shot and grape shot saw common use both on land and at sea, naval forces also employed chain and bar shot. These projectiles consisted of two solid shot connected by a section of chain or a bar. When fired, they spun through the air, destroying rigging and tearing sails. In addition, solid shot was often heated white hot in furnaces and then projected against a ship or a fort in the hopes of setting it on fire.

Throughout the colonial period, gunners also used other variants of these basic types of projectiles as well as field expedients based on the materials at hand and the type of target to be engaged.

Asiento

Agreement by Spain that allowed other countries to supply African slaves for the Spanish colonies in the New World. "Asiento" (also "assiento") means "treaty" or "agreement." The term was a common one in Spanish law referring to a trading agreement that granted a monopoly in a particular commodity. Although other slave trade monopolies were concluded earlier, including with the Portuguese and the French, the most famous or infamous asiento was that of March 16, 1713, with the British government.

The Asiento of 1713 was concluded between Spain and Britain following the War of the Spanish Succession (1702–1713). With the establishment of the Spanish Bourbon dynasty in 1700, a French company was established that secured the slave-trading monopoly for the Spanish colonies, but the British claimed and secured that concession in the Peace of Utrecht, negotiated in the spring of 1713. The asiento of March 16, 1713, gave Britain the right to introduce

into the Spanish colonies 144,000 African slaves at the rate of 4,800 per year for a 30-year period. The British also secured the right to sell British manufactured goods in one ship of 500 tons per year to Portobello in Panama and Veracruz in Mexico. The British government then conveyed this concession to the private South Sea Company, which had been formed in 1711.

This British concession helped form the basis for the financial speculation known as the South Sea Bubble. It also pried open access to the Spanish colonies for British goods and led to a brisk illicit trade. Disputes over the agreement and British smuggling led to increasing bitter recriminations between the British and Spanish governments and some violence and helped bring on the Anglo-Spanish War or War of Jenkins' Ear in 1739, which merged into the War of the Austrian Succession (1740–1748).

In the 1748 Treaty of Aix-la-Chapelle, which ended the War of the Austrian Succession, Spain agreed to let the asiento be renewed for the three years left under the agreement when war had begun, but increasing Spanish resentment led to the Treaty of El Retiro of October 5, 1750, whereby the South Sea Company gave up its claims in return for a payment of £100,000 from the Spanish government.

Atkin, Edmond

Born: February 27, 1697 Died: October 8, 1761

Colonial trader, politician, and superintendent of Indian Affairs for the southern colonies (1758–1761). Born in England on February 27, 1697, Edmund Atkin emigrated as a young man to South Carolina, where he became a prominent deerskin trader in Charles Town (present-day Charleston, South Carolina). In 1738, he began his career in politics when he was appointed to the upper house (Council) of South Carolina's assembly. In 1750, he led an inquiry into the roles of two English traders in a disastrous revolt by the Choctaws and their French allies. On completing the report, Atkin returned to England. There he established himself as an expert on Native American affairs.

While in England, Atkin wrote Historical Account of the Revolt of the Choctaw Indians in the Late War from the French to the British

44 Attakullakulla (Little Carpenter)

Alliance and of Their Return Since to That of the French (1753). This essay provided a historical account that pointed to problems in the implementation of England's policies toward the natives. It also foreshadowed his later approach to native relations.

When the French and Indian War (1754–1763) began, many British colonists and officials concluded that trade with the American Indians needed better regulation. Atkin and others recognized that the French advantage in obtaining native allies had to be broken. They concluded that native support on the battlefield could best be secured through trading allegiances. In 1755, Atkin wrote *Indians of the Southern Colonial Frontier*. In this extended essay, Atkin called for creation of a centralized native policy that could oppose the French and Spanish influences in the southeast. Such a policy, he asserted, would create a powerful alliance with the region's Native Americans.

Although appointed by the British Board of Trade in 1756 to serve as superintendent of Indian Affairs for the southern colonies in 1756, Atkin did not arrive in South Carolina to assume his post until 1758. As superintendent, he operated as a subordinate to the commander in chief of British forces in America, Major General Jeffery Amherst. Although colonial governments still had some influence over relations with Native American nations, the appointment of superintendents like Atkin significantly diminished the power that the English colonials had traditionally exercised.

In 1761, after a largely ineffective tenure in office, Atkin resigned and was replaced by John Stuart. Atkin died soon after on October 8, 1761, on his Mars Bluff Plantation near Florence, South Carolina.

Attakullakulla (Little Carpenter)

Born: ca. 1712 Died: ca. 1780–1785

Cherokee leader. Born some time around 1712 on Sevier Island in the French Broad River of Tennessee, Attakullakulla (also known as "Little Carpenter") became an important peace chief who shaped diplomatic relations between the Cherokees and the Europeans for more than 50 years. In his youth, he was one of seven Cherokees who traveled to London in 1730 to meet England's King George II. A leading peace chief by 1738, Attakullakulla was decidedly pro-British.

Captured by French-allied Ottawa warriors about 1740, Attakullakulla was held captive until 1748. On his return to the Overhill

Cherokees around 1750, he became the top lieutenant to his uncle Connecorte (Old Hop), the head chief of Chota and considered the Cherokees' best warrior.

In the 1750s and 1760s, Attakullakulla dominated the diplomatic scene. Although he usually favored the British, he was a consummate diplomat, always hoping for a peaceful resolution to problems but looking out for the best interests of the Cherokees. He negotiated with both French and English officials. He also curried favor among both the Virginians and South Carolinians as he negotiated advantageous trade relations. He championed the cause of increased military protection in the form of European forts, especially Fort Loudoun.

With the outbreak of the French and Indian War (1754–1763), Attakullakulla and other Cherokees fought alongside the British. The Cherokee Nation as a whole, however, remained divided, eventually leading to the Cherokee War (1759–1761). In 1759, Gov. William Henry Lyttleton of South Carolina took a Cherokee delegation hostage, including the great war chief Oconostota. Attakullakulla successfully negotiated Oconostota's release, but the remaining hostages were killed. As a result, the Cherokees besieged Fort Loudoun and cut off all supplies.

Attakullakulla attempted to negotiate and prevent the escalation of violence. When he was unsuccessful, he warned the English of an impending attack and eventually ransomed Lieutenant John Stuart, helping him escape to Virginia. He and Colonel James Grant negotiated peace for the Cherokees in 1761. Attakullakulla was also part of the larger peace process again in 1763 when the French and Indian War ended.

Attakullakulla remained active in diplomatic affairs through the 1770s. He unsuccessfully argued against the 1776 Cherokee attack on the southern colonies and helped to negotiate the 1777 Treaty at Long Island on the Holston with the Patriot side, which ended the ensuing war. He lost prominence, however, as a large faction of Cherokees under his son, Dragging Canoe, continued fighting the Americans. Attakullakulla died sometime between 1780 and 1785 at an unknown location.

Augusta (Georgia)

Settlement at the falls of the Savannah River in Georgia, created by the order of Georgia's Gov. James Oglethorpe on June 14, 1736. Augusta became a center of the Anglo-native deerskin trade from 1737 to 1775. Taking advantage of water routes to Charles Town, South Carolina (present-day Charleston), and Savannah, Georgia, the falls of the Savannah had been a trading outpost since 1715, centered at South Carolina's Fort Moore and the nearby town of New Windsor. In 1736, James Oglethorpe, hoping to divert the profits of the deerskin trade to his new colony of Georgia, ordered a town and fort for the Georgia side of the falls, naming both Augusta in honor of the Princess of Wales.

Offering generous land grants, Oglethorpe hoped to lure Carolina traders to his colony and support the struggling town of Savannah with profits from deerskin exports. In some ways, the plan worked, as native traders from New Windsor relocated across the river, but their deerskins still went to Charles Town for export and the older colony's influence over Anglo-native relations was never threatened by Georgia.

The town of Augusta quickly became the major center of the Anglo-native deerskin trade. Each year, traders from native villages went to the town to settle their accounts with the leading storekeepers and to exchange the previous winter deerskins for a fresh supply of trading goods. The wealth generated from the trade was centered in Augusta's leading merchant firms, including Brown, Rae, and Company and Macartan and Campbell. The former was by far the most powerful and influential trading house in the southeast, as its members included such prominent traders as Patrick Brown, John Rae, George Galphin, and Lachlan McGillivray. These men likewise enjoyed sizable landholdings worked by slaves purchased from Charles Town, and they dominated Augusta society, serving as justices of the peace, captains of the local militia, and members of the Georgia Assembly. The storekeepers' fortified homes also served as military refuges for the local white population during times of crisis.

Most important, however, was the influence of Augusta on Anglo-native relations in the southeast, particularly between the British colonies and the Creek confederacy. The traders' familiarity with Native American politics and language earned them a central role as informants and interpreters. The fact that many of them had married Native American women also gave them a powerful voice in native towns, and it was largely their influence that convinced the Creeks to cede large land parcels to Britain in two treaties signed at Augusta in 1763 and 1773.

While royal governors and native agents mistrusted the traders' motives, so long as the trade was centered in Augusta their influence was profound. Only with the beginning of the American Revolutionary War did the Augusta deerskin trade finally die out, replaced by a new generation of cotton planters and merchants.

Augusta, Congress of

Start Date: November 3, 1763 End Date: November 10, 1763

General congress among the governors of the four southernmost colonies and the leaders of the five major southeastern Native American confederacies in Augusta, Georgia, held during November 3–10, 1763. The royal governors of the four southern British colonies (Francis Fauquier of Virginia, Arthur Dobbs of North Carolina, Thomas Boone of South Carolina, and James Wright of Georgia) joined John Stuart, the British superintendent of Indian Affairs for the southern region to meet with Native American representatives for the Catawbas, Cherokees, Creeks, Chickasaws, and Choctaws. The native delegation totaled more than 900 people. The Congress's main goals were to repair Anglo-native relations after the French and Indian War (1754–1763), settle grievances over the deerskin trade, and to establish a firm boundary between white settlements and Native American hunting grounds. The treaty signed on November 10 mostly unified various prior agreements made separately between the governors and natives, with one important exception. The Creeks, for the first time since 1733, ceded territory to Georgia in exchange for an enforceable boundary.

Land cessions and a peaceful southeast were priorities for the British government in 1763. Having exhausted the coffers in winning eastern North America from France and Spain, Britain soon found itself fighting Chief Pontiac's Rebellion (1763) in the Ohio Valley and Great Lakes region. Recognizing that anti-English sentiment still lingered among southern tribes, the royal government ordered the governors to call a general meeting and prevent a southern expansion of the native uprising. Fauquier, Dobbs, and Boone attended out of obligation to the royal government, but felt little pressing need to do so, as their colonies had largely settled native affairs in separate treaties during the last days of the French and Indian War.

The same was true for many of the Native American delegates. The Catawbas and Cherokees used the congress to raise longstanding complaints of trader abuse and white encroachment, but little new came from the talks. The Chickasaws, staunch British allies and far removed from the irritation of British settlers, made few demands. The Choctaws, at war with the Creeks, believed the journey too dangerous and sent but two representatives. Despite the congress's goal of universality, its main significance lay in the particulars of Georgia-Creek relations.

For Georgia's Wright, the congress was crucial. For many of the Creeks, avoiding the congress was equally important. Anglo-Creek relations had been strained by the war with France, fueled by Creek fears that the British wanted to seize all their lands. Word had quickly spread in advance of the congress that the British wanted

to purchase Creek lands in Georgia, giving new life to old fears. A month before the congress, these tensions increased as Creek warriors killed a number of Georgia traders. Wright, whose young and sparsely populated colony would bear the brunt of an Anglo-Creek war, eagerly sought to ease tensions, convincing the governors to move the congress from Charles Town (present-day Charleston, South Carolina) to Augusta to assuage Creek concerns. Even with this concession, few Upper Creeks (among whom anti-British feeling ran deepest) attended, and none of their most influential leaders went. The Lower Creeks were ultimately persuaded to attend and to cede lands by the influence of the respected traders Lachlan McGillivray and George Galphin. At the congress they allowed Georgia's territory to increase dramatically from the original seacoast grants made in 1733, giving Georgia its first true native boundary. The Upper Creeks disagreed with the cession, but ultimately ratified it a year later.

For the Creeks, the Augusta Congress was the major turning point in their relations with the British. Their decades-old policy of neutrality was unsustainable without European rivals competing for their affections and they now found themselves encircled by a British government constantly demanding land cessions, a process that would continue under the U.S. government until the era of removal beginning in the 1830s.

Ayllón, Lucas Vázquez de

Born: ca. 1480

Died: October 18, 1526

Spanish explorer, wealthy planter, and founder of San Miguel de Gualdape, the first European settlement in the present-day United States. Born in Toledo, Spain, about 1480, Lucas de Vázquez Ayllón led an obscure early life until he immigrated to Santa Domingo, Hispaniola, in 1502. There he made his living as a judge and a sugar planter. In 1521, he employed Francisco Gordillo to travel to the Florida mainland for exploratory purposes. Gordillo's reports indicated that the land of Chicora (along the coast of South

Carolina and Georgia) had abundant natural resources and a mild climate resembling that of Spain. This information led Ayllón to believe that a European settlement in the area could thrive, both as a trading center and as a missionary town to the natives. In mid-July 1526, Ayllón set sail to the north and west with six ships and about 600 people, including several women and slaves, to establish the first European settlement in the present-day United States: San Miguel de Gualdape.

The group spent some time exploring before settling on the site for the new colony in September 1526, most likely on the 29th, the feast of Archangels. The exact location of the colony is unknown, with various theories suggesting Cape Fear, North Carolina; Winyah Bay, South Carolina; and Sapelo Sound, Georgia. More recent information supports the southernmost location of Georgia, but concrete archaeological evidence has yet to be found.

The fledgling colony faced serious hardships almost immediately, including problems with supplies, abandonment by their native interpreters, starvation, disease, and hostility from the natives. Many of the colonists could not survive under such conditions, including Ayllón himself, who died on October 18, 1526. During the winter, the colonists bore more hardships and faced a mutiny. In the spring, the remaining 150 survivors abandoned the colony and returned to Hispaniola.

Ayubale (Florida)

Spanish mission of the Apalachee Indians, also called *Nuestra Señora de la Concepción de Ayubale* (Our Lady of the Conception of Ayubale) and site of Carolina governor James Moore's first invasion of Apalachee missions. Ayubale was situated in Spanish Florida's eastern Apalachee Province, east of modern-day Tallahassee.

During Queen Anne's War, following his expensive but unsuccessful 1702 siege of St. Augustine and his loss of the governorship in 1703, James Moore recruited 50 Carolinians and 1,000 Creek Indians to attack the Apalachee missions in January 1704. Denied support by the colony, the expedition covered its expenses (and more) through plunder and the sale of captured mission Indians into slavery. Ayubale was the first mission struck, which fell quickly after the burning of the adjacent town. Two dozen Indians were killed, and the Carolinians and the Creeks each took about 200 captives. Captain Juan Ruíz Mexía led a relief force of 30 Spaniards and 400 hastily armed Apalachee from San Luís in a counterattack at

Ayubale, but he failed and lost nearly half of his men. This constituted the only resistance that Moore encountered. The inhabitants of five other Apalachee towns either surrendered or migrated to Carolina to live among the Creeks. San Luís was not attacked.

The expedition returned to Carolina with some 1,400 Apalachee slaves. Survivors fled east to St. Augustine and west to the French settlement at Mobile. After this and subsequent raids, Apalachee country was largely abandoned. Moore later asserted that the operation had secured Carolina from overland attack.

B

Bacon, Nathaniel, Jr.

Born: ca. 1646–1647 Died: October 26, 1676

Leader of the rebellion that bears his name and that engulfed the English colony of Virginia during 1676–1677. Nathaniel Bacon Jr. was born in England, probably in 1646 or 1647. He studied at Gray's Inn in London. In financial difficulties for living beyond his means, Bacon emigrated to Virginia in 1674. There he was welcomed by his cousin, also named Nathaniel Bacon, a member of the provincial council and wealthy tobacco planter. The elder Bacon helped him purchase a plantation located about 50 miles up the James River from Jamestown. He also prevailed on the royal governor, Sir William Berkeley, to name Bacon to the council, an extraordinary appointment for a recent arrival, but young Bacon was actually related to Berkeley by marriage.

Bacon seems to have been an inveterate schemer and trouble-maker. He soon joined with wealthy Virginia planter William Byrd and others in a trading venture with Native Americans. When the Susquehannocks raided the northwestern Virginia frontier, Bacon took the lead among frontier settlers in demanding that Berkeley mount a major reprisal. The governor refused, preferring instead a conciliatory approach toward the natives lest his own interest in the fur trade be damaged.

Bacon became the leader of a movement that opposed Berkeley's Native American policy in hopes that strong action would enable the settlers to take the native lands. Indeed, Bacon headed a group that drove Pumunkey Native Americans from their ancestral holdings. This action caused Berkeley to ride to Henrico with 300 armed followers, whereupon Bacon and 200 of his men fled into the

English colonist Nathaniel Bacon, who in 1676 led a revolt of colonial Virginia's frontier settlers against Virginia governor William Berkeley. (Library of Congress)

forest. Berkeley declared Bacon an outlaw but promised him a trial. At the same time Berkeley pardoned Bacon's men on the condition that they return home.

Bacon's response was to lead an attack on the friendly Occaneechees along the Roanoke River between Virginia and North Carolina. To prevent civil war, Berkeley offered to pardon Bacon on condition that he return to England to be tried before King Charles II. The House of Burgesses rejected this solution, demanding instead that Bacon publicly apologize for his actions and seek the governor's forgiveness. Ironically, Bacon's neighbors, who supported his harsh stance against Native Americans, elected him to the House of Burgesses for the next session, which opened in June 1676.

On his arrival in Jamestown for the meeting, Bacon was arrested and taken before Berkeley and the Governor's Council, where he was forced to apologize. Berkeley then pardoned him and allowed him to take his seat in the House of Burgesses. In the ensuing debate over Native American policy, Bacon left the assembly in anger and returned with armed supporters. They surrounded the state house and forced Berkeley to appoint Bacon as commander of a militia force to launch attacks on the Indians.

For the next three months, Bacon was in firm control of Jamestown. Although he mistakenly allowed Berkeley to depart Jamestown, he was initially strong enough to prevent Berkeley's attempt to overthrow him. Consequently, Berkeley fled to Accomack County on the Eastern Shore. Meanwhile, Bacon issued his famous Declaration of the People on July 30, 1676, denouncing Berkeley for corruption and playing favorites. He overplayed his hand, however, by requiring Virginians to take a personal oath of loyalty to him. When Berkeley supporters succeeded in infiltrating Jamestown and seizing control of the town and the colony's ships, Bacon retaliated by burning Jamestown to the ground on September 19. By that date public opinion had turned solidly against him. Bacon died on October 26, 1676, of the "Bloodie Flux" (fever) and "Lousey Disease" (body lice). His contaminated body, never found, was probably burned by his own men. On Bacon's death, Berkeley regained full control of Virginia affairs.

Bacon's Rebellion

Start Date: June 1676 End Date: January 1677

A violent uprising in Virginia led by Nathaniel Bacon, a member of the rural planter class. At one time identified as the first manifestation of revolutionary sentiment in English North America, Bacon's Rebellion is now seen as more the result of a power struggle between two colonial leaders. A number of factors contributed to the unrest, chief among them a declining economy brought on by a sharp drop in the price of tobacco, the result of increasing competition from Maryland and the Carolinas. This economic crisis affected small farmers and planters alike, and many Virginia farmers relied almost exclusively on tobacco cultivation. The ongoing Anglo-Dutch wars also wrought considerable havoc, disrupting trade and increasing the price of imported English manufactured goods. A series of natural disasters had also taken a heavy toll. These included hurricanes, dry spells, and hailstorms.

Internal Virginia politics played the key factor in the outbreak of the rebellion. In an effort to expand their land holding, the colonials increasingly encroached onto Native American lands in the western part of the colony, leading to armed conflict. The natives found themselves a ready scapegoat for the colony's other problems.

In July 1675, apparently in a dispute over nonpayment of trade items, members of the Doeg tribe raided the plantation belonging to Thomas Mathews near the Potomac River in the Northern Neck area of Virginia. Several Doegs were killed in the raid. Unfortunately, the colonists then mounted a retaliatory strike against the wrong tribe, the Susquehannocks, and this led to a series of native raids along the western frontier.

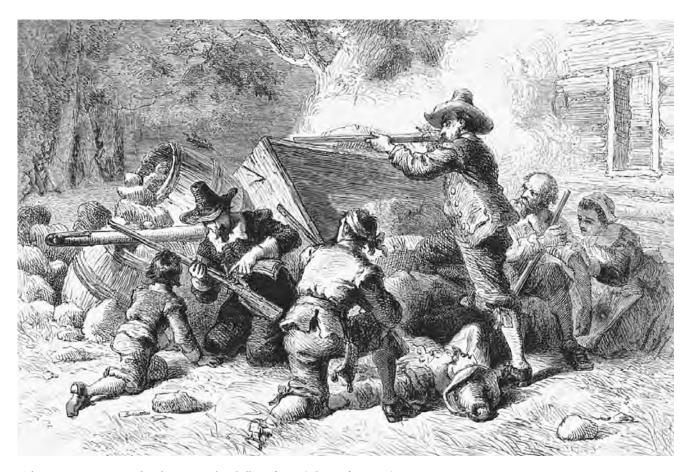

In the hopes of preventing a spread in hostilities, Virginia governor Sir William Berkeley ordered an investigation. This led to a meeting between the two sides and the murder of several chiefs. Throughout the crises, Berkeley sought to please both sides, leading to anger on the part of many western colonists, who believed the government had abandoned them in the face of the native threat.

The leader of the western colonists was the intemperate yet eloquent Nathaniel Bacon, distant relative of Berkeley and a member of the House of Burgesses since 1675. Bacon opposed Berkeley's conciliatory policies and disregarded a direct government order by seizing some members of the Appomattox tribe for allegedly stealing corn, whereupon Berkeley reprimanded him. In the western part of the colony, probably a majority of the colonists sided with Bacon, believing that Berkeley was taking the natives' side.

Berkeley sought to pursue a middle course, ordering local natives to give up their powder and ammunition while, in March 1676, calling the "Long Assembly."

This body declared war on hostile Native Americans and took steps to strengthen the Virginia frontier defenses. But this action also necessitated a sharp increase in taxes. The assembly also took charge of trading with the natives, insisting that this be done through a government commission, supposedly to see that the natives were not receiving arms and ammunition, but the commission also brought financial gain to close associates of the governor.

Bacon was one of those who had traded with the natives and was adversely affected by this decision. In addition, he was angry because Berkeley had denied him a commission as militia officer. Bacon then secured his election as the "general" of a local militia, promising to pay for its operations against the natives from his own pocket.

Fighting among Virginia settlers during Bacon's Rebellion of 1676. (Library of Congress)

When Bacon and his men drove a number of friendly Pamunkeys from their lands, Berkeley rode to Bacon's headquarters at Henrico with a force of 300 well-armed men to confront him, whereupon Bacon and his 200 men fled into the forest. Berkeley then issued two decrees, the first declaring Bacon a rebel and the second pardoning his men if they would return to their homes. Bacon would lose his seat on the council, to which he had won election that year, but Berkeley promised him a fair trial. Bacon failed to comply with Berkeley's order. Instead he led an attack on the friendly Occaneechee natives along the Roanoke River, the border between Virginia and North Carolina, seizing their stocks of beaver pelts in the process.

With events now seemingly spinning out of control, Berkeley announced that he was ready to forgive Bacon's disobedience and pardon him if he agreed to be sent to England for trial there before King Charles II. The House of Burgesses, however, insisted that Bacon apologize and ask for the governor's forgiveness. At the same time, supported by the western landowners who approved of his actions toward the natives, Bacon won election to the House of Burgesses.

In June 1676 Bacon traveled to Jamestown to take part in the new assembly. Bacon has been mistakenly credited at the time for a number of political reforms enacted by this assembly, including

granting freedmen the right to vote and limiting the terms of officeholders. Bacon's only real platform, however, was his opposition to Native Americans.

On his arrival at Jamestown, Bacon was arrested and taken before Berkeley and the crown council, where he apologized for his actions. Berkeley then pardoned Bacon and allowed him to take his seat. Neither Berkeley nor the council understood the level of support that Bacon enjoyed. That became clear when in the midst of debate over Native American policies, Bacon stalked out of the meeting and left Jamestown, only to return a few days later with some 500 armed followers, who then surrounded the assembly house.

Bacon then confronted Berkeley and demanded he be placed in charge of all the colony's forces against the natives. Berkeley courageously refused this demand, made at gunpoint, offering to grant Bacon his previous militia commission but not control of the Virginia forces. With some of Bacon's men threatening to shoot members of the House of Burgesses, Berkeley at length gave in and granted Bacon's request that he be made "general" and commander of the Virginia Militia to lead it, free of government interference, in a campaign against the natives.

For the next three months Bacon was in firm control of Jamestown and on July 30 issued his "Declaration of the People,"

claiming that Berkeley was corrupt and had shaped his native policies in order to bring financial reward to himself and his friends. Bacon also issued a decree requiring an oath in which the swearer would have to agree to obey him in any manner Bacon deemed necessary. Berkeley, meanwhile, fled to his estate of Green Spring on the Eastern Shore and once again declared Bacon a rebel. Much to his dismay, the governor found he could attract few armed supporters. Indeed, many Virginians were upset with Berkeley for turning on Bacon in the middle of a campaign against Native Americans.

Bacon used his authority as commander of the militia to lead a force of about 1,000 colonists against the Native Americans, not to the western part of the colony, where the threat actually lay, but against the peaceful Pamunkeys, who had been friendly with the English since 1646. The colonists drove the Pamunkeys into Dragon Swamp, pursuing them over a three-week span and killing or capturing only 10, 7 of them women and children. Bacon then dismissed most of his force and pressed on with only about 150 of his most loyal followers. Shortly thereafter, they came across a Pamunkey camp, where they killed 53 natives, most of them women and children. Bacon declared the campaign at an end. In none of his fighting against the Native Americans did Bacon do battle with those who were actually hostile.

Bacon emerged from the campaign to learn that Berkeley's followers had infiltrated the ships of the Virginia navy enabling his return to Jamestown. Bacon then marched on Jamestown, besieging it. On September 16, the loyalists briefly sallied from Jamestown and attacked Bacon's siege positions, only to be driven back with a dozen casualties. Berkeley departed again with his followers for the Eastern Shore.

Bacon now overreached. On September 19, he ordered Jamestown, the oldest permanent English settlement in the New World, burned to the ground, although he did save most of the valuable state records. This deed led many Virginians to question their support for Bacon, who lost other followers by admitting to his military both indentured servants and slaves. This decision threatened to overturn the entire social order of the colony.

On October 26, 1676, Bacon died abruptly of "Bloodie Flux," a fever accompanied by virulent dysentery, probably a direct result of the time spent in the back woods and swamps. An obscure follower, Joseph Ingram, took over for him and the rebellion turned from its chief raison d'être of warfare against hostile Native Americans to mere looting and robbery.

Gradually Berkeley's forces grew in strength. They controlled the waters and, aided by the addition of several larger merchant vessels that they intercepted on arrival from England, mounted increasing numbers of raids up the James River and York River against rebel strongholds. Resistance strengthened before the chief rebel stronghold of West Point, whereupon Berkeley authorized Thomas Grantham, captain of the merchantman *Concord* to negotiate the surrender of the remaining rebels. There Grantham secured the surrender of some 700 freemen, servants, and slaves in January 1677. Bacon's Rebellion was for all intents and purposes at an end.

In the spring of 1677 at Middle Plantation, the Virginia government entered into a number of peace treaties with the natives in an effort to try to repair relations (the Susquehannocks apparently left western Virginia in mid-1676). Charles II had reacted to news of the rebellion by recalling Berkeley and dispatching a force of 1,000 soldiers, who, however, arrived after the rebellion was over. The first regular British troops to be stationed in Virginia, they were soon withdrawn. Bacon's Rebellion was in no way a precursor of the American Revolutionary War.

Balize Post (Louisiana)

French fortification and post built between 1721 and 1723 at the mouth of Southeast Pass, one of the entrances to the Mississippi River through the delta south of New Orleans. Balize Post was also known as Fort de la Balise. The site derived its name from *balise*, French for "beacon" or "channel buoy," because the French had installed a channel marker there to facilitate navigation of the river. The small settlement was situated on Toulouse Island.

The island was flat and about half a mile in circumference, forcing the French to build a 96-foot levee to protect the post from tides and floods. The levee also helped to protect the channel from erosion and provided important channel markers. The French stationed pilots and lighters at the post to assist vessels traveling upriver.

The location of these fortifications played an important part in the decision to make New Orleans the new capital of Louisiana, which the French did in 1722 on completion of the fort. Defenses included a 14-gun battery, a powder magazine, and storehouses. The post also boasted eight barracks, a forge, a bakery, a kitchen, and a church for the garrison of 50 soldiers and the pilots and sailors who lived there.

The location of Balize Post made it prone to damage from hurricanes, however. The fortifications had to be repaired in 1742 and again in 1749 after extensive flooding. In 1750, a hurricane destroyed the post, and the French abandoned the site. After Spain took control of the area in 1763, Spanish governor Francisco de Carondelet built a new fort at Balize Post after Fort Isla Real Católica

de San Carlos was abandoned in 1770 due to constant flooding. The Spanish renamed the post Fort la Baliza, which now included barracks, a hospital, a church, and a governor's house. Fort la Baliza was destroyed in 1778. Another post was built the same year, but the Spanish abandoned it as well because of constant flooding. In 1794, the Spanish erected a blockhouse and barracks on the site, which were taken over by the Americans in 1803. They named it Port at Balize and rebuilt the fort several times. During the War of 1812, the British occupied the post. The area became the site of a lighthouse for a number of years before being swamped and destroyed by a hurricane on September 13, 1865.

Barnwell, John

Born: ca. 1671 Died: June 1724

South Carolina colonist and soldier who gained notoriety for his actions in the Tuscarora War (1711–1713) and the Yamasee War (1715–1717). John Barnwell was born in Ireland around 1671. He became active in Carolina politics following his emigration there in 1701.

When hostilities broke out between expanding colonists and the Tuscaroras in North Carolina in 1711, Barnwell and the South Carolina Assembly pledged money and troops to help defend their neighbor. The Tuscarora War began in mid-September 1711 with the execution of North Carolina trader John Lawson by the Tuscaroras. On September 22, many displaced native tribes banded together to attack the expansionistic colonists, the largest contingent among them the Tuscaroras. In less than two hours, the natives killed more than 100 settlers, and by some accounts, closer to 200. Facing a full-blown war, North Carolina turned to South Carolina for help.

South Carolina responded by dispatching Colonel Barnwell and some 30 other officers heading up 500 troops. Most were Yamasee warriors. Barnwell's forces arrived near New Bern, North Carolina, in late January 1712 and engaged the natives in various skirmishes through April. Foremost among these was Barnwell's victory at the Native American village of Narhantes. However, the fighting culminated in the siege of Fort Hancock, upriver from New Bern, which fell to Barnwell's men on April 17. The Tuscaroras then negotiated a temporary peace, and Barnwell returned home.

Fighting resumed in the fall of 1712, but Barnwell was not involved. The final English victory was secured by James Moore's

expedition of 1712–1713, which culminated with the March 23 capture of Fort Neoheroka. Many of the Tuscaroras were thereby killed, enslaved, or dispersed. Some settled on reservations in North Carolina, while a large contingent relocated to New York and became part of the Iroquois Confederation.

When the Yamasee War began between South Carolina and the local Yamasee natives, Barnwell's fighting skills were again called on. For his help, South Carolina granted him 1,000 acres on the northwest corner of Hilton Head Island, South Carolina, in 1717. Barnwell subsequently became a prominent settler of Beaufort, South Carolina, some 20 miles north of the island.

As South Carolina continued its expansion, the border between the English colony and Spanish Florida became hotly contested. As a result, South Carolina hoped to establish a ring of forts on the outermost boundaries to support its claims. To that end, in 1721, Barnwell oversaw the construction of Fort King George at the mouth of the Altamaha River (near present-day Darien) on the ruins of a 17th-century Spanish mission. The post included a three-story blockhouse, barracks, and a palisade. This offered South Carolinians about 65 miles of buffer protection, as the boundary of their colony ended at the Savannah River. Fort King George was the southernmost point of the English empire in North America from 1721 to 1736. It was nevertheless garrisoned only by a small and weak force and saw very little action.

After a brief trip to England in 1722 as an agent for the colony of South Carolina, Barnwell died, probably in June 1724, in Beaufort. He is buried at St. Helena's Episcopal Church in downtown Beaufort.

Barnwell Township System

Plan to bolster the defenses of South Carolina's southern and western frontiers through the establishment of a string of compact settlements, modeled after New England frontier defenses. The system was originally proposed in 1720 by Colonel John Barnwell, a veteran of the Tuscarora and Yamasee wars, and later implemented by Gov. Robert Johnson.

Carolina had long relied on the Yamasee Indians as a buffer against hostile incursions from the south and west. The Yamasee War of 1715–1717 removed that option, however, leaving the plantations on the coastal plain exposed and vulnerable to attack. The legislature ordered the confiscation of Yamasee lands for the establishment of immigrant homesteads, but the Carolina proprietors

intervened and reserved the Yamasee lands for themselves. Further action was delayed by a rebellion against the proprietors and a lengthy transition to royal government.

Johnson, the colony's first royal governor, revived the plan in 1730 with the added purposes of offsetting the growing population of African slaves and creating a buffer between the slave and Native American populations to prevent their allying with each other. The Board of Trade approved a proposal for 11 townships, about 60 miles inland along major rivers from the Waccamaw River to the Altamaha River, that is, between the coastal plain and the Piedmont region. Two of the sites soon became part of the new colony of Georgia.

The colony established a fund to recruit poor European Protestants to settle the townships, although much of the money was diverted to pay off colonial debts. Each immigrant family received 50 acres of outlying farmland per family member plus one town lot. Scots-Irish, Swiss-German, Welsh, and other settlers were subsequently brought to the colony. The result was not a flood of immigration but the beginnings of a new "backcountry" society had been planted. Ten settlements were established by 1759, and three more were added farther inland in the 1760s. By 1760, the region contained about half of South Carolina's white population.

Bars Fight

Event Date: August 25, 1746

Abenaki attack on Deerfield, Massachusetts. During King George's War (1744–1748), on August 20, 1746, French soldiers under the command of Pierre François de Rigaud, Chevalier de Vaudreuil, and their Abenaki allies took Fort Massachusetts, about 30 miles west of Deerfield. After the capitulation, Rigaud sent 60 Indians to cut off the British reinforcement expected from Deerfield. Most of these British soldiers were shot down; the rest were captured.

The Abenakis continued as far as Deerfield, and on August 25 they reconnoitered the town's meadows. They then concealed themselves along the edge of a meadow south of the village, known as the Bars, where several men and children were putting up hay. The members of the haymaking group were Samuel Allen and his children Eunice, Caleb, and Samuel Jr., and two neighbors, Oliver and Samuel Amsden. Two armed soldiers, Adonijah Gillett and John Saddler, accompanied them for protection. Another citizen of

Deerfield, Eleazer Hawks, was out hunting partridges on the hills. When Hawks came close to the warriors and shot a bird, the Indians believed they had been discovered and killed and scalped him.

This development alarmed the field hands, who ran toward a mill on a brook that entered Deerfield River. Allen Sr., Oliver Amsden, and the two soldiers fired on the pursuers, trying to give the children an opportunity to escape. The elder Allen, Oliver Amsden, and Gillet were killed, but both Saddler and Caleb Allen escaped unhurt. Nine-year-old Samuel Amsden was caught and scalped. Eunice Allen was seriously wounded by a tomahawk blow to the head and left for dead. Her eight-year-old brother, Samuel Jr., was taken prisoner by the Abenakis and lived for 18 months with the tribe in Canada. He was finally redeemed by his uncle but resisted leaving the tribe and was taken back only by force.

Lucy Terry Prince (ca. 1730–ca. 1821), a freed slave who lived in Deerfield at the time of the attack and the earliest known African American poet, composed the poem "Bars Fight" soon after the event, although it was not printed until 1855.

Bars Fight

Seventeen hundred forty-six The Indians did in ambush lay Some very valiant men to slay The names of whom I'll not leave out Samuel Allen like a hero fout And though he was so brave and bold His face no more shall we behold. Eleazer Hawks was killed outright Before he had time to fight Before he did the Indians see Was shot and killed immediately. Oliver Amsden he was slain Which caused his friends much grief and pain. Samuel Amsden they found dead Not many rods off from his head. Adonijah Gillet we do hear Did lose his life which was so dear. John Saddler fled across the water And so escaped the dreadful slaughter. Eunice Allen see the Indians comeing And hoped to save herself by running And had not her petticoats stopt her The awful creatures had not cotched her And tommyhawked her on the head And left her on the ground for dead. Young Samuel Allen, Oh! lack a-day Was taken and carried to Canada.

Bateau

A flat-bottomed, shallow-draft boat, wide in the middle, with tapering ends. The bateau (plural: bateaux) was imported from Europe and adapted for use along the waterways of North America. Because of their shallow draft, bateaux had the ability to make many of the inland waterways navigable that otherwise would have remained inaccessible to deeper-draft ships. Bateaux came in a variety of sizes and were used in a number of different capacities both military and civilian.

As the name implies, they were of French invention, though the British and colonists built bateaux as well. Their long, narrow configuration gave them a rectangular shape that narrowed at the ends. They came in several types, based on their size. Most were between 24 and 30 feet in length, though some reached as long as 40 feet. During the French and Indian War, John Campbell, Lord Loudoun, tried to standardize the size of the bateaux used for transporting the supplies of the British Army and provincial troops. It is not clear that he succeeded in this enterprise.

Propulsion was mainly by paddle, with an additional paddle serving as rudder. Only two men were needed to guide the bateau when under oar. Bateaux used sails on occasion, fashioned from tents or blankets during desperate situations. When in shallow bodies of water, bateaux were most often poled.

Different types of bateaux were designated by their place of manufacture. Among these was the Albany-style bateau, which was somewhat smaller than the Schenectady-style. Bateaux served as an all-purpose cargo carrier, with some reaching a carrying capacity of over two tons. More commonly, they were capable of carrying a load of about 1,500 pounds. Bateaux were used as personnel transports as well.

As for their military uses, bateaux allowed for much faster movement of troops than would have been possible overland. They were, therefore, often pressed into service for the transportation of troops and supplies on the rivers and lakes of New York. They were predominantly used on the Hudson River and Lake George and Lake Champlain. Bateaux were, however, used throughout North America wherever the waterways made the use of such craft advantageous. In this role, they provided key support for logistics during the various campaigns of the colonial wars, beginning with King William's War (1689–1697), and were being used as military transports as late as the War of 1812.

Bay of Fundy Expedition

Start Date: May 23, 1755 End Date: Late June 1755

British campaign of 1755 against the French and Acadians in maritime Canada, part of the ongoing French and Indian War (1754–1763). Under Article XII of the Treaty of Utrecht (1713), Britain was to have taken possession of the territory of Acadia "within its ancient limits." As late as 1749, however, these limits remained unsettled, and "Acadia" was defined as everything from the modern territories of Nova Scotia and New Brunswick to a narrow coastal strip on the eastern side of the Chignecto Peninsula. The former reflected British land claims in the former French territory; the latter represented both French claims and the actual settlement patterns on the ground.

In the early 1750s, the French strengthened their claims, and not just by stalling British efforts to negotiate a new boundary. They

A map from 1755 showing Acadian lands at the head of the Bay of Fundy. (National Archives of Canada)

also established two forts, Beauséjour and Gaspéreau, across the isthmus of Chignecto, controlling access from the peninsula to the Canadian mainland. In 1754, Gov. Charles Lawrence of Nova Scotia led the construction of his own fort on the ruins of Beausesin, an older French Acadian village directly facing Beauséjour and Gaspéreau. Each set of fortifications could serve as a staging ground for expeditions against the other and into the hinterland beyond.

With violence in the Ohio region and negotiations stalled in Europe, this miniature arms race was set to become part of a larger conflict. William Shirley, governor of Massachusetts as well as one of Britain's commissaries under the Treaty of Aix-la-Chapelle, raised extra troops in anticipation of the 1755 campaign. Governor Lawrence, meanwhile, reactivated three regiments of British regulars who were already in Nova Scotia. By the time British major general Edward Braddock arrived at Williamsburg, Virginia, in April 1755, the two governors had already prepared an expedition against the French forts, which the general soon approved.

In late May 1755, some 250 British regulars and 2,000 colonial troops left Boston to join the forces already in Acadia, disembarking at Fort Lawrence on June 2. In 10 days, the expeditionary force straddled the road between Beauséjour and Gaspéreau and began

to dig in. Within two weeks after their landing, British batteries fired directly on the two forts, and British troops had either taken or destroyed several outposts.

To defend the two forts, French captain Louis Du Pont Du Chambon de Vergor relied largely on local help. Fearing reprisal attacks in case of a British victory, the Acadians served unwillingly and persuaded Vergor to sign a document that noted their concerns. Despite Vergor's efforts, however, most of his Acadian allies fought poorly. For example, defenders at an outpost on the Missaguash River fought for only one hour before either fleeing or surrendering. Several hundred more Acadians apparently deserted when artillery fire destroyed one French outpost on June 16. When Vergor surrendered the next day, he had with him only 150 French regulars and 300 Acadians.

Although the forts had fallen, British operations in the Bay of Fundy were not yet complete. With Vergor's surrender, the Canadian maritime frontier lay open to British conquest as far as St. John's, although an expedition against that post was saved for another year. The Acadians signed an oath of neutrality, although Lawrence continued to suspect that French agents from St. John's or Louisbourg might attempt to stir them to revolt. This

continued suspicion touched off the second wave of operations in Nova Scotia, more political than military and arguably more expensive for Britain's war effort in North America than doing nothing at all.

Lawrence's second wave of operations in 1755 involved the expulsion of several thousand Acadians, an action that would clear the British rear for further advances into Canada. Most Acadians, about 7,000 to 10,000, left the peninsula and resettled in Canada proper. But about 4,500 of the unfortunates left behind were shipped away from Nova Scotia and divided among the other nearby British colonies, more than 1,000 going to Massachusetts alone.

Although Nova Scotia remained tranquil for the remainder of the war, the exiled Acadians caused problems in the other colonies. The "French neutrals," as they were called, encountered major barriers to employment among the British colonists and were therefore largely supported at public expense. The resultant additional taxes caused unrest in some colonies, and more instances than usual of tax evasion. Given the authorities' fear of an Acadian revolt, for some time colonial troops were also held closer to their own frontiers.

In military terms, the Bay of Fundy expedition was a clear success. It ended decades of dispute about sovereignty over Nova Scotia and set the stage for further British advances into the Canadian interior. However, Lawrence's handling of the Acadians both surrendered the advantages of their declared neutrality and imposed a heavier tax burden on his neighbors to the south.

Beaujeu, Daniel-Hyacinthe Marie Liénard de

Born: August 9, 1711 Died: July 9, 1755

Officer in the colonial regular troops (troupes de la marine) of French Canada. Born on August 9, 1711, at Montreal, Daniel Beaujeu followed his father into the officer corps of the troupes de la marine and, like him, was posted to several of the far-flung forts of New France over his 26 years of service.

Beaujeu first achieved prominence as one of the leaders of a Canadian-Indian expedition that in the dead of winter managed to overcome and force the surrender of a superior force of New England troops forted-up at Grand Pré in Acadia (February 11, 1747). The bloody victory at Grand Pré was part of a 10-month campaign to liberate Acadia from its British occupiers. Lieutenant Beaujeu kept a journal of the campaign that demonstrated the superior woodsmen's skills of the Canadians and their ability to work closely with Indian allies.

In 1749, Beaujeu, now a captain, was given command of Fort Niagara (in present-day New York), one of France's most important North American posts. In addition to serving as a link in the fur trade between the western tribes and Canada, the fort played a vital role in keeping the Indian tribes in the region at peace with one another and on France's side.

Captain Beaujeu's biggest—and last—assignment was to the command of the even more strategic Fort Duquesne, newly built at the confluence of the Allegheny River and Monongahela River on the site of present-day Pittsburgh, Pennsylvania. Having been informed by a deserter that a large force of British regulars and American militiamen, under the command of Major General Edward Braddock and accompanied by siege artillery, was making its way toward Fort Duquesne, Beaujeu set about recruiting Indian allies and bringing in supplies and reinforcements over the long land and water route back to French Canada. A council of war decided to attack the invaders before they could open a siege of the fort, and in the morning of July 9, 1755, Beaujeu led a force of 637 Indians, 146 Canadian militiamen, and 108 officers and men of the troupes de la marine into the forest that separated the fort from Braddock's army to prepare an ambush. Aware that they were outnumbered nearly two to one and that the enemy had cannon, the Indian allies of the French—Ottawas and Delawares from nearby and Hurons and Abenakis brought in from Canada-began to waver. Beaujeu is reported to have stiffened their resolve by saying, "I am determined to go ahead and meet the enemy. What! Will you let your father go by himself? I am sure to beat them."

At about 1:00 p.m., before the ambush could be laid, Beaujeu's force stumbled into a British column in the forest and in an ensuing exchange of fire, he was killed. Fortunately, his equally competent and charismatic second-in-command, Captain Jean-Daniel Dumas, stepped into the breach and led the French force to its stunning victory over the much larger Anglo-American army. Beaujeu's body was taken back to Fort Duquesne and buried there on July 12, 1755.

Beaver Wars

Start Date: 1641 End Date: 1701

Series of wars fought by the five nations of the Iroquois Confederation (the Mohawks, Oneidas, Onondagas, Cayugas, and Senecas) against the French and their Native American allies. Historians have long debated Iroquois motivations in pursuing these conflicts (also known as the Iroquois Wars), which were punctuated by lulls, treaties, and truces. The Iroquois appear to have had two primary goals for their offensives. First, in need of a reliable source of European goods, the Iroquois sought to gain control of the fur-trading routes to their north and west and then move the beaver pelts from the upper Great Lakes to their Dutch (later English) trading partners at Fort Orange (modern-day Albany, New York). The second goal was an extension of the traditional practice of the "Mourning War." Having been devastated by outbreaks of European diseases in the 1630s, the Iroquois sought captives, some of whom would be adopted by clans to replace their dead. This practice was a longstanding one in Iroquois culture.

At odds with New France, the Iroquois desired a reliable supplier of European trade goods and so developed a trade relationship with the Dutch. Beaver pelts were the primary currency of the trade, but the Iroquois seem to have trapped most of the beavers in their territory by the beginning of the 1640s. Even if there were sufficient beaver pelts in Iroquoia by this time, they were not the thicker (and more valuable) pelts from the upper Great Lakes. Dependent on European weapons, tools, and cloth, and needing captives to replace the dead, the Iroquois began the so-called Beaver Wars by launching a series of attacks against other Iroquoian speakers in the early 1640s.

By virtue of their location, the Hurons served as middlemen in the fur trade, acquiring pelts from tribes such as the Nipissings to their north and the Ottawas to their west in exchange for maize. They then traded the pelts to the French for European goods. The Iroquois attacked the Hurons in 1648 and followed up with attacks that devastated Huronia in March 1649. Several aspects of the 1649 attack on the Hurons signaled that the Iroquois were practicing a new form of warfare. The Five Nations attacked during a time of year when warfare was usually suspended because of the difficulty of travel, and they struck in great force (estimated at 1,000 men) rather than in small groups. They were also very far from their homes in Iroquoia. In addition, they unveiled a new tactic, namely fighting at night. While the Hurons had the military capacity to respond in the wake of the 1649 attacks, the assault seems to have had an unnerving effect on them. The majority of the Hurons choose to flee in an effort to escape the Iroquois. Most Hurons went to Ganadoe (now Christian) Island in Lake Huron's Georgian Bay, where many of them perished of starvation during 1649-1650. Some went to Quebec, whereas others fled and were dispersed throughout the Great Lakes region and the Ohio Country.

The Iroquois followed up with other attacks in 1650. Many of the Hurons were captured or fled to the western Great Lakes or the Ohio Country. Presumably, the confederation asked the Eries and a tribe known as the Neutrals to join the Longhouse (the metaphor for the Iroquois League). When they refused, the Iroquois, well equipped with firearms obtained from the Dutch, devastated both nations, carrying off many of their people into captivity.

If the Iroquois goal in these campaigns was to gain control of the Huron fur-trading routes, they failed. Instead, the elimination of the Hurons shifted the epicenter of the trade westward, and Algonquian-speaking peoples, such as the Ottawas, replaced the Hurons as middlemen. The Five Nations, moreover, could not sustain this conflict without resting and rebuilding their stocks of muskets and ammunition. To facilitate this, and to keep New France from attacking them, the Iroquois allowed the French to send missionaries among them at Onondaga.

The Iroquois, however, soon found themselves at war again, this time with the Iroquoian-speaking Susquehannocks. Quite numerous, backed by the colonies of Maryland and Delaware, and able to obtain powder and firearms from Swedish traders, the Susquehannocks were a formidable foe. Unable to fight the Susquehannocks and to continue their campaign in the Great Lakes region, the Iroquois made peace with their enemies to the north and west. The Susquehannock threat came to an end, but for reasons that had nothing to do with the Iroquois. Attacked by Virginians in the opening phases of Bacon's Rebellion in 1676, the Susquehannocks were dispersed, and many were incorporated into the Seneca tribe.

Freed of the threat to their south, the Iroquois renewed their assault on the peoples of the Ohio Country and the Great Lakes. But over time, the ongoing conflict served to weaken the Five Nations. Their enemies acquired European weaponry while Iroquois losses mounted. The French even invaded Iroquoia and burned a Seneca town. The Mourning War tradition began to change the demographic makeup of Iroquoia, so much so that one Jesuit claimed that there were more adoptives than native-born among the Iroquois. Moreover, neither the French nor the Iroquois could hope to control the fur trade. The founding of the English Hudson's Bay Company shifted much of the fur trade northward.

In 1701, weakened, and having failed to gain control over the fur trade, the Iroquois leader Decanisora came up with a cunning diplomatic solution to their difficulties. In what came to be known as the Grand Settlement of 1701, the Five Nations began a new policy best described as "armed neutrality." In separate treaties, the Iroquois promised the French that they would remain neutral in future conflicts and assured New York that they would aid that colony, provided that it fulfilled certain promises the Iroquois knew would not be kept. For the next half a century, the Iroquois would invoke these agreements to ensure a steady flow of gifts. This diplomatic maneuvering would end only toward the end of the French and Indian War (1754–1763), when the then Six Nations joined the English in the conflict.

Berkeley, William

Born: January 1, 1606 Died: July 9, 1677

Governor of the English colony of Virginia (1640–1652 and 1660–1677). Born in Somerset, England, on January 1, 1606, William Berkeley was educated at St. Edmond Hall and Merton College, Oxford. He studied law at the Middle Temple in London before embarking on a tour of Continental Europe. In 1632, he secured a position in the household of King Charles I. Berkeley took part in the First and Second Bishops' Wars (1639–1640) and was knighted for this service.

Friends and relatives (his parents owned stock in the Virginia Company) assisted Berkeley in purchasing the post of governor of Virginia from its then-current occupant, Sir Francis Wyatt. Charles I approved and in 1642 Berkeley arrived at Jamestown, Virginia, to take up his post. Berkeley became the longest serving of all English North American colonial governors and of all Virginia governors, colonial or modern.

Berkeley soon had established a plantation near Jamestown, where as one of the planter elite he experimented with the production of crops for export other than tobacco. These included flax, rice, and fruits. Berkeley sought to make Jamestown the center of a diverse colonial trade that would increase both the wealth of Virginia and himself. A proponent of free trade and autonomy, Berkeley found himself at odds with the Crown's mercantilist principles, symbolized in the Navigation Acts.

In 1644, Berkeley traveled to England to secure arms for use in fighting the Native Americans during the Third Anglo-Powhatan War of 1644–1646. In October 1646, he signed the peace treaty that established reservations for the Native Americans who had been part of Powhatan's Confederation and that required them to pay annual tribute to the Virginia government.

With the onset of the English Civil War in 1649, the loyalty of many royal governors was severely tested. In 1649, Berkeley declared Virginia loyal to Charles I. As a result, in 1652 Parliament dispatched a military expedition to Virginia. Berkeley surrendered to these forces but not before winning terms that kept Virginia's political institutions largely intact. He then retired to his estate near

Jamestown until he was returned to power in January 1660 after the death of Gov. Samuel Mathews.

During his second period as governor, Berkeley sought to implement his economic plans for Virginia. Toward that end and to secure funding, he traveled to England in 1661. King Charles II supported the idea of economic diversification but he refused additional immediate funding and he rejected Berkeley's appeal for free trade.

Berkeley returned to Virginia in late 1662. His plans for economic diversification were largely unsuccessful and he became increasing unpopular as a result of taxes imposed to support that effort. Maryland's failure to honor an agreement regulating the production of tobacco also led to a sharp decrease in the price of that commodity, for which many small tobacco farmers blamed Berkeley. War with the Dutch also affected Virginia trade and its overall economy. Finally, Berkeley found himself sharply at odds with many settlers in western Virginia regarding his conciliatory policy toward the Native Americans in the face of mounting Indian raids in the 1670s. This came to a head following a Doeg raid in July 1675. Berkeley misread the situation, and his failure to mount a major punitive operation drew the anger of many westerners. Many of these settlers sought an all-out war against the Native Americans that would allow them to take the natives' land.

All of these grievances found expression in the summer of 1676 in a rebellion against the colonial government. Planter Nathaniel Bacon and his followers seized control of the capital of Jamestown, forcing Berkeley to flee. A reaction to Bacon's excesses enabled forces loyal to Berkeley to regain control following Bacon's death from natural causes in October 1676 and before the arrival of a sizable English military expedition to Virginia to accomplish the same end. Berkeley ordered the leaders of the rebellion hanged.

Berkeley quarreled with new officials sent out by London and resigned his office in May 1677. He returned to England in an effort to clear his name. Before he could accomplish this, however, Berkeley died in Twinkenham, England, on July 9, 1677.

Black Point, Attacks on

Start Date: October 12, 1676 End Date: June 29, 1677

Series of three skirmishes between Native Americans and English colonists during King Philip's War (1675–1676). Black Point, the site of a small English settlement and stronghold, was located in

present-day Scarborough County, Maine, just south of Portland. The initial attack on Black Point came on October 12, 1676, when Mugg Hegon, the Androscoggin sachem (chief), led between 50 and 100 native warriors against the English there.

The native attack was an extension of King Philip's War that had been raging for months between Massachusetts settlers to the south and the Wampanoags. By 1676, the violence had spilled north into Maine; several English settlements and farms had already been targets of native raids. Mugg did not attack immediately; he called for the post to surrender. He also offered to let the English leave with their possessions. While the fort's English commander, Captain Henry Jocelyn, was talking with Mugg, most of the English settlers fled Black Point by boat. Jocelyn, who had heretofore enjoyed cordial relations with Mugg, had no choice but to surrender, as the garrison was much reduced. Mugg kept his word and permitted Jocelyn and the remaining settlers to leave with their possessions. Without a shot being fired, Mugg and his men had forced the English to abandon Black Point.

Mugg had no use for the fort at Black Point and abandoned it by November 1676, believing that he had ousted the settlers for good. Nevertheless, the English reestablished the garrison at Black Point early the following year. Captain Bartholomew Tippen was the garrison's new commander. With the English garrison reconstituted and settlers beginning to return, Mugg once again attacked Black Point. This time the English were prepared and did not flee.

The battle began on May 14,1677, and ended on May 16. Tippen and his men did an admirable job holding back the large contingent of warriors, losing just three men in the three-day struggle. Native losses were greater, and Tippen allegedly shot and killed Mugg himself on May 16. Mugg's death was a severe blow to the natives, who quickly withdrew before day's end.

This English victory was fleeting, however. Just six weeks later, on June 29,1677, a force of 40 raw colonial recruits led by Captain Benjamin Swett and Lieutenant James Richardson, along with 200 allied native warriors, arrived at Black Point by ship. Their goal was to neutralize hostile natives in the area and end any threat to Black Point. A group of men from the garrison joined them as they disembarked. The English then spotted enemy warriors fleeing and gave chase. As it turned out, the flight served as bait for an ambush, into which the English quickly fell. The ambush cost the English 40 dead, including both commanders, and their native allies lost 20 warriors.

The attacks at Black Point were only one in a series of ongoing hostilities between English settlers and Native Americans in Maine that continued into the 18th century.

Black Robes

French Jesuit missionaries who operated in New France, beginning in 1625 with the arrival of Jean de Brébeuf, and innovated conversion methods among the Algonquins inhabiting the region. Nicknamed "Black Robes" by the Native Americans for their distinctive black cassocks, they were unique in the Americas for their conversion methods, determining that it was necessary for a missionary to live amid the natives as one of them. In so doing, the Black Robes were well equipped to translate Christianity into verbal and cultural terms the natives could understand.

The Black Robes prepared themselves by living among France's peasantry, but nothing could have prepared them for the privations and ordeals of life among the Algonquins and other native nations. The natives considered the Frenchmen to be ugly and stupid, their robes effeminate and ungainly for travel in the wilderness, and their ignorance of basic survival skills a liability to a party on the move. The Algonquins especially ridiculed their inability to speak the native language fluently.

The best a new arrival could do was stand aside and observe, learning as best he could until he developed the strength and stamina to paddle a canoe nonstop for several hours, carry it in a portage, sleep on the frozen ground in tight quarters, stomach the native cuisine, learn the elaborate customs, and—most importantly—master the language such that he could be deemed a "man of sense" and an asset to that particular community. Only the rare missionary could gain the respect of the natives. Indeed, most washed out—usually quite early, and most often because of an inability to learn the language.

However, years of experience allowed successful missionaries to prepare guides for those who followed, which along with their annual reports, published in Paris from 1632 to 1673 and known as *The Jesuit Relations*, constitute a sympathetic study of early colonial period Algonquin societies. Once esteem had been earned, the natives found much to admire among the priests: their indifference to wealth; their ability to withstand carnal desires (though puzzling), which meant they would not accost young girls or married women; and their courage and ability to endure discomfort ranging from ridicule from their companions to bodily torture from their enemies. Being bound by their rule never to carry a weapon or shed blood was considered a great liability, however, as the Indians could never understand a people who would not take up a hatchet in self-defense. But the priests' ability to endure all manner of hardship nevertheless garnered much respect.

The mastery of protocol meant that priests could become important leaders in native communities, and the rare priest who climbed to such a height found conversion a relatively easy busi-

ness. However, each priest had to win his own victories, which did not enhance the general reputation of the missionaries or the French as a whole. The sum total was disappointing progress, which accounts for the gradual abandonment of such nuanced conversion approaches after 1672, though Jesuit missionaries continued their work well into the 18th century.

Bland, Humphrey

Born: ca. 1686 Died: 1763

British military officer who served under the Duke of Marlborough in Flanders during the War of the Spanish Succession (known in America as Queen Anne's War) and who wrote a seminal manual on officer training. Humphrey Bland was most likely born at Bland's Fort, Queen's County, Ireland, around 1686. The details of his early life are obscure. First commissioned in the army in 1704, Bland served in the War of the Spanish Succession and later under the Duke of Cumberland in Scotland and Flanders. He held a number of garrison posts in the middle decades of the century, among them command at Gibraltar from May 1749 until 1754.

In 1727, Bland, then serving as the lieutenant colonel of the Second Light Horse, published a synthesis of his experiences on the Continent in the form of *The Treatise on Military Discipline*. He designed the work to be a set of instructions to young officers, as many of the older officers from the days of King William and Queen Anne were leaving the service. The manual, therefore, explained the methods for performing tasks, from posting guards to firing while in various formations.

The *Treatise* became an instant and enduring success. For example, the manual exercise in the *1728 Regulations for the British Army* was copied directly from Bland's *Treatise*. Likewise, numerous other sections were paraphrased and used in that work as well. It remained a key text for over 30 years, passing through a number of editions and remaining in use as late as 1759. Portions of the *Treatise*, as well as a number of shortened or simplified versions, also were printed in the North American colonies. In fact, George Washington is known to have owned a copy. In the years after the

Seven Years' War (1756–1763), Edward Harvey's 1764 manual replaced Bland's *Treatise* in the British Army.

Bland died in London in 1763.

Blockhouses

Crude but effective fortifications used frequently on the American frontier during the 17th and 18th centuries. While many fortifications used in North America during the colonial period employed the principles of European military engineering, blockhouses were commonsense expedients to the problem of frontier defense. Con-

Reconstruction of an American Revolutionary War-era blockhouse, Saratoga, New York. Blockhouses were defensive structures built to protect settlers from Native American attacks. (Library of Congress)

sequently, although blockhouses were occasionally used by regular military forces, they were more typically constructed by militiamen or provincials because of their simple design and the relative ease with which they could be erected.

A typical blockhouse was a two-story square or rectangular building with a sloping roof. Blockhouses were usually constructed of logs or thick planks to protect the defenders from enemy musket fire. Frequently, the second floor was constructed to overhang the first so that defenders could fire down on an enemy pressed against the lower wall. Loopholes in the walls allowed the defenders to engage the enemy while remaining hidden from view and protected from fire. Occasionally, blockhouses mounted light artillery pieces and incorporated such additional defensive measures as earthworks or a palisade.

A frontier community might build a blockhouse to serve as a place of refuge and defense in the event of a native attack, much like a garrison house. For example, Sir William Johnson constructed two blockhouses adjacent to his home at Johnson Hall in the Mohawk Valley (New York).

Blockhouses could also serve as stand-alone fortifications much like European-style redoubts. In this capacity, a blockhouse might be used to defend an avenue of approach or key piece of terrain, such as a ford or portage. They might also be constructed at intervals along an army's line of supply. Fort Ingoldsby, a blockhouse, was constructed in 1709 near Stillwater, New York, in support of Colonel Francis Nicholson's planned invasion of Canada along Lake Champlain. Supplies for his army at Wood Creek moved north from Albany in several stages based on the navigability of the Hudson River. At Stillwater, the small garrison of Fort Ingoldsby oversaw and protected the transfer of supplies from wagons to boats for the continued move northward.

Finally, blockhouses might serve as component parts of larger fortifications. In some cases these structures were placed at the corners of curtain walls in lieu of angled bastions. In this case, the deficiencies of blockhouses became apparent as they did not allow for interlocking fields of fire or all-around protection—a key advantage of angled-bastion fortifications. At other times, well-built blockhouses could serve as strong points within a larger fortification.

Bloody Brook Massacre

Event Date: September 19, 1675

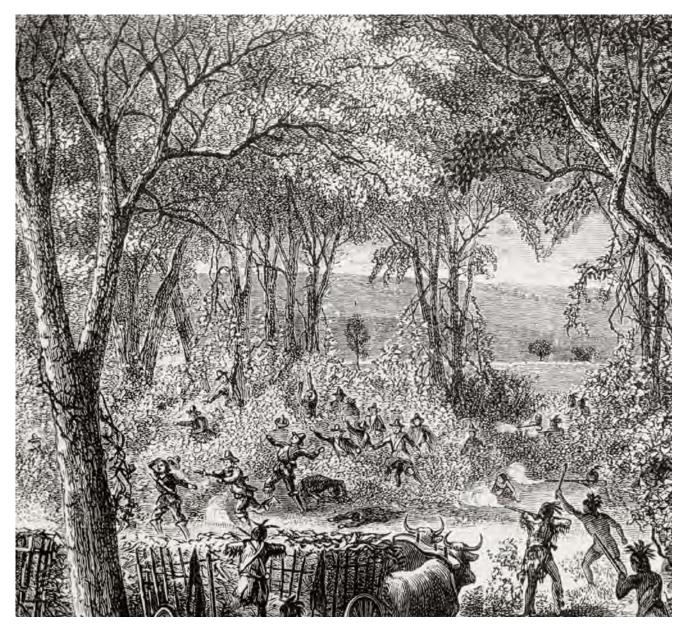

Native American ambush of colonial militiamen and a supply column near Deerfield, Massachusetts, on September 19, 1675. In mid-September 1675, as fighting along Massachusetts Bay's western frontier worsened during King Philip's War (1675–1676), colonial officials decided to abandon a number of outlying towns and consolidate their defenses. Deerfield, Massachusetts, was one of the towns abandoned, but its grain warehouses and barns were full of drying corn—food that would be greatly needed that winter. In mid-September 1675, Captain Thomas Lathrop was ordered to protect the wagon caravan carrying the corn from Deerfield south to Springfield. Lathrop and his Essex County militia company of some 60 to 70 men prepared themselves for the task at hand. They loaded the carts the night of September 18.

The next morning, September 19, Lathrop and his company, as well as the local teamsters in charge of the carts, set off. Captain Samuel Mosley's militia company scouted the area ahead of the wagon train. Lathrop reportedly was confident that no Indian party would attack such a large military force. He held that the Native American war parties struck only defenseless garrison houses and isolated farms. Accordingly, Lathrop had not positioned flankers or a vanguard. The wagon train traveled south along the forest path. When they reached Muddy Brook, about five miles south of Deerfield, Lathrop and his men found themselves quickly surrounded by hundreds of Wampanoags, Pocumtucks, Nipmucks, and other Native Americans.

The Indians attacked with deadly speed and efficiency. Ever after Muddy Brook was known as Bloody Brook. In his history of the war, Increase Mather claimed that Lathrop's men were so confident and carefree that they had placed their muskets in the carts in order to eat wild grapes along the stream bank, rendering them defenseless. The ambush was over in just a few minutes. At least 60 colonials were slain, including Captain Lathrop and 15 of the Deerfield men. Hearing the frantic calls of Lathrop's bugler, who had escaped the carnage, Captain Mosley and his company hurried to the scene, rushing the Indians and scattering the scalp hunters. As Mosley's scouting unit and the few survivors from the ambush struggled back to Deerfield that evening, they were taunted by Indians in the distance, who held aloft as trophies clothing from Lathrop's men's bodies. The next day, Mosley and his men returned to Bloody Creek to bury the English dead, including Captain Lathrop.

When news of the ambush or massacre traveled east, especially Essex County, the entire colony went into mourning. Reverend William Hubbard called it "that most fatal day, the saddest day that ever befel New England . . . the Ruine of a choice Company of young men, the very Flower of Essex."

The Bloody Brook Massacre is only one example from among hundreds of the style of wilderness warfare known as the "skulking

Etching of the Bloody Brook Massacre, September 19, 1675. (Brown Brothers)

way of war." Native Americans had long practiced the tactic of ambush, and their adoption of European firearms only made it more deadly. While colonial militias throughout the colonies were at first almost always the victims of ambush and other types of irregular warfare, some militia commanders adopted Indian tactics and eventually gave as good as they got.

Bloody Marsh, Battle of

Event Date: July 7, 1742

Battle between Spanish and English forces on July 7, 1742, on St. Simons Island, Georgia (just south of Savannah). The Battle of Bloody Marsh marked Spain's only offensive against the British in Georgia during the Anglo-Spanish War (or War of Jenkins' Ear). The Spaniards, led by Florida's Gov. Manuel de Montiano, launched the attack to avenge the destruction caused by the British invasion of Florida months earlier.

In mid-June 1742, a Spanish force of more than 4,000 soldiers marched and sailed toward southern Georgia. The Spaniards not only wished to make the British pay for the attack on St. Augustine but also intended to destroy British Georgia. Montiano believed the English could easily be defeated, as the Spaniards perceived James Oglethorpe's inability to conquer St. Augustine as a sign of significant weakness.

As the Spaniards made their way to their target, Oglethorpe, the governor of Georgia and commander of its troops, received word of the impending attack and prepared his defenses. Oglethorpe quickly constructed an outpost on the Frederica River. There a force of some 1,000 men prepared to defend Georgia against the Spanish attackers.

On July 5, the Spaniards landed on St. Simons Island. Two days later, the opposing armies met. Oglethorpe personally led his troops against the Spaniards. The primary battle occurred on July 7 amid a swamp known as Bloody Marsh. When the shooting began, the English found protection in the dense, subtropical foliage that surrounded the area. Lost in the swamp and confused by the topography, the Spaniards came under intense English fire.

When the shooting subsided, approximately 50 men, mostly Spaniards, had been killed. Montiano withdrew his men from the area, and on July 13 the Spaniards retreated from St. Simons Island and returned to Florida. Although the Battle of Bloody Marsh ended quickly and with few casualties, the incident had a profound impact on Georgia's internal politics. Oglethorpe's success against the Spaniards helped erase memories of his recent defeat at St. Augustine. Spain's failure at Bloody Marsh effectively ended a Spanish campaign to overthrow Georgia, a colony Spain had considered illegal and within the historic boundaries of Florida.

In one short battle, the debate over the southeastern borderlands came to a sudden end. Spain no longer attempted to retake Georgia and gradually accepted the legitimacy of Britain's southernmost colony in North America. Finally, victory against the Spaniards helped restore Oglethorpe's honor and reputation as a capable gentleman soldier.

Boston Massacre

Event Date: March 5, 1770

A bloody skirmish between American colonists and British troops on March 5, 1770, in Boston, Massachusetts, that aroused strong American sentiments against the British government. In October 1768, Britain sent two infantry regiments into Boston to quell unrest sparked by opposition to the hated Townshend Duties. The colonists detested the presence of the redcoats, refusing to quarter them and treating them with disdain and hostility. Tensions between the armed soldiers and the rebellious townspeople, especially laborers who competed with the soldiers for employment in nonmilitary jobs, eventually erupted in violence.

On the evening of March 5, 1770, a British sentry in front of the Boston Customs House reacted to taunts from a small group of Bostonians by striking a young wigmaker's apprentice in the face with the butt of his musket. A crowd formed around the fallen boy, verbally abusing the sentry and threatening him with clubs. The soldier retreated to the steps of the customs house as the growing mob began to hurl ice, snow, and debris at him. Cries of "fire" and ringing church bells increased the size of the crowd and added to the confusion. As the British officer of the day, Captain Thomas Preston, led an armed relief party to rescue the now terrified sentry, other British officers stopped their men from firing into the growing crowds in front of the Main Guard Barracks.

When Preston and his eight soldiers arrived at the customs house, the hostile crowd of 300–400 people turned violent. After a club flew through the air and struck a soldier in the head, some of the British troops fired their muskets in retaliation and panic, killing 5 men and wounding others. Preston ordered his men to stop shooting, but the damage had already been done. Only the arrival of Gov. Thomas Hutchinson, who promised a full inquiry into the matter, put an end to the melee. The presence of the redcoats in Boston had already infuriated the colonists. Now that the troops had drawn blood, the Boston Massacre became a symbol of British oppression and brutality. Local radical leaders and propagandists, most notably Samuel Adams and Paul Revere, turned the event into a recruiting tool, and the dead became martyrs in the incipient struggle for independence.

In the aftermath of the Boston Massacre, some 12,000 colonists marched in the funeral for their fallen comrades. Charged with murder, Preston and his men stood trial two months later. They were defended by John Adams, who argued that they had acted

The Boston Massacre of March 5, 1770, which resulted from growing tensions between Bostonians and British troops. Five men died in the incident, a harbinger of the American Revolution. (National Archives)

in self-defense. The jury acquitted Preston and found two of his soldiers guilty only of manslaughter. The soldiers were branded on the thumb and discharged from the army. The overall fairness of the trial, combined with news that Parliament had repealed all the Townshend Duties except the one on tea (ironically on the same day the massacre took place), dissipated the passions aroused by the actual March event and led to a relatively quiet period in British-colonial relations, awaiting the next spark that would set them alight.

Boston Tea Party

Event Date: December 16, 1773

Colonial rebellion against the Tea Act. The Boston Tea Party led inexorably to the outbreak of the American Revolutionary War at Lexington and Concord 16 months later.

At the end of the French and Indian War (1754–1763), Parliament adopted a new policy of taxing its American colonies to help defray the costs of administration and defense. Almost immediately colonists objected, insisting that they should be taxed only by their own provincial legislatures, not by Parliament, where they were not represented. After one ministry repealed the unpopular Stamp Act in 1766, Parliament adopted the Townshend Acts, levying duties on tea and a few other commodities imported into America. Again the colonists protested. This time most of the merchants in the leading seaports agreed not to import any goods from England until the act was repealed. Much of their effort focused on dutied tea, which many Americans stopped drinking altogether.

Historic print showing the Boston Tea Party, when Bostonians, dressed as Indians, threw East India Company tea into the harbor on December 16, 1773. (National Archives & Record Administration)

So successful was the boycott that in the spring of 1770 Parliament was forced to repeal every duty save the one on tea, which it retained to uphold its power of taxation. In turn, the merchants rescinded their nonimportation agreements. However, they generally continued their ban on tea. Meanwhile, however, the East India Company, which monopolized the importation of tea into Great Britain, was accumulating an enormous surplus due to lagging sales. In 1773, to assist the company out of its financial difficulty, Parliament passed the Tea Act, which removed the import tax levied in Britain and gave the East India Company a monopoly on tea sold directly to colonial consumers through company appointed tea agents, enabling it to compete with smuggled tea. But the head of the ministry at that time, Lord North, insisted on retaining the hated colonial tea duty.

In the autumn of 1773, word reached America of the East India Company's intention to send more than 2,000 chests of dutied tea to Boston, New York, Philadelphia, and Charles Town (present-day Charleston). Opposition in all four ports quickly focused around two themes. First was the fear that submission to dutied tea would pave the way for Parliament to levy other taxes in the future. Second was the concern that permitting the East India Company to establish a monopoly in tea would open the door to its monopolizing other aspects of colonial trade. The colonial governors at New York,

Philadelphia, and Charles Town were reluctant to intervene to protect the importation of tea in the face of staunch public opposition.

Meanwhile, the tea consignees in those ports resigned their commissions. Charles Town's tea was ultimately impounded at the custom house. At both Philadelphia and New York the ships were forced to return to England with their cargoes.

At Boston the situation was very different. There the royal governor, American-born Thomas Hutchinson, had no intention of giving in to demands that Boston's tea ships be sent back to England. For one thing, the East India Company had appointed two of his sons as consignees, and they stood to profit from the sale of its tea. Secondly, Hutchinson and the leader of the opposition, Samuel Adams, had been bitter enemies for years. Therefore, the governor had old scores to settle. He was confident that should matters come to a head, he would have the support of numerous British soldiers, naval vessels, and other royal officials. The fact that the Hutchinsons and their fellow consignees were the worst violators of the tea boycott gave the Patriots a score of their own to settle. A showdown at Boston over the East India Company's tea was thus all but inevitable.

On November 28, 1773, the first of the company's tea vessels, the ship *Dartmouth*, entered Boston Harbor, joined a few days later by the ship *Eleanor* and the brig *Beaver*. The three ships carried altogether 340 chests of dutied tea. The law required that cargo owners

pay all customs duties within 20 days of entering a port or face seizure of their goods. If that were to happen, the Patriots feared, the tea would quickly find its way into the hands of the consignees, who would put it up for sale. The deadline for payment was December 17.

The Patriot leaders called for public meetings on November 29 and 30, which were attended by more than 5,000 people. They demanded that the tea be returned to London without payment of the duties. However, Hutchinson and the consignees had already left town to avoid such intimidation. They were content to let the clock run out, knowing that the vessels could not get out by the fort on Castle Island without a pass from the governor. Having failed to persuade Hutchinson and the consignees to give in, the Patriots had the vessels brought up to Griffin's Wharf. They placed armed guards on board to prevent the tea from being unloaded clandestinely.

In mid-December, the Patriots assembled two more mass meetings, again with over 5,000 in attendance. On the afternoon of December 16, the second assemblage, with Samuel Adams presiding, made one final effort to have the tea returned. William Rotch, the young captain of the ship *Dartmouth*, was dispatched to deliver the demand to the governor in Milton. A last-ditch effort at compromise fell through, and Hutchinson refused to grant a pass to leave. Shortly after dark the forlorn ship captain returned emptyhanded to the harbor. It looked as though Hutchinson was on the verge of winning a major victory.

But suddenly from the gallery came a war-whoop, answered by similar cries from a small group of men disguised as Native Americans. Followed by thousands of ordinary citizens, they rushed to the waterfront, boarded the vessels, and destroyed the tea. The rebels hoisted 340 chests of tea, most weighing nearly 400 pounds, broke them open with hatchets, and dumped the contents into Boston Harbor.

At first no one would admit taking part in this momentous event. But the passage of time has since revealed that among the Patriots disguised as natives were members of Boston's Committee of Correspondence, the grand lodge of Masons, the Long Room Club, and other groups of political activists. A few were merchants or other prominent citizens, including Paul Revere, William Mollineux, and Dr. Thomas Young. Most were artisans and apprentices, however.

John Adams termed the tea party "the most magnificent Movement of all." As news of Boston's action spread down the Atlantic seaboard, carried by Revere and other post riders, it generated a fresh wave of unity throughout the continent that would pave the way for a congress of all the colonies nine months later.

By far the most significant consequence of the Boston Tea Party was the reaction it provoked in Great Britain. Realizing the difficulty of singling out individual perpetrators for prosecution, the ministry instead determined to punish Bostonians as a whole. Not only was such a policy easier to execute, but it gave vent to Britain's long-festering anger with Massachusetts. The ministry was determined to distinguish Boston from the other ports, which had also rejected dutied tea but by less violent means. In the end, the ministry pro-

posed and Parliament adopted the Coercive Acts, which included the Boston Port Act, the Quartering Act, the Impartial Justice Act, and the Massachusetts Government Act. The Boston Port Act closed the port of Boston until colonists paid for the tea and moved its customs house affairs to Plymouth. The Quartering Act allowed the placement of troops in private homes. The Impartial Justice Act allowed the governor to transfer trial to Britain. The Massachusetts Government Act altered the charter of the Massachusetts Bay Colony to give royal officials more control over the rebellious province.

Before the Boston Tea Party, most Americans would have continued to accept British rule, perhaps for decades to come. But Boston's bold act of defiance drove the ministry to adopt punitive measures that Patriots in all of the colonies could not accept. In the months that followed, they closed ranks and made common cause with beleaguered Boston.

Bougainville, Louis Antoine de, Comte de Bougainville

Born: November 12, 1729 Died: August 20, 1811

French military officer and explorer. Louis Antoine de Bougainville was born into a well-to-do family in Paris on November 12, 1729. He acquired renown over his long life as a mathematician, soldier, naval officer, explorer, and scientist. Bougainville enlisted in the army in 1750, just a year before publication of his much-acclaimed *Traité de calcul intégral* (Treatise on Integral Calculus) won him membership in the Royal Society of London.

Having been promoted to captain in February 1756, Bougain-ville became aide-de-camp to Major General Louis-Joseph, Marquis de Montcalm later that year. Montcalm had been given command of French regulars in Canada during the French and Indian War. Bougainville's fluency in English helped him to win the assignment. He sailed for Canada in April 1756 and, although he had no previous combat experience, took part just three months later in the successful assault by Montcalm's troops at Oswego.

Montcalm praised Bougainville in dispatches to the War Ministry in Paris, although he expressed concern about Bougainville's recklessness under fire. In August 1757, Bougainville participated in the siege and capture of Fort William Henry. Montcalm later chose him to carry news of the French victory back to Governor Pierre de Rigaud Vaudreuil in Quebec.

Although a protégé of Montcalm, Bougainville did not share his disdain for the kind of warfare waged on the frontier by colonial troops and their Native American allies. Indeed, he endorsed adoption of the "skulking way of war" practiced by the natives. Bougainville did share, however, his patron's low opinion of Canadian irregulars. In a dispatch to the minister of marine, he praised the French regulars and colonial troupes de la marine for their service, but he lamented the attitudes and abilities of the Canadian militiamen and natives. He also expressed horror at the irregulars' tolerance of the use of torture by their Native American allies.

In July 1758, Bougainville was wounded in the Battle of Carillon near Ticonderoga, New York. Four months later, Montcalm sent him to France to report to the Crown on the critical state of New France's defenses and to plead for reinforcements and supplies. Promoted to colonel and knight of Saint Louis while in France, Bougainville returned to Quebec in March 1759 with 20 supply ships. The ships, however, brought only 300 reinforcements.

Bougainville was in charge of defense of the St. Lawrence River shoreline in the run-up to the crucial Battle of the Plains of Abraham of September 13, 1759. He succeeded in forestalling three attempts by the British to land troops before they managed to gain a foothold beyond his sector at Anse au Foulon. Poor communications with Montcalm in Quebec meant that Bougainville was unable to concentrate his scattered troops in time to march to the aid of his commander in Quebec. Following the loss of Quebec, Bougainville was delegated to negotiate an exchange of prisoners and care for the French sick and wounded. His English-language skills were also employed in negotiations for the surrender of Montreal in September 1760. At the close of hostilities, Bougainville was taken prisoner along with the rest of the French army and repatriated to France.

Bougainville's naval career commenced in 1763. Following his voyage of exploration to the Pacific, celebrated in his best-selling book, *Voyage autour du monde*, he served as a naval officer in the American Revolutionary War. Surviving the subsequent French Revolution, Bougainville helped to organize the scientific component of Napoleon Bonaparte's 1798 expedition to Egypt. Named count of the empire in 1808, his last official duty was to preside over the courtmartial held to assign blame for the French naval defeat at Trafalgar in October 1805. Bougainville died in Paris on August 20, 1811.

Bouquet, Henry

Born: ca. 1719 Died: August 25, 1765

Swiss-born British Army officer. Born in Rolle, Switzerland, most likely in 1719, Henry Bouquet was the son of a hotel proprietor. He entered foreign military service at a young age, first with the United Provinces and then with Sardinia. He returned to Dutch pay after the War of the Austrian Succession (1740–1748), eventually attaining the rank of captain commandant of the Swiss Guards.

In the Netherlands in 1755, Bouquet met another countryman, James Prevost, who persuaded him to travel to the New World as a field officer in a proposed foreign Protestant colonial regiment to be raised in Pennsylvania by the British government. Granted authority in 1756 by the British government to hold a military commission, Bouquet became lieutenant colonel of the first battalion of the 62nd (Royal American) Regiment of Foot. He remained in British North America with the regiment for the remainder of his life.

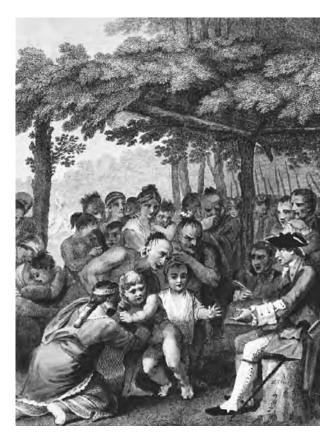

Illustration showing natives delivering captives to British colonel Henry Bouquet. (Library of Congress)

Bouquet's association with the western frontier began soon after his arrival in the mid-Atlantic colonies. Although transferred to Charles Town (modern-day Charleston), South Carolina, with five of his companies to bolster defenses there through 1757, he returned to Pennsylvania as a principal commander in British brigadier general John Forbes's 1758 expedition against Fort Duquesne. This successful advance was marred by a defeat at the Battle of Grant's Hill in which the Royal Americans suffered 42 casualties on September 14, 1758. Nevertheless, the advance continued with the French abandoning their base at the Forks of the Ohio in November. The site was then occupied by British troops, who there constructed a massive structure they named Fort Pitt. Bouquet then spent much of his time as a commander of advanced posts, for his battalion provided most of the troops to these remote installations. Logistics, American Indian diplomacy, and garrison duties absorbed his attention until the outbreak of Pontiac's Rebellion in the early summer of 1763.

Bouquet played a pivotal role in quashing this insurrection among the eastern tribal communities. While leading a relief column to the aid of besieged Fort Pitt, he was ambushed by Shawnee and Delaware warriors at Bushy Run on August 5, 1763. As in earlier irregular actions fought throughout the French and Indian War (1754–1763), the initiative lay with skirmishers, who chose their ground carefully for this set-piece battle. Withdrawing to a defen-

sive position at Edge Hill, however, Bouquet tricked the illusive braves into staging a reckless assault across open ground the following day. Native resolve crumbled in the face of a daring British bayonet counterattack and heavy cross fire. The Native Americans then abandoned both the field and the siege around Fort Pitt. This victory was followed up a year later by a measured advance by British forces into the upper Muskingum Valley. The 1764 campaign, designed and led by Bouquet, was a complete success, which forced Ohioan villagers to sue for peace.

Bouquet did not live long to enjoy the fruits of victory. Naturalized by parliamentary statute on June 2, 1762, he was promoted to the rank of brigadier general three years later and was given the command of British troops in the Southern Department. He died at Pensacola on August 25, 1765, the day after arriving in Florida to take up his new post.

Bourlamaque, François Charles de

Born: 1716

Died: July 23-24, 1763

French Army officer, third in command of French forces in New France during much of the French and Indian War (1754–1763) and governor of Guadeloupe (1763). François Charles de Bourlamaque was born in 1716 in Paris. Little is known of his early years, although in 1739 he joined the Dauphin Infantry Regiment and saw action in the Flanders and Rhine expeditions during 1742–1744 in the War of the Austrian Succession (1740–1748). He was promoted to captain in 1745.

Promoted to colonel in 1756, when he was also awarded the Cross of Saint Louis, Bourlamaque arrived in New France (Canada) that May. He was third in command of French forces after Maréchal de Camp Louis-Joseph, Marquis de Montcalm, and Brigadier General François Gaston de Lévis.

In August 1757, Montcalm assigned Bourlamaque the task of conducting the siege of Fort William Henry. He successfully carried out this operation, which led to the surrender of the fort on August 9. The following year, Bourlamaque again led troops under Montcalm's command, this time during the British attempt to capture

Fort Carillon (Ticonderoga). Major General James Abercromby led a force of 16,000 British troops against the fort. Montcalm had only 3,600 men to defend the post, but the French built an ingenious system of defensive works that Bourlamaque helped supervise. Abercromby's frontal assault on the works proved a failure, as the French repeatedly repulsed the British, who eventually had to withdraw from the area.

In February 1759, King Louis XV rewarded Bourlamaque for his services by promoting him to brigadier general. Bourlamaque then took sole command of the troops defending the Lake Champlain approach to Montreal while Montcalm commanded the defense of Quebec. Bourlamaque had just 3,000 troops to stop Major General Jeffery Amherst's force of more than 11,000 men. Fortunately, Amherst was cautious and did not use his advantage as aggressively as he might have. On July 23, 1759, Bourlamaque withdrew from Fort Carillon to Fort Frédéric (Crown Point). On July 31, Bourlamaque ordered Crown Point destroyed, and the French withdrew to Île-aux-Noix. Here Amherst's advance stalled for the remainder of the year. With Montcalm's death in 1759, Bourlamaque became second-in-command of French forces.

In 1760, Bourlamaque led French forces in the effort to recapture Quebec and was wounded in the subsequent Battle of Sainte Foy. He continued to lead French troops until the surrender of New France to the British on September 8, 1760.

Bourlamaque then returned to France, where he became commander of the Order of Saint Louis. In 1761, the French government dispatched him to Malta to help defend the island from the Turks. In February 1763, he assumed the post of maréchal de camp and governor of Guadeloupe. Bourlamaque died in Guadeloupe on the night of June 23–24, 1763.

Bow and Arrow

The primary weapon of precontact Native American warriors, used throughout both North and South America. The material employed

in making bows varied from region to region. Wood from the Osage orange (bois d'Arc) tree was widely recognized as the best bow-making material. However, Osage orange grew only in the Red and Arkansas river valleys in southern Oklahoma and northern Texas, so native bow makers had to use the best materials at hand. Eastern woodlands warriors fashioned their bows from hardwoods such as ash, oak, hickory, and maple.

Occasionally, bows were fitted with a smaller "reverse bow" attached to the front in an attempt to generate more resistance and thus impart more force to the launched arrow. Plains warriors often chose horn or antler as their materials of choice for making bows.

Drawing, ca. 1585, showing a Native American from Florida with bow and arrows. Note the man's body markings. (Library of Congress)

72 Brackett's Wood, Battle of

Used in both war and hunting, Native American bows were often offset by native defensive capabilities. In the northeast, for example, Iroquois and Huron warriors wore armor made of bark and reeds that could deflect an arrow. But that did not mean that Europeans could dismiss native bowmen as ineffective. During his incursion into the American Southeast, Spaniard Hernando de Soto and his men discovered that although their plate armor could deflect Apalachee arrows, the latter could penetrate chain mail, and even if they did strike plate armor, the arrows, made of cane, splintered, causing painful injuries when they shattered. New England colonists soon discovered that Native American arrows were driven with such force as to actually penetrate through a human body. There is little technical data regarding Indian bows from the colonial period, but one Massachusetts Bay captain tasked with recovering several victims of an Indian raid observed that one had been "shot through... the right side, the head sticking fast, half through a rib on the left side." Cabeza de Vaca noted that the arrows of Apalachee warriors in Florida penetrated full-grown poplar trees to a depth of six inches.

Prior to European contact, native warriors tipped their arrows with bone, horn, obsidian, flint, and, in some cases, copper from the upper Great Lakes region. When more durable European-manufactured products became available, the native people eagerly adopted them. The Iroquois peoples, for instance, cut up copper pots and transformed them into arrowheads. Recognizing a potential market, Europeans soon began offering ready-made iron arrowheads as a trade item.

While native warriors recognized the power of firearms—and were perhaps fascinated by them as novelties—these did not replace the bow and arrow immediately. The early matchlock weapons were heavy, clumsy, and required yards of specially treated cord, known as a match, in order to operate. However, with the advent of flintlock weapons, native demand for firearms increased. Once native warriors became dependent on firearms, they lost their skills at making and using the bow and arrow, which left them at the mercy of colonial governments in time of conflict, who could simply cut off their supplies of shot and gunpowder.

Brackett's Wood, Battle of

Event Date: September 21, 1689

Battle fought on September 21, 1689, outside the town of Falmouth (now Portland), Maine, between English colonists and French-allied Native Americans during King William's War. Brackett's Wood

(now Deering's Oaks) was part of a farm owned by Captain Anthony Brackett. At the time, Brackett was serving as the commander of the local garrison, Fort Loyal, which he had commanded since 1682. The town of Falmouth was a settlement with about 25 families.

Having spotted a force of some 700 warriors on Palmers Island (now Peaks Island), the local colonists were rightly concerned that the natives would raid their town and sent an urgent request for help to colonial officials in Boston. At the time, Maine was considered part of Massachusetts. In response, in late September 1689, Boston sent a force of 160 men under the command of Major Benjamin Church to Falmouth. The force, which arrived by sea, also included some allied natives.

On the morning of September 21, French-allied warriors were discovered camping in a forested area of Brackett's Woods. One of Brackett's sons had discovered them as the natives were preparing their breakfast. Church's force, now including Captain Brackett and some other local men, set out using the available natural cover to do battle with the invaders. The engagement lasted six hours. About an hour into the battle, Church tried to outflank his opponents, but they withdrew when they saw what Church was attempting to do. While Church was attempting the flanking maneuver, the main body of his force had continued to engage the enemy but was running low on ammunition. A local native by the name of Captain Lightfoot repeatedly brought more ammunition to the English side. Still, ammunition was in desperately low supply. Church eventually brought the two parts of his force back together and launched a final assault on the natives, forcing them to flee.

English loses were some 14 killed and 7 wounded. Among those killed was Captain Anthony Brackett. Native losses are not known because they carried their casualties off with them when they fled. Although Church's casualties had been high, he nevertheless staved off a native attack on Falmouth. The Battle of Brackett's Wood brought a temporary halt to native raids in the area. The calm was very short-lived. In the summer of 1690, Fort Loyal again came under attack by a mixed French and native force that captured the post and killed most of the settlement's inhabitants.

Braddock, Edward

Born: December 1694 Died: July 13, 1755

British major general in the French and Indian War (1754–1763) who led the disastrous 1755 campaign against Fort Duquesne.

British major general Edward Braddock. Named commander of British forces in North America in 1755, Braddock's column was ambushed and he was killed by French and Indian forces near Fort Duquesne that same summer. (Corbis)

Edward Braddock was born in London in December 1694, the son of Major General Edward Braddock (1664–1725), a lifelong officer in the Coldstream Guards, one of the finest British regiments. In 1710, Braddock's father purchased a commission for him in the Coldstream Guards.

Braddock's subsequent military career was marked primarily by routine duty, in which he saw very little military action. He became a lieutenant in the regiment's grenadier company in 1716 but saw no action in the Jacobite uprising of 1715. He also experienced little combat during the War of the Austrian Succession (1740–1748), or the Jacobite Rising of 1745.

Braddock became first major of the regiment in 1744 and led a routine reconnaissance to Ostend in Flanders the same year. In 1747, now a lieutenant colonel, he served under the Prince of Orange in Holland during the siege of Bergen-op-Zoom. In 1753, Braddock sold his commission in the Coldstream Guards for £5,000 and purchased the colonelcy of the 14th Regiment of Foot. Shortly thereafter he became governor of Gibraltar, where his regiment was posted.

Following the surrender of Virginia militia lieutenant colonel George Washington at Fort Necessity in July 1754, Britain decided on a strong response to include attacks against France's Ohio forts, Nova Scotia, Fort Niagara, and French posts along the Lake George–Lake Champlain corridor, including Crown Point. This plan called for a commander in chief with sweeping authority to supervise all military operations there, as well as to direct civilian

colonial authorities to provide logistical support. Although Braddock had no prior experience directing a major military campaign and had seen little action in his 45-year army career, he was tapped for the position in the autumn of 1754 and became a major general as a result. He landed in Virginia in February 1755.

Braddock personally assumed command of the expedition against Fort Duquesne, which he launched from Alexandria. He quickly developed a reputation as a stern, impatient officer, unwilling to heed the advice of colonial military men experienced in wilderness fighting. His roughshod treatment of civil authorities and provincial assemblies greatly contributed to the logistical difficulties that marked his effort against Duquesne. He conducted what was essentially a European-style campaign, which ended in the destruction of his force several miles from his objective on July 9, 1755. Braddock was mortally wounded in the debacle and died on July 13, 1755. To disguise his place of death, he was buried by retreating British forces along the road that bears his name near present-day Uniontown, Pennsylvania.

Braddock's Campaign

Start Date: March 1755 End Date: July 1755

Failed British offensive against Fort Duquesne during the French and Indian War, spring to summer 1755. When news of the French victory over the Virginia Militia at Fort Necessity arrived in London in September 1754, the British cabinet debated a new course of action in the French and Indian War. The Earl of Albemarle, governor of Virginia in absentia and a career soldier, recommended that "officers, and good ones" be sent to North America. The king's principal minister, the Duke of Newcastle, concurred but believed that a regiment of Highlanders might help still more. The Duke of Cumberland, the king's son and captain general of Britain's armed forces, went further, proposing two Irish regiments (the 44th and 48th) and a commander in chief for American forces.

By November, Cumberland's plan had been adopted, and Major General Edward Braddock was named commander in chief for North America. Before his departure from England on January 13, 1755, Braddock received orders to attack Fort Duquesne, Niagara, Crown

Point, and Fort Beauséjour. Once in America, however, it was left to his discretion whether to attack them in succession or all at once.

On his arrival in Williamsburg, Virginia, in March, Braddock found that colonial officials had been quite busy over the winter. Particularly notable was Massachusetts governor William Shirley's war effort, which raised an extra 2,000 troops for the Beauséjour operation. Both Shirley and British Indian agent William Johnson proposed that the main British attack be directed against Niagara, but Braddock stuck to his orders to focus on Fort Duquesne. Nevertheless, Braddock exercised his discretion in allowing Shirley and Johnson to attack Niagara and Crown Point, respectively, while Braddock took his own force of 2,200 men to Fort Duquesne. The remainder of colonial forces, under the command of Nova Scotia governor Charles Lawrence and Colonel Robert Monckton attacked Fort Beauséjour.

As with Shirley and Johnson in New York and Washington the previous summer, Braddock envisioned a road-building project through the wilderness, punctuated by a European-style siege. At first, he proposed to take a large contingent with supplies for a major siege, but he soon split his force into roughly equal parts—one to transport the immense train of baggage and artillery and the other, a flying column, to scout ahead and prepare for the siege.

Alert to the dangers of wilderness warfare, Braddock regularly employed more than a third of his force for screens and patrols. In June and July, the army advanced steadily, and thwarted the attempts of French commander Claude Pierre Pécaudy de Contrecoeur to disrupt its progress. Despite raids on the colonial frontier, Braddock continued forward, increasing the panic at Fort Duquesne.

On July 8, as Braddock forded the Monongahela River, only 10 miles away, Contrecoeur prepared a last, desperate attempt by sending about half of Fort Duquesne's garrison against Braddock. With 36 officers, 72 colonial regulars (troupes de la marine), 146 Canadian militiamen, and 637 American Indian allies under his command, Captain Daniel Liénard de Beaujeu was supposed to attack Braddock's column east of the Monongahela, but his force was dispatched too late. Ultimately, the two forces met just west of the river shortly after noon on July 9.

As he continued his march on Fort Duquesne, Braddock sent forward a vanguard of about 300 men, followed by an independent company and 250 workers. The main body of 500 men followed with the artillery and another 100 covered the rear. Unlike past marches, however, Braddock missed a key terrain feature on the morning of July 9—a hill to his right and front from which scouts would have been able to detect Beaujeu's approach and prepare an adequate defense. Braddock's screening forces were unusually small and close to the main body that morning, and the main body was split along the road, with only two ranks to either side of the artillery train. This deployment may have reflected Braddock's confidence in his progress, but it left his force more vulnerable to surprise.

When the French attacked, Braddock's men fought bravely, but they paid the price for their commander's errors. The opening volleys went well for the British, killing Beaujeu. But the vanguard, flanked by Beaujeu's native allies, fell back on the main body, which Braddock had ordered to advance. The units became intertwined, and Braddock's regulars, strung out on either side of the baggage train, struggled to form a line of battle. Having fallen victim to an ambush, Braddock was unable to use the light infantry tactics that had served him throughout his march.

To make matters worse for Braddock and his men, their battle-field was a Native American hunting ground, designed to conceal hunters and expose prey. Braddock's men, still trying to form ranks, soon became targets for American Indian marksmen, and the officers on horseback were the most vulnerable of all. Although the British and some colonials fought bravely for more than three hours, they were unable to form units larger than a platoon, and most of their fire proved ineffective.

Unaccustomed to the war whoops and hunting tactics of the natives, the regulars attempted to form companies, fire in volleys, and look for the visual cues of the European battlefield. Panic in the British ranks caused several incidents of friendly fire, increasing the confusion. Braddock's force also became an increasingly dense mass, as the terror of battle drove men closer together. In reality, they only proved an easier target.

Discipline finally and irretrievably crumbled when Braddock was shot from his horse. The workers, rearguard, and most of the provincial troops had already fled, leaving no one available to cover the withdrawal. The constant pressure from Canadians and American Indians turned the retreat into a rout, and entirely reversed the previous month of British progress. Braddock's force had lost two-thirds of its numbers and most of its supplies and equipment. French and native losses totaled fewer than 40. The progress made on Braddock's road once promised a steady flow of supplies from Virginia and Maryland to Fort Duquesne; that same road now rendered the British colonies more vulnerable than ever.

The French victory on the Monongahela released forces from their defense of Fort Duquesne and rendered abortive Shirley's proposed expedition to Niagara. Though Shirley took over command of colonial forces from the deceased Braddock, his relations with Johnson steadily deteriorated as they squabbled over supplies at Albany. Johnson later allied with the faction led by Lt. Gov. James DeLancey of New York and Thomas Pownall of New Jersey to intrigue against Shirley, undermining his authority by the spring of 1756. Major General John Campbell, Earl of Loudoun, then replaced Shirley as commander in chief. He made several important logistical and administrative reforms but proved militarily ineffective. Only when Major General Jeffery Amherst took over British military operations in 1758 did British forces return to the offensive against Fort Duquesne—this time successfully—under Brigadier General John Forbes.

Bradstreet, Anne

Born: 1612

Died: September 16, 1672

One of the founding members of the Massachusetts Bay Colony and a poet. Anne Dudley was born in 1612 in Northampton, England. Her father, Thomas Dudley, was a wealthy man who supported his

Etching of Anne Dudley Bradstreet, one of the founders of the Massachusetts Bay Colony and a poet. (The Granger Collection)

daughter's education and encouraged her to develop her literary talents. Dudley received a fine education from private tutors and from her own explorations of her father's well-stocked library. She married Simon Bradstreet in 1628 when she was 16 years old. In 1630, accompanied by her husband and parents, she immigrated to the Massachusetts Bay Colony.

Along with hundreds of other Puritans led by John Winthrop, the Bradstreet and Dudley families arrived in Boston, Massachusetts, in June 1630. Bradstreet's father had been named deputy governor of the Massachusetts Bay Company, and her husband was an assistant of the company. Bradstreet lived first in Cambridge, then Ipswich, and finally, after 1644, in North Andover, where she spent her remaining years. She and her husband raised eight children: four sons and four daughters. Highly esteemed in the community, she was devoted to her family and faith.

It is difficult to know with certainty when Bradstreet began writing poetry, but her earliest surviving poem was written in 1632. She wrote most of her poems between 1642 and 1647, but she continued until the fall of 1670, when presumably she became too ill to write. Inspired by encouragement from her family, her own love of writing, and her faith in God, Bradstreet became English North America's first poet, as well as one of its finest.

Bradstreet wrote frankly of human nature and of her own heart. Her poems were personal, devout, and often humorous. A model of female piety, she found space within her writings to muse about religious questions and experiences. She wrote freely about love, especially for her husband. One of Bradstreet's most poignant poems related the devastation many colonial women faced during the potentially dangerous times of pregnancy and childbirth.

Bradstreet wrote her poems for herself and other members of her family. Without her knowledge, however, her brother-in-law published her poems in London in 1650, titling the work *The Tenth Muse Lately Sprung up in America; or, Severall Poems, Compiled with Great Variety of Wit and Learning, Full of Delight . . . by a Gentlewoman in Those Parts.* It was the first book of poetry published by a North American colonist. Bradstreet died on September 16, 1672, following several years of illness.

Bradstreet, John

Born: December 21, 1714 Died: September 25, 1774

British Army officer and colonial administrator. Born at Annapolis Royal, Nova Scotia, on December 21, 1714, John Bradstreet was baptized Jean-Baptiste Bradstreet, the son of a British Army officer and an Acadian mother. After serving as a volunteer with the 40th Regiment of Foot, Bradstreet received an ensign's commission in 1735. In May 1744, he was captured in the French attack on Canso and held prisoner at Louisbourg.

On his release, Bradstreet reported the weak defenses at Louisbourg to Gov. William Shirley of Massachusetts and urged him to capture the fortress. In the ensuing successful 1745 expedition, Bradstreet served as a temporary lieutenant colonel in a Massachusetts regiment. He was also appointed commander of the newly captured garrison but was soon forced out of the position amid accusations of profiteering. In 1747, Bradstreet was named lieutenant governor of Newfoundland.

Appointed captain in the 51st Foot in March 1755, Bradstreet was assigned by Shirley to command the bateau service on the Mohawk River. On July 3, 1756, Bradstreet's river convoy, returning after provisioning Oswego, was ambushed by the French. With great coolness, Bradstreet rallied his force and drove off the attack-

ers. In 1757, he was appointed deputy quartermaster general on John Campbell, Earl of Loudoun's, staff. At the Battle of Ticonderoga in July 1758, Bradstreet, who replaced Lord William Howe in command of the advance force, commanded the embarkation area and maintained order following the British defeat.

In July 1758, Bradstreet was granted permission by Major General James Abercromby to lead an expedition against Fort Frontenac, an important French supply depot at the head of Lake Ontario on the Cataraqui River. Bradstreet had long desired to undertake such an enterprise and had repeatedly badgered his superiors on the subject. On August 25, 1758, Bradstreet, leading a force of 3,000 men, made an unopposed landing one mile from the fort. Taking advantage of the surprise achieved, he quickly bombarded the small garrison into submission. After removing the stores, destroying a French flotilla that had been captured, and demolishing the fort, he withdrew. Despite this success, Abercromby rejected his proposals for subsequent and much larger expeditions against the French positions in the Great Lakes region. During Amherst's campaigns against Canada in 1759–1760, Bradstreet again served as deputy quartermaster general at Albany.

After receiving promotion to colonel in October 1762, Bradstreet was appointed to command a punitive expedition during Pontiac's Rebellion in 1763. Leaving Fort Niagara in August 1764 with a force of 1,400 soldiers and 500 Indians, Bradstreet advanced to Detroit. Motivated by his soaring ambition, he far exceeded his instructions and authority by attempting to negotiate a peace treaty with the Native Americans. These peace negotiations were ignored by the natives and disavowed by Major General Thomas Gage. Even after it was obvious that the Shawnees and other natives were still hostile, Bradstreet remained inactive and did not, as directed by Gage, attack and destroy the native villages. Having failed to engage native warriors, Bradstreet abandoned the expedition. Short of supplies and in great confusion, the expedition reached Fort Niagara on November 5.

Although promoted to major general in 1772, Bradstreet's opportunities for advancement disappeared after his poorly conducted Detroit campaign. He remained deputy quartermaster general at Albany until his death at New York City on September 25, 1774.

Brant, Joseph (Thayendanega)

Born: ca. 1742

Died: November 24, 1807

Influential Mohawk leader. Joseph Brant was born Thayendanega about 1742 at an Iroquois settlement in Ohio and was related by marriage to British Indian Superintendent Sir William Johnson. Johnson took an interest in young Brant and groomed him as one of his protégés, arranging for him to be educated with a small group of native youth at Eleazar Wheelock's Indian Charity School.

As a young man, Brant twice visited England and made quite an impression on London society, counting the Prince of Wales among his friends. He was also viewed favorably for his membership in the Masons and for having translated the Bible (and later the Book of Common Prayer) into Mohawk. His last visit to England coincided with the outbreak of the American Revolutionary War. In July 1776, Brant arrived in New York and made his way back to Mohawk country.

Influential Mohawk chief Joseph Brant, also known as Thayendanega. (National Archives)

Brant offered his services to the English Crown, and he led Mohawk warriors in several campaigns, participating in the battles at Oswego and Fort Stanwix in 1777. He also led Mohawk warriors—in the first battle in which Iroquois fought Iroquois—at Oriskany that same year. He also led late the next year during the raid on Cherry Valley, New York.

Along with his effectiveness as a leader, Brant acquired a reputation as a humane warrior. At Cherry Valley, he was said to have protested to the British commander over the killing of noncombatants. Others argued that this reputation was unjustified, pointing out that Brant could be as harsh as any other Native American warrior with his prisoners, expecting them to keep pace with a retreating war party.

As with other Native American allies of the British, Brant was angered by the terms of the Peace of Paris, the treaty that ended the American Revolutionary War. Particularly galling was the signing over of native lands to the Americans. Brant argued that the Americans had beaten the British, not the Iroquois. However, he believed that the Iroquois position was untenable in the new United States. After the Sullivan Campaign of 1779, which had devastated Iroquoia, Brant used his influence to secure reserves for the Mohawks along the Grand River in Ontario and convinced many of his people to move there.

In the 1780s, a native confederacy under the Miami chief Little Turtle defeated American military expeditions led by Josiah Harmar and Arthur St. Clair in the Ohio Country. Brant and other Iroquois leaders recommended that Little Turtle, Blue Jacket, and other leaders negotiate a peace with the Americans that would leave their gains in place. Brant died on November 24, 1807, at Burlington, Ontario.

Brice's Fort (North Carolina)

A rallying point for survivors of an attack by the Tuscarora tribe against European settlements on September 22, 1711. The assault opened the Tuscarora War (1711–1713). Brice's Fort was located in eastern North Carolina and named for the plantation owned by William Brice (?—1753), on whose land the outpost was established. The attack was provoked by colonial incursions onto Tuscarora lands, in particular, an attempt to build a Swiss settlement at New Bern. Hundreds of colonists were killed in raids by the Tuscaroras and their allies.

The survivors fled to a few fortified locations, primarily the town of Bath, where a fort was hastily constructed in the center of the

peninsula. Brice led an expedition up the Neuse River against the natives but was eventually overwhelmed by hundreds of warriors. He then fell back to his fortified plantation (Brice's Fort) to await assistance from neighboring colonies. Not until 1715 were colonial forces able entirely to defeat the Tuscaroras and drive most of them out of the colony.

Brims of Coweta

Born: Unknown Died: ca. 1730-1733

Creek *mico* (headman) and leader of Coweta, the Lower Creeks' most prominent settlement. In the late 17th century, the Creeks were strategically located between the French in Louisiana, the Spanish in Florida, and the English in South Carolina. The nation was comprised of many different towns with individual leaders and encompassed two general areas: the Upper Towns and Lower Towns. The headman of the premier Lower Town, Coweta, was able to bring his people together and direct their diplomacy for several decades. That man was known as Brims, or "Emperor Brims," because of his influence and stature among the Creeks. Nothing is known of the circumstances of Brims's birth or his early years.

After Carolina's founding in 1670, the English slowly made inroads to the interior native tribes. By the 1680s, Indian Agent Henry Woodward had established contact with the Creeks. Anxious to counterbalance Spanish power in the region, Brims created a strong alliance with Woodward and subsequently opened an important economic connection with the English through trade. In August 1705, both the Upper and Lower Creeks cemented the relationship with a formal alliance.

Quickly, however, trade abuses against the Native Americans became so rampant that many of the southeastern natives revolted, leading to the Yamasee War (1715–1717). Brims and the Creeks joined the revolt, which initially favored the natives and almost wiped out South Carolina. But the English eventually regained the upper hand, largely because of prominent allies such as the Cherokees. The English ultimately dispersed the Yamasees, selling many of them into slavery. They concluded peace negotiations with the Creeks in November 1717.

In the years after the Yamasee War, Brims became most known for his policy of neutrality and playoff diplomacy. He was seeking bargaining power for the Creeks and hoping for leverage against the

three European nations. He therefore determined to fight none and court all in an effort to keep the Creeks powerful.

To that end, in 1717, Brims allowed the French to build Fort Toulouse, gave permission to the Spanish to build a fort in Coweta, and received the English and allowed his niece, Mary Musgrove, to marry an Englishman to solidify the alliance. Clearly, Brims planned to keep the Creeks in the good graces of all three European nations, enabling him to play one against the other. Brims directed this policy until his death sometime between 1730 and 1733. Yet even after his death, his successors continued the policy. This allowed the Creeks to remain a power broker in the region throughout the 18th century.

Brookfield, Siege of

Start Date: August 2, 1675 End Date: August 5, 1675

Native American assault on a central Massachusetts town (also known as Quabaug) by the Nipmuck tribe on August 2–5, 1675, in the early months of King Philip's War (1675–1676). The siege demonstrated that additional aboriginal groups besides the Wampanoags, led by King Philip (Metacom), would become adversaries of New England colonists in the conflict. Prior to August 1675, hostilities had involved only the Wampanoags and English colonists and militiamen in the western portions of Plymouth Colony and the eastern area of Narragansett Bay. In addition, attacking warriors attempted to employ a number of siege techniques, demonstrating a Native American facility for technical innovation.

On August 2, 1675, a party of English with some Native American guides left Brookfield to meet with local sachems (chiefs). When the latter failed to arrive at the appointed time and place, the English party went in search of them, and in so doing they fell into an ambush prepared by Nipmuck warriors. The survivors of this attack retreated to Brookfield and, with residents of the town, defended themselves during the ensuing siege in the settlement's garrison house from that evening to the early morning of August 5. The Nipmucks abandoned their assault with the arrival of colonial militiamen, who were notified by a colonist who had crept out of Brookfield in the midst of the siege.

The primary eyewitness account of the siege, written by militia captain Thomas Wheeler, notes that attacking warriors "used several Strategems" to fire the garrison house. During the first day, the

Contemporary engraving of Native Americans attacking Brookfield, Massachusetts, in August 1675. (Library of Congress)

Nipmucks used fire arrows, placed and set alight combustible materials such as flax and hay at the side of the house, and "shot a Ball of wild Fire" at the building. The English defenders checked all these attempts to burn the garrison house, but by the following night warriors had constructed three devices to burn the structure. One was a cart filled with flammable matter and fitted with planks to protect from the colonists' gunfire those Nipmucks pushing the vehicle. The other two devices were made of two sets of poles lashed together and set on small wheels, the front ends of the poles joined by an axle set within a barrel.

Rain helped foil the use of these siege devices on the evening of August 4. That same night, reinforcements in the form of 46 English and 5 natives under Major Simon Willard and Captain John Parker arrived at Brookfield. Warriors constructing the siege engines failed to hear shots fired by scout warning them of the soldiers' approach, allowing Willard and his men to reach the garrison house. The Native Americans subsequently engaged the reinforced English in a firefight but then abandoned the siege in the early morning of August 5.

Buffalo Creek, Attack on Event Date: September 16, 1754

September 1754 raid by French-allied Native Americans against a group of English settlers along Buffalo Creek, north of the Broad River in present-day York County, South Carolina. The attack was precipitated by ever-present Anglo-French rivalries and the increasing numbers of Scots-Irish settlers beginning to impinge on lands controlled by the French-allied natives of the region.

Before the 18th century, the lands beyond the settled English Atlantic coastal strip were largely uninhabited by European settlers. This began to change with the immigration of Scots-Irish, English, and other settlers to the fringes of the English colonial holdings. By the time of the attack on Buffalo Creek, Scots-Irish settlers had ventured into the middle of present-day South Carolina and North Carolina, pressing hard up against possessions nominally held by the French. Small settlements sprang up along the frontier, so far away from civilization and in advance of English policy that military protection was usually precarious at best. One of the largest tribes in the region, the Cherokees, had sided with the English for defensive purposes against their native enemies. However, there was growing Cherokee dissatisfaction with how well the English were performing this task. All indications therefore pointed to a lack of security for English interests and citizens in the area.

On September 16, 1754, so-called French Indians attacked the small settlement at Buffalo Creek. As used by Carolinian settlers, the term "French Indians" referred collectively to Shawnee, Delaware, and Miami Indians, who were allied with France. A raiding party comprised of these tribes attacked the settlement while the frontier women were away celebrating the engagement of a nearby couple. What remained were all of the settlement's men (16 by most accounts) and at least 5 children. All of the men were killed and the children were taken captive, although most were released fairly quickly. Friendly Cherokees managed to return 1 missing child to Gov. James Glen of South Carolina in October 1755.

Glen responded to the attack by seeking support from his Cherokee allies and increasing military protection of frontier English settlements in the region. In 1755, he signed a treaty with the Cherokee Nation that repaired strained English-Cherokee relations and permanently brought the Cherokees under the English Crown. A provision of this treaty was the right of the Crown to construct forts in the region, which ensured the advance of colonial settlement of the frontier.

Burd, James

Born: March 10, 1726 Died: October 5, 1793

Pennsylvania merchant and major in the Pennsylvania provincial forces during the French and Indian War (1754–1763). Born on March 10, 1726, at Ormiston, Scotland, James Burd immigrated to Pennsylvania in 1746, where he became a merchant in Philadelphia. In 1752, he left his merchant business to manage his father-in-law's holdings in the area, now known as Shippensburg.

In 1756, at the start of the French and Indian War, Burd received a commission as a major in the Augusta Regiment of the Pennsyl-

Portrait of James Burd, Philadelphia merchant and militia colonel during the French and Indian War. (Library of Congress)

vania provincial forces. On December 8 of that year, he took command of the regiment after the resignation of Lieutenant Colonel William Clapham. Under Burd's command, the regiment built Fort Augusta (near Shamokin) as well as the Provincial Road, which ran between the fort and Tulpehocken. Burd also laid the foundation for what would be Fort Ligonier in 1758.

That same year, Burd received promotion to colonel and accompanied Brigadier General John Forbes and his British troops on an expedition to capture Fort Duquesne. Burd was sent to the Erie area after the fall of Duquesne to supervise road and fort construction there. He was responsible for defending Fort Ligonier from attack on October 12, 1758. Burd returned to Fort Augusta in 1760 and remained there until the dissolution of the Augusta Regiment.

Between 1764 and 1770, Burd held the office of justice of Lancaster County. In 1774, he was instrumental in garnering local support for the First Continental Congress in its opposition to the Crown. The following year, Burd assisted in the military organization of Lancaster County as a member of the Committee of Safety. He was also elected a colonel of a militia battalion, but he resigned his post in December 1776 because of a dispute concerning rank and insubordination in his command and criticism from the Committee of Safety. Burd served as a county judge until his death on October 5, 1793, at Tinian, Highspire, Lancaster (now Dauphin) County, Pennsylvania.

Burnet, William

Born: March 1688 Died: September 7, 1729

English colonial governor of New York and New Jersey. Born in Den Haag, the Netherlands, in March 1688, William Burnet grew up in a staunch Protestant family. His father, Gilbert Burnet, was an historian and friend of William of Orange, who became William Burnet's godfather. After the Glorious Revolution of 1688 in England, which deposed James II, the Catholic king, the Burnet family accompanied William and his wife Mary, daughter of James, to England. A trusted adviser to the new king and queen, the elder Burnet was rewarded by the bishopric of Salisbury. The young Burnet entered Oxford University at age 13 but was dismissed for discipli-

William Burnet, English colonial governor of New York and New Jersey. (Hulton Archive/Getty Images)

nary reasons. Educated by private tutors, including Isaac Newton, he became a lawyer. Burnet's connections at court brought his appointment as governor of New York and New Jersey in the spring of 1720.

Burnet encouraged the expansion of trade with the Indians, especially the Iroquois, in an attempt to form a strategic alliance against the French. English colonists, who produced many finished goods locally, were able to compete successfully with French traders, who had to import similar goods from Europe. In a further attempt to inhibit French influence in upstate New York, Burnet tried to curtail English trade with the French, much to the chagrin of some wealthy English merchants in New York. In addition, in 1727 Burnet ordered the building of the first English fort on the Great Lakes at Oswego. The significance of his initiatives with the Iroquois was revealed in the French and Indian War when the Iroquois allied with the British against the French.

In 1728, after King George II named his friend John Montgomerie governor of New York and New Jersey, Burnet became governor of Massachusetts and New Hampshire. Much of his short tenure in this post was spent quarreling with the colony's assembly over his salary. Burnet died of a stroke in Boston on September 7, 1729.

Bushy Run, Battle of

Start Date: August 5, 1763 End Date: August 6, 1763

Clash between British and colonial troops, under the command of Colonel Henry Bouquet, and warriors of the Shawnee, Delaware, Mingo, and other Native American groups from the Ohio River and Great Lakes region, 25 miles from Fort Pitt (later Pittsburgh). The Battle of Bushy Run, which took place August 5–6, 1763, on the Pennsylvania frontier, occurred during Pontiac's Rebellion and was arguably the most intensely fought field action of the conflict. Following this engagement, warriors abandoned attacks on and near Fort Pitt.

During the summer of 1763, Native American warriors attacked settlements and isolated garrisons on the Pennsylvania frontier. Fort Pitt (Fort Duquesne before 1758), the largest and most important garrison in the region, was the target of sporadic attacks beginning in June and came under constant fire beginning on July 28, 1763. However, advancing warriors broke off these attacks on August 2 on receiving word of an approaching relief column led by Colonel Bouquet. Three days later, at about noon, warriors ambushed the column's advance guard a mile away from Bushy Run.

Bouquet sent two light infantry companies to support his vanguard. Though the assailants fell back before his soldiers' charges, they simply returned to attack, encroaching on the British force's flanks until they threatened his baggage train. Bouquet took up a position at the top of nearby Edge Hill, which his forces improved by building temporary defensive works with flour bags.

Native American warriors renewed their assaults on August 6. Still surrounded, Bouquet devised a ruse to take advantage of his foes' boldness. He moved two companies off his perimeter, and had nearby units change position as if the first two companies were retreating. Subsequently many warriors rushed through the gap; however, when they were within the British lines, the first two units charged out from a location previously hidden from view and routed the surprised warriors. The latter received fire from other units on the perimeter as they fled, and were then pursued by the charging British troops. The Native Americans who had not fallen into but witnessed the effectiveness of Bouquet's trap also abandoned the fight.

Map depicting the site of the Battle of Bushy Run of August 5, 1763. The fighting occurred durig Pontiac's Rebellion, when Native Americans attacked British soldiers on their way to relieve Fort Pitt. (North Wind Picture Archives)

Although victorious, Bouquet's force sustained heavy casualties. Of about 400 men in the engagement, some 50 were killed and another 60 wounded. Moreover, Bouquet had to abandon and destroy the flour bags intended for Fort Pitt in order to use the pack horses to carry his wounded men.

Caddoes

A Native American nation of scattered autonomous villages and complexes. The Caddo people resided in the entire lower Red River area: much of present-day Oklahoma, Texas, Louisiana, and Arkansas. The Caddoes are believe to have numbered some 8,000 people at the time of first European contact.

The word "Caddo" is a French abbreviation of *Kadohadacho*, derived from the term *kaadi*, meaning "chief." The term identifies both their nation and the language spoken by the Wichitas, Kichais, the Pawnees, and the Arikaras. Spanish references to the Caddoes as *Tejas or Teches*, meaning "friend," eventually became the name of the state of Texas.

The Caddoes were composed of several dozen loosely organized tribes and confederacies, the most important of which were the Hasinais, Natchitoches, Caddo proper (Kadohadacho or Cadodacho), Adais, Eyishes, and Tulas. Mentioned in 17th-century records, the Caddoes were recognized as having controlled their lands prior to Spaniard Hernando de Soto's excursion. Members of his expedition had entered Caddoan territory at Chaguate on the Ouachita River near today's Malvern and Arkadelphia, Arkansas, in June 1541. By 1686, the Caddoes had allied with their old rivals, the Wichitas, and were in conflict with the Choctaws, the Chickasaws, the Osages, and the Tonkawas.

Known as the "Earth House People" for their earthen temples and mounds, the Caddoes were also recognized for having well-established communities and ceremonial centers in small and larger townships. They were basically an agricultural people and had farm-steads along the larger rivers. They did not build fortifications. Their dwellings were circular and both grass-thatched and earth-covered. Around the walls were couches that served as seats during the day and beds at night. They made bows and arrows and hunted deer and buffalo, among other animals. They also fished. In the summer,

many went naked, and in the winter the Caddoes draped themselves in animal skins. They produced pottery and traded salt, conch shells, copper, cotton, and turquoise, which they secured from the Southwest. After European contact, the Caddoes became great horsemen and hunters as their homeland shifted westward.

The French established early their control over all the Caddo tribes, excepting the Adai, where the Spanish had located. In 1714, the French founded a trading post at present-day Natchitoches, Louisiana, and by 1730, there were several hundred Natchitoches dwellings near the post. The Caddoes hoped to remain neutral, trading with both colonial powers, but this proved impossible. In fighting between France and Spain, the Adais particularly suffered, their villages being divided between the two colonial powers.

In the Treaty of Fontainebleau in 1762, France compensated Spain for losses incurred while fighting on the French side in the Seven Years' War (1756–1763) by giving it the Louisiana Territory. This transaction was not completed until 1769, but it produced great anger among the Caddoes, who did not believe the French had the right to cede their land. The Spanish succeeded in winning Caddo loyalty, however, through the fur trade and presents. Caddo chief Tinihiouien, meanwhile, negotiated several treaties ceding land to the Spanish. As with other Native Americans, Caddo landholding rapidly diminished as their own population declined. By the 1830s the remaining Caddoes agreed to give up what was left of their land to the United States and move to Indian Territory.

Caesar

Born: Unknown Died: Unknown

A Cherokee chief of the early 18th century, who was at different times a warrior, a slave trader, and a slave. The precise time and place of his birth and death, his real name, and how he acquired the name Caesar are unrecorded. He evidently had been supplying South Carolina with Native American slaves and capturing runaways when he himself was captured and sold to John Stephens, a Savannah planter, in 1713. At the prompting of Flint, another Cherokee chief, Caesar soon escaped from captivity. The Cherokees offered to pay restitution to Stephens, since their own tradition recognized the enslavement of war captives as a legal right.

In 1714, Caesar and Flint were approached by Eleazar Wigan and Alexander Long, two South Carolina traders who claimed to have grievances against the Yuchis. (The Yuchis are believed to be the people identified in the 17th century as Westoes.) The traders persuaded Caesar and Flint to lead a Cherokee attack against the Yuchi village of Chestowee (Tsistuyi) on the Hiwassee River (present-day Polk County, Tennessee), even though Chestowee was on friendly terms with the colony. The traders would take the captives, who would be sold into slavery, and in return, the Cherokees would have their debts canceled and receive ammunition, powder, and trade goods. Gov. Charles Craven received advance word of the attack but was unable to stop it. Caught by surprise, but unwilling to become slaves, many of the Yuchis killed each other, leaving only one woman and five children to take captive. The incident created a scandal and led to a trial, perhaps the first in the colony in which Cherokee testified. The Cherokees claimed they were told the governor had authorized the operation. Wigan and Long had their trading licenses revoked.

Then, in 1715, the government offered Wigan £500 to persuade the Cherokees to join South Carolina in the Yamasee War. He brought Caesar from Echota, on the upper Chattahoochee, to Charles Town (present-day Charleston, South Carolina) with a delegation of 120 natives. There, Caesar appeared to commit the Cherokees to a joint war effort, but he had no real authority to do so and the warriors failed to appear as promised. Charitey Hagey (known as the Conjuror), a chief from another Cherokee village, took a neutralist position and offered to mediate between South Carolina and the Creeks, an ally of the Yamasees. The colonial authorities, suffering from the war, were intrigued by this offer, but the prospect threatened to undermine Caesar's authority and usefulness as the leader of the pro-British war faction. Yet another faction, little known to the colonists, sought an alliance with the Creeks against South Carolina.

Caesar was apparently instrumental in orchestrating the massacre of a large Creek delegation visiting the Cherokees on January 26, 1716. The brutal act ended the possibility of an accommodation with the Creeks and forced the Cherokese into the war on the side of South Carolina. With the forging of the Cherokee alliance, the Native American coalition fighting South Carolina soon began to unravel.

Cahokia-Fox Raid

Event Date: June 1, 1752

An attack by Fox warriors and their native allies on a Cahokia village—on the banks of the Mississippi River—on June 1, 1752, in present-day Illinois. The inhabitants of the Cahokia village included members of the Michigamea Nation and numbered roughly 400 people, including men, women, and children. The raid was a devastating blow to the Cahokia tribe, driving them further into a state of dependence on the French and weakening their tribal identity.

Allies of the French, the Cahokias had broken a French-sponsored treaty between themselves and their native rivals to the North by trespassing onto non-Cahokia lands for a hunting excursion in 1751. During the trip, the Cahokia party captured and mistreated some members of the Fox tribe. The Fox retaliated the following year with the raiding party of 400–500 warriors from the Fox and other northern tribes. The party filled 60 canoes, which stole past French forts on the Mississippi toward their target.

Taking advantage of the absence of some members of the Cahokia tribe at the Corpus Christi feast held at Fort de Chartres, the nearby French fort, the Fox raiding party attacked. Despite the close presence of the fort, no help was forthcoming from it. The Fox easily took the village, destroying a great part of it and taking hostages. The attackers scalped the dead and abused corpses, both those killed during the raid and those already buried in the village graveyard. The Cahokia hostages remained in bondage for some years with at least a few returning to the tribe after French diplomatic efforts to secure their release.

The raid effectively began the Cahokias' downward spiral toward eventual extinction and removed them from their ancestral area. Unable to recover, reduced to a state of dependency on the fading power of France, and stricken by demographic decline, many of

the remaining Cahokias merged with their culturally close cousins, the Peorias. The Peoria tribe eventually settled in Oklahoma.

Although there is no historical proof, many observers have suggested French duplicity in the raid. The French often portrayed themselves as the protectors of their native peoples against hostile threats, but it was the French who benefited most from this arrangement. The English Crown pressed hard against French possessions in the region, and the French could not afford to have the Cahokia tribe defect to the English side. It would have been to the French advantage to create a situation in which the Cahokias could not collude with their enemies or the English, who had hitherto been associated with native foes of the Cahokias. The existence of this strategy can only be inferred by the French modus operandi in other native areas, the suspicious passage of the Fox raiding party past French forts, and suggestive remarks made by French officials in the region.

California

California, occupying most of the North American coastline along the Pacific, has been home to dozens of Native American tribes and was at various times claimed by Spain, England, Russia, and the United States. Although the Spanish influence in California is undeniable, the extent of that influence was not nearly as far-reaching as has been assumed.

Prior to the European arrival, the region hosted a very large, diverse population of native tribes. The first European to explore the region was Juan Rodriguez Cabrillo, a Portuguese-born captain sailing for Spain. In 1542, Viceroy Antonio de Mendoza of New Spain commissioned Cabrillo to explore the coastline north of Baja California. His expedition ultimately reached as far north as the 42nd parallel, the modern northern border of California. But Cabrillo became ill and died during the voyage.

In 1579, Englishman Sir Francis Drake mapped the entire California coastline while leading a series of raids on Spanish cities along the western coast of the Americas. He renamed the area "Nova Albion"

Contemporary woodcut of a Spanish mission in California showing Spanish padres and soldiers and Native Americans in the early 1700s. (North Wind Picture Awards)

and claimed it on behalf of the English throne. Eventually, imperial Russia claimed the entire region as well, although it expended no significant effort to enforce the claim. For the most part, Spanish explorers abandoned and ignored the area until the late 1700s. Open conflict with native populations remained rare, as the Spanish made little effort to pacify the region by force. Instead, relations with the natives, who numbered approximately 100,000 people at the time of first contact, remained generally amicable and trade driven.

In the 18th century, Spanish missionaries received large land grants and established settlements in California, including those near the present-day cities of Los Angeles, San Diego, San Francisco, and San Jose. An extensive mission system was also begun there. Native Americans converted to Christianity voluntarily, however, and no military units enforced the dictates of the Catholic Church. Spanish missionaries moved into the region gradually, led initially by members of the Society of Jesus (Jesuits).

The Jesuits were allowed autonomy in California, which protected native populations from exploitation by Spanish settlers. Yet this also led to resentment of the religious order throughout the Spanish empire. For that reason, the Jesuits were expelled in 1768 and replaced by the Franciscans, who now ran the various California missions. The expulsion of the Jesuits provoked conflict, however, as many local native groups remained loyal to them and protested the action. In response, the Spanish government executed hundreds of Jesuit loyalists. In 1769, the Spanish launched a military venture, known as the Sacred Expedition, to settle California. This established a series of missions and presidio garrisons but only two secular townships, San Jose de Guadalupe and Los Angeles.

Relationships with native tribes declined after the Sacred Expedition. Father Junipero Serra (1713–1784) noted that soldiers continually abused native women sexually. Meanwhile, military governors quarreled constantly with Franciscan missionaries. The expansion of the Spanish presence in California now included the forcible relocation of natives into the mission system and punishment if they resisted. Spanish diseases wracked the natives and caused a massive decline in their overall population.

In California, unlike Mexico, intermarriage was rare and the populations remained apart. Not surprisingly, conflict with the natives increased with the expanded Spanish presence. Native Americans torched Franciscan missions, and in 1781, the Yuma tribe attacked a Spanish military expedition, killing 30 soldiers and their Franciscan chaplains. The Yuma massacre virtually halted further Spanish migration to California and ensured that a state of war would continue to exist between the Spanish colonists and the indigenous tribes. When Mexico rebelled against Spanish rule and became independent in 1821, California became a Mexican territory. It was ceded to the United States after the Mexican War (1846–1848) and achieved statehood in 1850.

Calusas

Indigenous people who inhabited southwestern Florida from Sarasota Bay to Marco Island, as far southwest as the Florida Keys. By the time of the European arrival, Calusa society was divided into nobles and commoners and spread out over 50 villages. The Calusas flourished on the abundant fishing and gathering available in the area and by collecting tributes from smaller interior villages.

It is likely the Calusas became aware of Spanish incursions into the Caribbean when refugees from Cuba began fleeing into southwestern Florida. The first documented contact between the Calusas and the Spanish came in 1513, when explorer Juan Ponce de León sailed into the mouth of the Caloosahatchee River. For several days, Calusa canoes approached the ship and made tentative overtures of trade. On June 4, 1513, a Spanish-speaking native, possibly a Cuban refugee, approached the ship with instructions from the Calusa leader to await his arrival. Shortly thereafter, the Spanish were attacked by Calusa warriors in 20 canoes. The Spanish rebuffed the assault without difficulty, but on the following day a larger group of Calusas again attacked the ship, and the Spanish decided to withdraw.

Subsequent Spanish explorers met with similarly hostile receptions. The entire Calusa region was infamous among the Spaniards for the poor treatment of shipwrecked sailors, who were usually executed. Ponce de León returned in 1521, when he received a fatal wound during a failed attempt to begin a settlement in the area.

The next substantive contact between the Spanish and Calusas was in 1566, when Pedro Menéndez de Avilés attempted to form an alliance with the Calusas. Menéndez exchanged overtures of friendship with the Calusa leader, known to history as King Carlos II, but both parties were insincere. When several of Carlos's treacheries came to light, the Spaniards had him and his top leaders executed in 1567. Three years later, Carlos's successor was also killed when he ran afoul of the Spanish.

Hostile relations continued between the Calusas and all European colonizers. In 1704, the English encouraged their Yamasee and Uchise allies to destroy the Spanish mission system throughout western Florida. The well-armed warriors also dabbled in slave trading. As they pushed into southwestern Florida, the Uchises and

Yamasees captured many Calusas. The Calusas had deliberately isolated themselves from trade and other relations with the Europeans and were no match for the well-armed invaders. By 1710 only a few hundred Calusas remained in the area, having been decimated through disease, enslavement, and warfare. Some of the Calusas migrated to Cuba, but most of them died shortly after arrival due to disease. By 1750 they had ceased to exist as a distinct society in Florida, although their descendants may have survived and integrated into other tribes in Cuba.

Calvert, Cecilius, Second Lord Baltimore

Born: August 8, 1605 Died: November 30, 1675

First proprietor of the Maryland Colony. The eldest son of George Calvert, First Lord Baltimore, Cecilius Calvert was born on August 8, 1605, in London. He followed in his father's footsteps at Oxford University's Trinity College, earning a degree there in 1623.

On his father's death in 1632, Cecilius Calvert inherited the title of Second Lord Baltimore and the daunting responsibilities of establishing a colony north of Virginia, named Maryland for the queen, Henrietta Maria. Like his father, he believed it feasible to be both English and Catholic at a time when the forces of monarchy and Parliament were increasingly clashing over sectarian issues. Concerned with protecting Maryland's interests with the British court in London, Cecilius opted to remain in England and appoint his brother, Leonard, as the first colonial governor. Cecilius's parting instructions to his brother evolved into the framework for the Maryland legal system.

The Protestant-dominated London Company posed the greatest threat to Maryland's future as its shareholders schemed among its political allies. Cecilius was determined to continue his father's commitment to religious freedom as Protestants and Catholics were encouraged to join the first expedition to Maryland in 1634. Opponents argued to no avail that this spiritual flexibility would attract so many settlers as to drain other colonies of manpower.

Maryland became a model for self-government in the Western world as Cecilius retained only the right of absolute veto, which he seldom employed. The English Civil War (1642–1649) placed the heaviest strain on his stewardship of the colony. Despite the pres-

sure to abandon the ill-fated Charles I and align himself with Parliament as the most expedient path to protecting his charter, Cecilius clung to royalist principles. Yet he cultivated alliances in Parliament to establish himself as a man of reason. When Leonard Calvert died in 1647, Cecilius named a Protestant successor as a means of assuaging Parliament.

Calvert temporarily lost control of the colony when Puritans affiliated with the virtual dictator Oliver Cromwell compelled his governor to resign in 1655 before order was restored two years later. Cecilius also dealt with Catholic grievances in the form of Jesuits, who expected similar legal and financial privileges as enjoyed in officially Catholic nations. Calvert finally hammered out a compromise to maintain a relative degree of harmony.

With the Stuart monarchy restored in 1660, Cecilius dispatched his only son, Charles, to serve as governor. Cecilius died in London on November 30, 1675, having spent 42 years as the proprietary governor of Maryland without ever setting foot on its soil. Nevertheless, his strategic vision, steadfast hand, and fair-mindedness had seen the colony through its most uncertain years.

Calvert, George, First Lord Baltimore

Born: ca. 1580 Died: April 15, 1632

Progenitor of the Maryland Colony and a pioneer in the quest for religious freedom in the Western world. The son of a minor British gentleman, George Calvert was born in Yorkshire about 1580. He graduated from Trinity College at Oxford in 1597 and served as private secretary to Sir Robert Cecil, clerk of the Privy Council. After brief clerkships in Ireland, Calvert won a seat in Parliament in 1609, where he served several nonconsecutive terms.

Succeeding to Cecil's post on the death of his patron, Calvert grew close to King James I. Knighted in 1617, Calvert was appointed one of the king's principal secretaries of state. He lobbied among the minority in the British government who favored gravitating toward the Spanish over the French. A convert from Anglicanism to Catholicism in 1624, Calvert announced his new faith and therefore rendered himself ineligible to work in Parliament or at the highest levels of the royal administration.

The final straw in this momentous decision was reached when Calvert was expected to put on trial for sedition those who refused

George Calvert, First Lord Baltimore, English political leader, founder of Maryland, and pioneer in religious freedom in the New World. (Frank Grizzard)

to attend the services of the Church of England and recognize its authority. James I consequently elevated Calvert to the Irish peerage as Baron Baltimore of Baltimore in County Longford, along the southern coast of the island. When James died in 1625, his successor, Charles I, was willing to allow Calvert to remain on the Privy Council without taking the oath of supremacy, which acknowledged the king as the ultimate religious and civil authority. But Calvert declined out of a growing disenchantment with public life.

Eager to pursue overseas ventures, Calvert invested in both the New England and Virginia companies. Most anxious for an opportunity of his own, Calvert purchased a plantation and charter with virtual royal authority for Newfoundland in order to create a province that would allow freedom of worship. Dubbed Avalon, this land would include the first Catholic ministry on English soil in North America.

Calvert visited Avalon in 1627–1628, but it suffered substantially from bitter weather and raids by French privateers. He then petitioned Charles I for a new grant in a more temperate climate. At first, he received rights to territory south of the James River (in Virginia), but the demand from Protestants in the Virginia Company for Calvert to take an oath of supremacy frustrated his efforts.

Finally, in late 1631, Calvert received a large grant of land north of Virginia to be named Maryland in honor of the queen, Henrietta Maria. Calvert was particularly excited over the commercial prospects of what would be known as Chesapeake Bay. The original grant extended from the Potomac River north to New England, but a subsequent charter for Pennsylvania limited Calvert's holdings.

Calvert secured the right to provide land to colonists regardless of religious orientation. He died in London on April 15, 1632, before the royal charter had been finalized. His son, Cecilius, Second Lord Baltimore, carried out the initial colonization of Maryland as the first settlers arrived in 1634.

Campbell, John, Earl of Loudoun

Born: May 4, 1705 Died: April 27, 1782

Commander in chief of British land forces in North America (1756–1757) and governor of Virginia (1756–1757). John Campbell, Fourth Earl of Loudoun, was born in Ayrshire, Scotland, on May 4, 1705. He was the only legitimate son of accomplished statesman Hugh Campbell, Third Earl of Loudoun. At the age of 22, Campbell secured a coronet's commission in the Scots Greys. He attained field grade as lieutenant colonel of the 3rd Foot Guards in 1739. By this time, Campbell was already adept at handling both military and political responsibilities. He had succeeded his father to the family title in 1731 and began attending Westminster as 1 of Scotland's 16 representative peers in 1734.

Throughout the next decade, Loudoun demonstrated to the House of Hanover his reliability. After the heavy losses suffered by the British in the 1745 Battle of Fontenoy, the earl was commissioned on June 8, 1745, to raise a regiment of 1,250 men to augment British forces in Flanders. The battalion was scattered between its recruiting centers at Perth and Inverness when Prince Charles Edward Stuart's banner was unfurled at Glenfinnan on August 19, 1745. Campbell's unit provided yeoman service against rebel clansmen throughout the insurrection, with three of its companies participating in the Battle of Culloden on April 16, 1746, which permanently ended the dream of a Jacobite restoration. Thereafter, the Highland regiment was transferred to the Continent, where it served with the Duke of Cumberland's army until its disbandment in 1748.

The Scottish aristocrat's constancy had placed him in good stead with the Crown when the French and Indian War erupted in 1754. The need for a competent general and a strong authority figure to direct military operations overseas led to Loudoun's 1756 selection as successor to Major General William Shirley. Named captain general and governor in chief of Virginia, he was in March 1756 appointed commander in chief of British forces in North America. Campbell arrived at New York on July 23, 1756.

Campbell quickly moved north to Albany with his line regiments to stabilize the northern frontier following the French capture of Oswego on August 14, 1756. He spent the winter months reorganizing the army's administration, logistical infrastructure, and training. He also began planning for an offensive against Quebec via the St. Lawrence River.

Loudoun led a regular force of 13 battalions to Halifax at the beginning of 1757. There they underwent a rigorous course of training before proceeding. French naval superiority at Louisbourg, however, precluded the British descent and caused Campbell to order a return to New York without making an attempt to take the French citadel. Campbell's concentration of forces for the Louisbourg operation, however, permitted French major general Louis-Joseph, Marquis de Montcalm to capture and destroy Fort William Henry in August.

Loudoun was planning an ambitious winter strike against the French at Fort Ticonderoga but was recalled to London on December 30, 1757, because of perceived lethargy in the British North American forces. His second-in-command, Major General James Abercromby, replaced him. Loudoun sailed from New York in April 1758, bequeathing to his successors the trained men and materials they later used to conquer Canada.

Loudoun remained a consequential figure in establishment circles, subsequently commanding the British expeditionary forces to Portugal in 1762. He died at his ancestral home, Loudoun Castle, Ayrshire, Scotland, on April 27, 1782.

Camp Carlisle (Pennsylvania)

Military fort located near Carlisle, Pennsylvania. Camp Carlisle, which began as a fortified camp in western Pennsylvania, is sometimes referred to as the "camp near Carlisle" in contemporary accounts. Although there was a settlement at Carlisle for some time, no permanent garrison existed in the town until a post was established there during the French and Indian War (1754–1763). The

camp, which developed into more of a fort, became an important concentration point for supplies and troops during the conflict.

As early as 1730, a crude fort existed near the town of Carlisle. Such a development occurred naturally because the place occupied an important strategic point in that it lay on the juncture of the north-south and east-west routes of the Indian trade. By the 1750s, however, this earlier post, long abandoned, had all but disappeared.

The first in a series of continuous posts was established at the site on May 30, 1757, with the arrival of a mixed force of British and provincials under the command of Colonel John Stanwix. This came in direct response to the failure of the British assault on Fort Duquesne, led by Major General Edward Braddock, which left the Pennsylvania frontier open to attack. Soon Stanwix had his men digging new entrenchments on the site.

In May 1758, a large depot was constructed at Carlisle. Barracks and storehouses were then added, leading to the present-day name of Carlisle Barracks. Eventually the post became the most secure British position in the West, serving as a supply station and head-quarters for operations during the French and Indian War. In this capacity, it was a key part of the logistical network for operations on the frontier. After the end of the French and Indian War, Carlisle became an armory for the manufacture of arms and ammunition in 1769. The post served an important role in the American Revolutionary War and remains in use by the U.S. Army.

Canada, British Expedition against

Start Date: 1709 End Date: October 1709

Failed British attempt to seize Canada during Queen Anne's War (1702–1713). Since 1702, Queen Anne's War had escalated from Native American raids and counter raids along the New England frontier to some moderately sized military undertakings. This was because the colonials, in spite of what they considered near official neglect by Great Britain, were marshaling and committing increasing numbers

of troops and resources raised on their own initiative. Moreover, a destructive French/native raid on Haverhill, Massachusetts, in 1708 convinced many leaders that only the conquest of Quebec and the expulsion of the French would ensure regional security.

To best facilitate such a large-scale endeavor, it was incumbent on the reluctant British government to reinforce the colonial effort with regular troops and warships. In 1708, Samuel Vetch, an enterprising merchant and former Scottish military officer, traveled to London to confer with the Board of Trade. There Vetch convinced the board of the need and possibility of capturing Canada at relatively little cost and great benefit to the empire.

Vetch resurrected a two-pronged scheme first attempted in 1690 by Sir William Phips. It featured a large amphibious foray down the St. Lawrence River against Quebec City in concert with a sizable overland offensive. The land campaign, to be undertaken by colonial militia, would march up the St. Lawrence River Valley to take Montreal. Vetch argued that, given the weakness of the French position, relatively few British troops (perhaps 5,000 men) and a handful of warships were all that was required to win the continent.

Board members were impressed by Vetch's presentation. And so on March 1, 1709, the Whig administration granted authorization for the campaign and pledged the needed troops and warships. What ensued, however, was basically an exercise in futility based on local shortcomings and conflicting imperial prerogatives.

Significantly, the leader chosen to spearhead the overland thrust against Montreal was Colonel Francis Nicholson, a figure of considerable renown in colonial military and political circles. He possessed wide-ranging administrative skills from governing New York and Virginia, and he was regarded as a competent military leader. Throughout the spring and summer of 1709, Nicholson labored to assemble a diverse force of 1,500 colonials gathered from New York, New Jersey, and various New England colonies. Such an effort was no mean feat, however, as their independent-minded leaders rarely cooperated, even in matters of mutual concern.

By August 1709, Nicholson's force was in place at Albany and proceeded marching north. En route they were joined by four tribes of the heretofore neutral Five Nations of the Iroquois Confederation, which added another 1,500 warriors to his roster. The allies continued working their way through the dense wilderness, simultaneously building a road to facilitate the transit of supply wagons. The offensive now paused at Wood Creek at the southern tip of Lake Chaplain. Concurrently, intelligence of this move completely unnerved French governor-general Philippe de Rigaud de Vaudreuil, who dispatched a force at Scalping Point (Crown Point), New York, to block their passage.

Despite his best efforts, however, Nicholson could not prod his men further. He failed to surmount endemic supply shortages and disease began seriously to dilute his troop strength. Colonial troops then began squabbling with British regulars, and the natives, sensing the confusion and paralysis, began drifting away back to their villages. By September, Nicholson's litany of problems proved both demoralizing and intractable, so he unceremoniously cancelled his participation in the two-pronged strategy.

Events at Boston were equally disheartening to this ambitious endeavor. Vetch, now a colonel, had assembled a force of 1,200 enthusiastic colonial volunteers fired up by the prospects of plunder and the anticipated arrival of a British fleet conveying 4,000 British troops. Unfortunately, this was not meant to be. The British government had begun peace negotiations in Europe and was not prepared to spend lavishly in money and lives for the conquest of Canada only to have it returned to France at the negotiating table. By October 1709, which was far too late to commence a campaign in Canada with any prospects of success, word was received of the expedition's cancellation.

At this juncture both Vetch's and Nicholson's respective forces disbanded and departed for home. New England leaders in particular were disgruntled by what they considered London's broken promises followed by an arbitrary denouement after considerable local funding and effort had been expended. Yet the 1709 Canadian campaign is significant for two reasons. First, it exposed the military establishments in New York and New England to the intrinsic advantages of strategic cooperation against a common enemy. Second, this was the first time in colonial history that the government of Great Britain expressed any desire to commit regular forces to the defense of its colonies, particularly on so large a scale. For the colonials, perhaps the greatest lesson of all was the dire necessity of leaving an agent in London to both articulate colonial interests and promptly transmit all royal decisions concerning defense. Failure in 1709 also prompted Vetch to again visit England and appeal for greater British involvement in the prosecution of the war. A year later, his efforts bore fruit in the 1710 conquest of Port Royal, Acadia.

Canada, British Expedition against Event Date: 1711

Britain's largest and most conspicuous failure during Queen Anne's War (1702–1713) involving an attempted invasion of French-held Canada. Following the easy conquest of Acadia in 1710, noted colonial administrator and soldier Colonel Francis Nicholson arrived in London to push for a greater British commitment of manpower and

resources in prosecuting the war against New France. In 1709, the government had pledged a sizable military and naval contingent, only to deploy them against France at the last moment. The government was now controlled by the Tories under Henry St. John, who viewed the prospects of dramatic military success and its attendant political bonuses favorably. That fact, along with the opening of secret peace talks and a diminished military commitment on the continent, allowed the British to assemble what, by colonial standards, was a huge expedition.

Ultimately, the government authorized a force of 15 warships mounting some 900 guns and 40 transports, all manned by 5,000 men. Sir Hovenden Walker, recently promoted to rear admiral of the White, had command. The transports were to convey 4,500 soldiers, including many veterans of Lord Marlborough's campaigns, commanded by Brigadier General John Hill. Significantly, this was the largest military operation conducted in North America up to that time, and the first launched directly from England against Canada.

To deceive the French of his intentions, Walker's expedition was allotted only three months of provisions, the amount French intelligence would expect the British to put together for a Mediterranean foray. Once in North America, the admiral's efforts were to be abetted by an overland thrust commanded by Colonel Nicholson leading a mixed force of New York, New Jersey, and Connecticut militia up the Hudson River Valley—Lake Champlain route to seize Montreal. Considering the relative weakness of defenses in New France, the prospect of a complete and overpowering victory appeared promising.

No sooner did Walker's armada appear at Boston Harbor on June 24, 1710, an event that astonished the populace, than it quickly wore out its welcome. The decision to supply the fleet with only three months of rations placed the entire effort at the mercy of local provisioners, who turned out to be both avaricious and uncooperative. Considerable friction then arose between British and colonial authorities over the matter of securing food supplies from an already hard-pressed populace. Walker was allegedly so angered by the Bostonian habit of encouraging sailors to desert that he threatened to impress locals into the Royal Navy to make up any losses. Gov. Joseph Dudley, meanwhile, was hard pressed both to accommodate the fleet and to raise two regiments of provincials at local expense. Worse still, the admiral had been led to expect that the city was teeming with experienced pilots who knew and understood the waters of the St. Lawrence River. Few, if any, were forthcoming, and the admiral was forced to hire the captured captain of the French vessel, the Neptune, to guide his fleet. Thus situated, it was not until July 30 that Walker was able to depart Boston, much to the relief of the locals.

Walker encountered adverse winds during his approach to the St. Lawrence. Thus, it was not until August 22 that the fleet entered that river's mouth. Progress was slow owing to a thick enveloping fog that made transiting the river, with its numerous strong currents, especially hazardous. Walker was completely flummoxed as to his precise position, as were his handful of pilots. Believing his ships close to the south shore, he ordered all ships anchored that

evening, pointed south. On being informed land had been sighted and without asking where, he consequently reversed this deployment. That evening the winds blew up and Walker was alerted in the middle of the night that breakers had been sighted. The admiral initially haughtily dismissed the alarm, was warned again, and then made his way to the top deck, bedecked in his evening gown. Breakers were indeed sighted as the winds pushed the entire armada toward the north shore of the St. Lawrence.

Walker now ordered the fleet hard about, which was expertly accomplished under trying conditions. All his warships escaped damage. However, eight of the less-nimble transports struck ground and were broken up. By dawn of August 23, no less than 900 men had drowned, including 200 sailors.

Walker, shaken by the turn of events, then convened a council of war that voted to terminate the expedition altogether. The entire British fleet then unceremoniously sailed for England and the colonial transports returned to Boston. Word of the expedition's timorous ending shocked public opinion. In fact, when Colonel Nicholson, marching hard from Albany with 2,000 men, was apprised of Walker's decision, he reputedly tore off his wig and stamped on it.

Under more capable leadership the conquest of New France might have easily transpired, considering the disparity of forces involved. Nevertheless, in the end the British had to be content with their 1710 conquest of Acadia. The entire effort certainly marked a low point in Royal Navy leadership. A new Whig regime subsequently discharged Walker from active duty in 1720.

Canada, British Expedition against

Start Date: May 1746 End Date: 1747

In the summer of 1745, after inspecting the recently captured French fortress of Louisbourg, Gov. William Shirley of Massachusetts communicated future British plans for Canada with the old colonial slogan "Canada delenda est" (Canada must be destroyed). Shirley revived plans to invade overland to Montreal while launching a naval

assault and amphibious landing at Quebec, notwithstanding the complete strategic failure of a similar plan in 1690. This effort was part of a wider conflict known as the War of the Austrian Succession (1740-1748) within which King George's War between France and Britain had commenced on March 15, 1744. The British arm of the invasion force began to assemble in Spithead, England, on April 9, 1746, and consisted of 20 warships under Admiral Richard Lestock and six regiments of British regulars commanded by Lieutenant General James St. Clair. This force aimed to link up with colonial commander William Pepperell's troops and British commodore Peter Warren's marines in Louisbourg before sailing up the St. Lawrence River for the assault on Quebec. At the same time, about 7,000 colonial troops under Gov. William Gooch of Virginia were to attack Montreal from Albany. The British reasoned that New France, already reeling from the loss of its maritime possessions, would be in no shape to defend against such a concerted invasion.

Ready to depart by May 1746, the British expedition was delayed first by bad weather and then by the menace of a French fleet under the command of the Duc d'Anville. With about 100 vessels carrying almost 10,000 men, the French fleet threatened to turn the tide of war in North America, but it was so ravaged by storms, pestilence, and famine that it did not even get the chance to fire a shot during the entire campaign. Although this French counterstroke failed miserably, the mere existence of this force struck such panic in London and the British colonies that the Canadian invasion plan had to be postponed. It was eventually cancelled outright on January 12, 1747. Furthermore, the threat had required British admiral Isaac Townshend to lift the St. Lawrence blockade, opening the way for French supply ships to reach Quebec. It is almost certain that Canada would have faced a massive Anglo-American assault in 1746 had it not been for d'Anville's fleet.

In Quebec, Gov. Claude de Beauharnois had been preparing for a British invasion since 1745 and was soon launching preemptive strikes against the British colonies. In November of that year, his forces struck south against Saratoga, New York, and in 1746, a contingent of Canadian militia and allied natives overcame Fort Massachusetts and pillaged as far as Deerfield, Massachusetts. Canadian forces also tried to link up with d'Anville in Acadia, but the failure of the French admiral to appear at Beaubassin forced their withdrawal to Quebec. Yet these forays had alarmed the British colonies enough to cause the suspension of the Montreal invasion, which by this time had already bogged down on its own accord. After the Battle of Grand Pré ended in disaster for the British on February 12, 1747, the colonial arm of the invasion of Canada, like its British naval counterpart, would also be permanently shelved.

With the approach of spring, what remained of the d'Anville fleet was relaunched, and again caused consternation in Britain and the colonies entirely out of proportion to the actual threat it posed. Although Admiral George Anson's British forces destroyed the fleet on May 14, 1747, only four days after its embarkation, the British blockade had once more been drawn away, allowing several French

supply ships to reach Quebec. Notwithstanding this qualified success, the defeat of the French fleet by Anson removed any threat from that quarter, making further supply shipments or even communication between France and Canada virtually impossible. But just as in 1746, the British failed to press their advantage.

By the end of 1747, the conflict between the British and French in North America was essentially stalemated, but it did not officially conclude until the signing of the Treaty of Aix-la-Chapelle on October 18, 1748. Britain's subsequent establishment of Halifax would counter Louisbourg (which had been returned to France) in the east, and American land speculation accelerated the erosion of New France's native alliances in North America. But the golden opportunity to take Canada in 1746–1747 had nevertheless been squandered. The French and Indian War (1754–1763) could possibly have been avoided had the British successfully implemented their planned invasion of Canada in 1746.

Canada, New England Expedition against

Start Date: July 1690 End Date: October 15, 1691

New England expedition against French-held Canada, the first major military conflict between the British and French in North America. The mission involved the attempt by two colonial forces mustered mainly from Massachusetts, New York, and Connecticut to mount simultaneous attacks against New France at Montreal and Quebec. An overland army under Fitz-John Winthrop of Connecticut set out for Montreal in mid-July 1690, but because of sickness,

disorganization, and poor leadership, the expedition bogged down at Wood Creek, near Lake Champlain. Out of 1,700 militia and allied natives in the initial force, only about 100 Iroquois warriors and 30 New Englanders commanded by Captain John Schuyler even made it to the vicinity of Montreal, where they skirmished ineffectively with the French at La Prairie before turning back to Albany.

Indeed, ill fortune and numerous logistical problems characterized the entire operation. Major General Sir William Phips, future Massachusetts governor and commander of the naval arm of the expedition aimed at Quebec, was not made aware of the failure of the land campaign. Phips had been waiting impatiently in Boston for supplies and reinforcements from Britain. These did not arrive until 1691, and by late summer the impending change of season and the exigencies of the coordinated strategy compelled Phips to act. Having presided over the decisive assault on Port Royal in Acadia earlier in the year, Phips remained confident that his plan for an amphibious assault on Quebec, despite prior setbacks, would also be successful.

Departing from Boston and sailing up the eastern seaboard, Phips expected to meet only token resistance at Quebec, on the assumption that the Canadians would be tied up in Montreal. Even before their arrival, however, the 32 warships and almost 2,500 troops under his command were ravaged by storms and swept by smallpox outbreaks, considerably reducing their effectiveness. During the voyage, the weather was so unseasonably poor that the normal three-week trip to Quebec took more than two months to complete. Even without such problems, many of the demoralized militia on the ships had mustered only reluctantly, as they were required to provision themselves with everything from cutlery to clothing to armaments.

Further complicating matters, Quebec governor Louis de Buade de Comte de Frontenac had learned of the breakdown of the Montreal assault and arrived from upriver on October 4 with several hundred troops, just as Phips was drawing within sight of the Quebec heights. French defenses at Quebec were further supplemented that evening by the arrival of Louis-Hector de Callière, the governor of Montreal, with another 700 soldiers and *coureurs de bois*. Instead of engaging about 200 troops, which were all that had been present at Quebec only days before, the British invasion would be facing more than 2,700 French soldiers, Canadian militia, and allied natives by the time hostilities commenced. With the plan for a two-pronged assault in tatters, the element of surprise negated, and his forces both outnumbered and decimated by rough seas and pestilence, Phips's arm of the New England expedition against Canada was doomed before it had even really begun.

Nevertheless, on reaching Quebec on October 6, Phips sent an envoy, Major Thomas Savage, to deliver a bombastic surrender demand to Frontenac, who famously retorted, "I have no reply to make to your general other than from the mouths of my cannon and muskets." At this the battle was joined, and on October 8, Lieutenant General John Walley, Phips's second-in-command, landed with 1,300 troops on the Beaufort flats, a muddy shoal north and east of

the heights of Quebec, near the intersection of the St. Lawrence River and St. Charles River. Phips had planned to march these troops across two fords on the St. Charles that were accessible only at low tide. However, not only were Frontenac's cannon sighted in on these passes, but the Canadian militia, under cover of the nearby woodlands, continually harassed Walley's troops. This gave Frontenac the time over the course of the next few days to set up an entrenched force along the Quebec side of the St. Charles, effectively stalemating the American beachhead for the duration of the conflict.

Phips simultaneously bombarded the town from his fleet below Quebec, but little damage was done. The nuns at Quebec's Hotel-Dieu, seemingly not affected by the bombardment, gathered up the American cannonballs that had fallen in their garden and delivered them to the French gun positions, from where they were fired back at their original owners. Most significantly though, the bombardment brought no relief from enemy harassment to the landing force, which was by now recumbent from the exponential spread of smallpox. To add insult to injury, Phips's flagship, the Six Friends, was nearly dismasted by return fire, and his colors, having been knocked into the St. Lawrence, were grabbed by Canadian militiamen in a canoe who had paddled out under fire specifically to retrieve the prized war trophy. By October 15, with his fleet severely damaged and his land forces neutralized, Phips was compelled to withdraw. Because of their vulnerability to counterattack, Walley's disease-ravaged troops reembarked in a panic, leaving behind several large guns and a host of other equipment, much to the benefit of the French. Limping their way back to Boston, the colonists lost four ships and hundreds of men to storms, French naval forces, and disease. On arrival, the virulence incubated by the surviving troops was communicated throughout New England, resulting in the deaths of hundreds more.

The expedition of 1690 took place not only within the context of King William's War (1689–1697) between England and France but also during the time of the Beaver Wars (1641–1701), which saw New France and its native allies matched against the Iroquois Confederacy.

It also came at a time of a strong religious revival in the British colonies, pushing anti-Catholic sentiments to new heights. In a prevailing atmosphere that would shortly spawn the Salem witch hunts, both political and public sentiment increasingly favored a strike against French Canada. Couched as the putative expedition of a holy war against the "antichrist," structural and financial concerns that traditionally weighed against major colonial military operations were quickly set aside.

The failed New England expedition against Canada had significant impact. First, because the effort was financed on credit with the thought that plundered riches from Quebec would balance the ledger, Massachusetts, the major creditor, was nearly bankrupted. The dissension created throughout the colonies was enormous, as it was between the colonial governments and the British metropole, which used the financial crisis to reinstall direct rule in formerly recalcitrant Massachusetts in 1691. Second, the failure pointed to the enormous difficulty of attacking Canada over land, a reality that

94 Cannon Founding

British and colonial military planners would be forced to countenance throughout the colonial period and beyond. Third, the ignominious defeat severely disrupted native-European alliances in North America, leading the Iroquois Confederacy toward a policy of neutrality in French and British conflicts, rather than lending active support to their traditional Anglo-American allies as had formally been the case. Finally, Canada became the direct benefactor of British losses and the alliance disruptions.

By 1701, the French had secured a relatively stable peace with the Iroquois Confederacy, allowing for unprecedented population growth and economic expansion. After going into the war as an isolated colony in the St. Lawrence Valley, New France emerged from the Treaty of Ryswick of 1697, which ended the hostilities between the English and French, in possession of the North American interior from Hudson Bay to the Gulf of Mexico. In large part because of the failure of the New England expedition against Canada in 1690, France continued as a major contender in North American colonial affairs for another 70 years.

Cannon Founding

In the colonial period, guns were made of both bronze (90 percent copper and 10 percent tin) and iron. The process of manufacturing cannon was time consuming, expensive, and required highly skilled workmen. For all of these reasons, and the passage of legislation to prevent their manufacture locally, virtually all cannon present in colonial North America were cast in Europe.

In 18th-century procedure, a pattern for the finished gun was built on a wooden core or spindle. The spindle was wrapped with rope to approximate the size of the finished gun and then covered with a clay mixture. This was turned on its axis and shaped to conform to the gun pattern. Next, a clay mold was applied over the pattern in sections, then the inside wooden core was knocked loose and the rope unwound. Finally, this hollow mold, conforming on the inside to the desired shape of the gun, was inspected, cleaned, dried, and made ready for casting with its several sections bound together. Up to the early 18th century, the guns were cast hollow with a core placed in the barrel mold. This core, consisting of iron wire and clay over an iron spindle finished to the diameter and dimensions of the intended bore, was removed after casting.

In 1715, in Bergdorf, Switzerland, Johann Maritz introduced a new system of manufacturing cannon, a technique his sons soon took to France and Spain. Instead of the gun being cast around a core the size of the bore, the guns were cast solid with the cascabel, or rear of the gun, facing downward. This technique resulted in greater density of metal at the breach, where the shock of discharge was greatest. The bore was then cut out horizontally while the guns were turned on their axes. Turning the gun instead of the cutter produced a cannon bored true to its axis and a smoother and more accurate bore. This system was greatly improved on by Jan Verbruggen of the Netherlands, who introduced a combination boring machine and finishing lathe. Verbruggen, with his son Pieter, later headed the foundry at Woolwich, England. There they established in the 1770s perhaps the finest boring equipment in Europe. The technique of boring in the solid was probably not introduced in America until after the American Revolutionary War.

By 1750, sand molds had come into use in the casting process. The form of the gun was obtained by impressing a pattern in sand and then withdrawing it. The pattern was made of well-seasoned hardwood or, for greater durability, metal. Hollow patterns of iron or bronze, turned and polished in a lathe, could be used for years and would produce guns of uniform size and shape, but they were expensive. The disadvantage of wooden patterns was their vulnerability to weather; they contracted in heat and expanded in humidity.

In the sand-casting process, sand was packed around the pattern, which was contained in a box divided into two or more parts for ease of withdrawal. The pattern itself was made of five or more pieces. The first part comprised the body from base ring to chase ring. The second comprised the muzzle swell and sprue (or head), the third the breech, and the fourth and fifth the trunnions, the lugs on either side of the gun that supported it in its carriage.

The sprue was an additional length given to the gun. Its purpose was to receive slag as it surfaced and to furnish any extra metal required as the cast shrank in cooling. Its weight was thought to compress metal in the cannon proper, increasing the density of lower portions of the gun where the strain was greatest during firing. A square projection further lengthened the breech. This enabled the gun to be held while it was turned and bored.

The flask, the wood or metal box containing the sand, consisted of several pieces, each of which had perforated flanges so they could be bolted together. To form the mold, the pattern for the sprue and muzzle was coated with pulverized charcoal or coke moistened with

clay and water to prevent adhesion. The pattern was then positioned vertically, carefully surrounded by corresponding parts of the jacket. Previously prepared sand—also moistened with water and clay for adhesion—was then rammed around the flask. The pattern for the body of the gun was placed on top of this, and corresponding pieces of the flask were secured and filled in succession with the molding composition. Patterns for the trunnions and rimbases were bolted to the pattern for the body, the bolts being withdrawn once the flask had been packed with sand. End plates were then screwed onto the trunnion molds. The rest of the mold for the body was finished section by section. After the pattern for the cascabel had been installed, the mold was complete.

The pattern was carefully covered with coke wash, and dry sand was sprinkled on top of each piece of the jacket to prevent adhesion and allow portions of it to be separated. A channel was also made in the mold cavity for the introduction of metal. When the mold was completed, the flask was taken apart and the pattern withdrawn. After inspection, any damaged part of the mold was repaired. The interior was then coated with coke wash. The parts were placed in an oven to be gradually dried, and then carried to the pouring pit, where they were joined together and secured in a vertical position, usually breech down. Meanwhile, the interior of the mold was inspected and covered with coke wash to prevent sand from adhering to the melted metal.

After being placed in the pouring pit, the flask was surrounded with sand, which filled the pit as high as or higher than the trunnions. This prevented too rapid cooling. The metal was poured into the prepared channel of the mold. In short guns, this was from the top; in long guns, where the fall of metal might damage the mold, it was from the bottom. As molten metal rose in the mold, a workman agitated it with a long pole, sending impurities to the surface but preventing them from entering the trunnion cavities.

The gun was then allowed to cool. In the case of a 24-pounder, the sand was not removed from around the flask for three days. With heavier guns, it was allowed to remain longer; with the 10-inch columbiad, for example, it might be as long as seven to eight days. Once the metal had cooled, the sand was removed. The gun, still in the flask, was hoisted out. The flask was then taken away and the gun cleaned of sand.

The gun was now ready to be bored. This was the most important and time-consuming part of the manufacturing process. It took 6 to 10 days, depending on the hardness of the metal, to bore a 24-pounder. The gun was carefully positioned in a rack to keep the axis perfectly horizontal. Machinery for revolving the gun was attached to the square knob on the cascabel. The sprue was first cut off by turning the gun and bringing a cutter to bear from the side.

A succession of cutters were fixed to the boring rod. The first of these, known as the piercer, was used until it reached the end of the bore. A second cutter, the reamer, drilled to the rounded bottom of the bore. If there was to be a chamber, the reamer bored only to its edge; a chamber cutter then shaped that portion of the bore. The piercer was not required if the gun was cast hollow around a core.

The exterior of the gun was turned during the boring process, except for the portion between trunnions. This was planed later with another machine. The trunnions were also turned. Care had to be taken that the trunnions were the same diameter, perfectly cylindrical, and that their axes were perpendicular to the axis of the piece. The vent was bored by hand or machine.

As is no doubt apparent from the above, the process of producing cannon was a long one. Even by the mid-19th century, it took three to four weeks to make a 24-pounder and six weeks to make a 10-inch gun.

Finally, before being accepted into service, all guns were inspected and test fired. First they were tested for preponderance (excess of weight behind the pivotal axis) and subjected to a minute examination to see if they were without flaw and conformed to the drawings furnished to the founder. External measurements were made, and the length and exact diameter of the bore calculated. The bore was also examined for cavities with a mirror. Then an instrument known as a searcher was introduced into the bore. It had steel points attached to springs; if there were any cavities, the points would get caught in them and the gun would be rejected. Exterior cavities exceeding a quarter inch in depth were also grounds for rejection. In another test, conducted by hydrostatic pressure, water was forced into the bore to reveal flaws such as cracks in the casting that the searcher had not detected earlier.

The gun was then fired to see if it was strong enough to sustain service charges. At the end of the 18th century, each cannon was subjected to two successive proof firings: the first with powder equal to two-thirds the weight of ball, the second with powder equal to half the weight of ball. The gun was double-shotted, with wads over and under the projectile. Only when a gun had passed all these tests would it be accepted.

It will never be known with certainty who cast the first cannon in North America, but the distinction may rest with Henry Leonard of Lynn, Massachusetts, in 1647. By 1702 a furnace in Plymouth County, Massachusetts, was producing cannon balls, and in 1710 a works established near Abington and Hanover, Massachusetts, cast cannon during the French and Indian War (1754–1763). In 1738, Hugh Orr, a native of Scotland, arrived in Bridgewater, Massachusetts, and soon set himself up in iron manufacturing there. He produced a number of muskets for that colony and may have introduced boring machinery in North America. In any case, he had it in his works. Orr certainly produced a number of cannon during the American Revolutionary War. Once that conflict began, the manufacture of cannon in America rapidly expanded.

Canoe

A lightweight, shallow draft boat made of birchbark or other water-proof material stretched over a wood frame. The basic design of the canoe has remained unchanged for thousands of years. It is long and narrow, with a rounded bottom and sides. The boat is tapered at both front and back, with raised points at either end. The canoe was originally designed and used by the Native Americans, but it was rapidly adopted by the English, French, and other Europeans.

The boat's design makes it ideal for waterborne transportation along rivers and lakes. It is lightweight but holds considerable cargo. Unlike most European designs, it is propelled by individuals facing forward, so the occupant can easily see the direction of travel. The person or people responsible for moving the canoe sits or kneels facing forward, and uses a front-to-back stroke to pull a single, two-handed paddle through the water. If there is only one person, he may alternate paddling sides to maintain course or, better, perform what became known as the J stroke. Named for the path of the paddle in the water, this stroke pulls the bow back on course at the end of the rearward motion.

The canoe design is adaptable from small, one- and two-person sizes that were about 10 to 12 feet in length to versions as long as 24 feet that could carry 10 or 12 people or several thousand pounds of cargo.

Canoes were also easy to build. They were generally made by building a birch or pine frame, held together with pine or other roots, and sealed with hot pine tar. The covering was of birch, cedar, or elm bark, all of which were smooth, flexible, and durable. The lightweight design made it easy to remove canoes from the water and carry them overland (portage), making canoes ideal for the small trading and warring parties that crisscrossed the frontier. The end

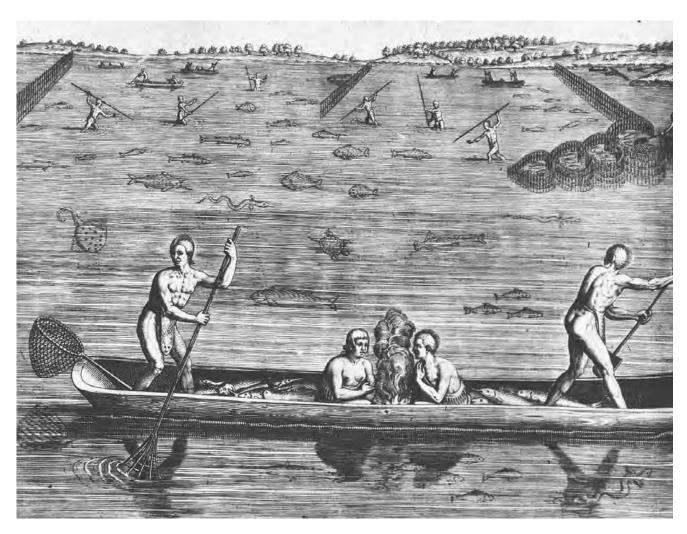

Illustration from Thomas Hariot's A Brief and True Report of the New Found Land of Virginia depicting Native Americans fishing using a dugout canoe, nets, and spears during the 1580s. (Library of Congress)

result was a craft perfectly suited for traveling long distances in shallow lakes and rivers. In areas in which there were few or no roads, canoes were often the only viable means of transportation.

Canoes remain popular even today, among outdoor enthusiasts. Although now made of materials such as aluminum or Kevlar, they are virtually the same design as their ancestors of hundreds of years ago.

Canonchet (Nanunteeno)

Born: Unknown Died: April 2, 1676

Sachem (chief) of the Narragansett tribe who became the principal military leader of the Native American alliance during King Philip's War (1675–1676). At the time, the Narragansetts were the most powerful tribe in New England, able to muster more than 2,000 warriors. Despite declaring that his people would take no active part in the conflict, in 1675 Canonchet took in refugees from tribes at war with New Englanders. Alarmed by this seemingly hostile action, New England colonists declared war and launched a winter offensive against the Narragansetts in Rhode Island in 1675.

The colonial force located a weakened entry way into Canonchet's stronghold, leading to a decisive English victory that left 600 Narragansetts dead in the Great Swamp Fight of December 19, 1675. Canonchet and most of his men escaped, however, to join King Philip's (Metacom's) forces. Canonchet proved to be the best military leader in the native alliance, ambushing and nearly annihilating a small British column commanded by Captain Michael Pierce in March 1676, then capturing and burning the towns of Rehoboth and Providence.

Canonchet realized the importance of food to the rebellion, so in April 1676 he led a handful of braves on a dangerous mission to acquire seed corn. He was intercepted by a combined force of colonists and Mohegan warriors. Taken prisoner, Canonchet was brought to trial, convicted, and beheaded in Stonington, Connecticut, on April 2, 1676. Canonchet's death was a fatal blow to the fortunes of King Philip's rebellion and the entire Narragansett tribe. Only 500 Narragansetts escaped death or enslavement out of a prewar population of about 5,000.

Canso, Battle of

Event Date: May 20, 1744

The first major colonial military action in King George's War (1744–1748). Canso was a small rendezvous point for fishermen in Nova Scotia, on the strait that separated it from the French-held Cape Breton Island. Although Canso had been controlled by the British since 1713, the population in the area remained ethnically French. Canso was one of only two British military posts on the peninsula and the one most exposed to enemy attack. Indeed, it was situated only 10 miles from Cape Breton Island and less than 70 miles from the massive French fortress at Louisbourg. Canso was once a thriving meeting place, but its importance declined in the 1730s. By 1744, Canso's British garrison had been reduced to a mere 87 men, of whom a third were regularly sick and unfit for duty, occupying a flimsy timber blockhouse and under the command of Captain Patrick Heron.

On March 18, 1744, France declared war on Great Britain, triggering what became known in America as King George's War. A fast ship must have left France within a few days to carry the news to Canada, arriving at Louisbourg in early May. The commander of Louisbourg understood that because of the unusual speed of the French ship's passage, the British garrisons in Nova Scotia almost certainly had not yet received any word from Europe. Scouts additionally brought word that the defenses at Canso were weak.

To take advantage of this temporary opportunity, French government officials and merchants helped finance a hurried expedition against Canso. Nearly 600 French soldiers and sailors, plus two privateer escort ships, set out from Louisbourg under the command of Captain François Du Pont Duvivier, a local-born officer. On May 20, 1744, the French force attacked and achieved absolute surprise, with the two privateer vessels opening the action with a bombardment. The British blockhouse was so poorly built that the first cannonball crashed cleanly through the wall and damaged four barrels of powder. Realizing that his men stood no chance against the larger, better-equipped French force, Heron rushed out of the blockhouse with a white flag of truce to negotiate the best possible terms of surrender. The surrender occurred after Heron received assurances that prisoners would soon be shipped to Boston instead of being incarcerated in a military jail.

Since Canso held no real strategic importance to the French, they burned it to the ground and took the captured British soldiers back to Louisbourg until negotiations for their parole and transportation to Boston could be concluded. On their eventual arrival in Massa-

chusetts, these former prisoners provided vital information on Louisbourg's strengths and weaknesses that later proved helpful in the 1745 siege of the fortress by New England militia forces.

Captivity Narratives

One of the most popular literature genres in the colonial period and beyond. Captivity narratives are the sensational accounts of white colonists who were kidnapped by Native Americans, lived with them for a period of time, and then were freed. Part morality tale, part religious and national propaganda, and part gory thrillers, cap-

tivity narratives were essentially propagandistic in nature and intent, whether they reinforced prejudice against Native Americans or against the French in Canada. Nevertheless, their popular appeal lay in their more titillating, voyeuristic aspects.

The earliest published account of European captivity by Native Americans was that of Álvar Núñez Cabeza de Vaca in 1542, but the popular genre was innovated by Increase Mather and Mary Rowlandson of New England in the publication The Sovereignty and Goodness of God (1682). In 1681, Mather had suggested that he and his colleagues collect stories of "special providences" concerning New England to be evaluated, sorted, and eventually anthologized; this effort became Wonders of the Invisible World (1693), but he thought Rowlandson's story too compelling to await later publication. Rowlandson had been taken captive during Metacom's raid on the central Massachusetts town of Lancaster in February 1676 and ransomed after three months. Thus her harrowing experience seemed to him a perfect allegory for a second-generation New England that—in the opinion of clerical elites—had slipped from its religious moorings. Rowlandson may also have felt a need to write a faithful rendition of her ordeal to quell rumors that she had been sexually abused by her captors. And so, with Mather most likely

serving as her editor, she produced *The Sovereignty and Goodness of God*.

Rowlandson's narrative became the standard blueprint on which all future captivity narratives were built. A devout, pure woman is ruthlessly captured by "savages," forced to endure all manner of physical and emotional torments for a length of time, and then is finally redeemed to rejoin English society. Although usually exaggerated in the narratives, there is some truth to the methods indigenous peoples typically used to subdue white hostages during their captivity, consisting mainly of forcing them to travel long distances on foot and subsisting on meager rations of whatever could be foraged on the trail. It was a physically exhausting ordeal to people unaccustomed to it, and Rowlandson frequently complained of her aches and pains as she reluctantly accommodated herself to life in Native American society. The "filthy trash" that the Native Americans ate she eventually learned to accept, and along the way she gradually won the respect and honor of her captors, meeting with Metacom himself and being temporarily adopted into his household. This she took as evidence of her racial superiority, when in fact King Philip (Metacom) was merely protecting and humoring his valuable investment. After a total of 20 "removes" that took her throughout western Massachusetts and present-day Vermont, she was redeemed by her husband Joseph in May 1676.

In this regard, captivity narratives can be studied as another form of archetypal story involving a hero's transformation through symbolic death and rebirth. The hero or heroine is somehow separated from the comfortable and familiar and compelled to undertake an extended journey that is multilayered, in that the journey is literal, psychological, and metaphorical. According to Joseph Campbell's interpretation of the "Monomyth," the hero's journey consists of three distinct stages: separation, transformation, and enlightened return. Native American captivity narratives that followed Rowlandson's extremely popular book generally kept to the same Monomythic progression that she described, however much the details varied. Although this suggests that Native American abduction practices and initiation/adoption rites shared similar dynamics, and that white captives' reactions tended to be roughly similar, the formulaic nature of the narratives that gained in popularity in 18th-century British America indicates a high degree of borrowing that belie their essentially propagandistic nature.

The second best-selling captivity narrative in the American colonies was John Williams's memoir, The Redeemed Captive, Returning to Zion, published in 1707. Williams, a minister of the Congregational Church in the western Massachusetts town of Deerfield, was captured with a number of his family members and parishioners in the Franco-native raid on the town in 1704 during Queen Anne's War. The company of white captives were marched north through winter snow to Montreal and the surrounding Kahnawake Mohawk villages over the course of nearly two months from March through April 1704. Following the by-now-conventional model for captivity narratives, Williams recounts the rigors and cruelties of the forced march through the New York wilderness, the fear of starvation and sudden death, and the horror at the witnessing of burdensome children and the wounded being killed or abandoned to die, including his wife Eunice. However, whereas Rowlandson devotes some space in her narrative to a denigration of the Christianized "Praying Indians," whom she suspected as traitors and spies to their white civilizers, Williams's narrative is most concerned with describing the attempts by the French Jesuit missionaries to convert him and his fellow captive parishioners to Catholicism. Williams's Redeemed Captive inaugurated the subgenre of anti-Catholic captivity narrative, which remained wildly popular until the American Revolution.

Indeed, this became the basic threefold purpose of captivity narratives: to reinforce prejudice against the native peoples, particularly those allied with the French; to stoke the fires of anti-Catholic bigotry; and to invigorate Francophobic British nationalism and imperialism. Captivity narratives were most popular in New England, where anti-Catholic prejudice was regularly expressed at Pope's Day celebrations every November 5 (Guy Fawkes Day in England). Production and sales of captivity narratives consequently rose with the outbreak of King William's War, Queen Anne's War, King George's War, and the French and Indian War. The latter conflict was the most catastrophic of the four, involving as it did colonial militia forces under British Army command. This war took on distinctly religious and even apocalyptic tones, as New England clergymen often described it as the first skirmishes in the foretold War of Armageddon.

Captivity of Europeans by Indians

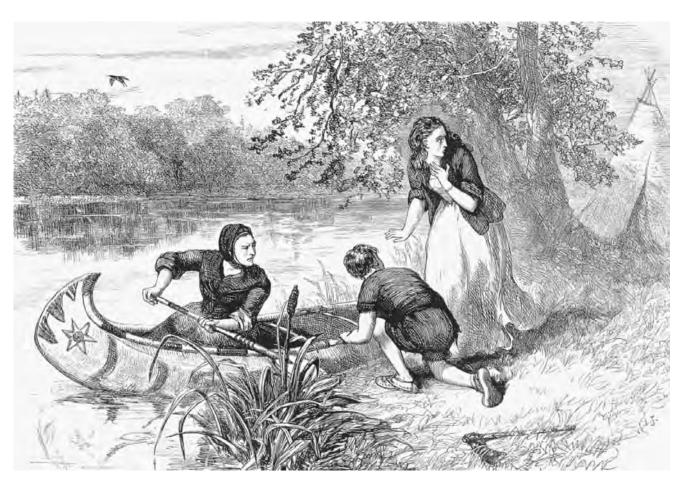

Native Americans took Europeans captive to demonstrate personal courage, replace lost family or tribe members, and for ransom. Most natives valued captives over scalps and certainly over territory as a mark of prowess in combat.

Native American war parties would go to some length to return with captives but would often execute prisoners and take their scalps as opposed to releasing them if return was impractical. Thus adult women and adolescents of both genders stood a better chance of surviving the trek back to native territory than adult men, often seen as dangerous, or young children or infants, who slowed the march.

Once returned, some captives were offered the opportunity to assimilate into the native social structure, replacing a lost member by taking on their role and status, sometimes without regard to age or gender. European captives sometimes married natives, and children were adopted into Native American families.

Other captives became ritual sacrifices, either in vengeance or as a mark of respect. Some warrior peoples believed torturing a captive gave him the opportunity to demonstrate courage. This honor was lost on most captives, who did not meet the warriors' expectations of stoicism or clever insults. Those who did show courage might earn a reprieve, or at least earn respect for their religious teachings, as did several missionaries. Other captives were eaten, either in accordance with custom or to show defiance of European values.

Native Americans who had converted to Catholicism or were in need of trade goods could ransom British prisoners to the French in Canada, where the captives were exchanged through negotiations between Europeans. The French were anxious to avoid the opprobrium that came with their native allies executing prisoners.

Hannah Dustin (right) was taken by the Abenakis during a raid on Haverhill, Massachusetts, on March 15, 1697. Dustin escaped two weeks later with a young English boy when the two killed and scalped their captors. (North Wind Picture Archives)

The capture and ransoming of captives became a central part of the economy of many tribes located between the colonial empires.

Those captives who survived removal and were offered a place in native society, especially children, often assimilated and resisted repatriation. Adult women who had converted from Protestantism to Catholicism and/or taken Native American husbands also often declined to return, fearful of the contempt their former neighbors might show them. By rejecting their birth culture, these "European transplants" posed serious spiritual and cultural problems for colonists.

Captivity of Indians by Europeans

Just as natives took Europeans captive since first contact in the 16th century, so too did Europeans capture Native Americans. Europeans valued native captives both for their labor and as potential converts to Christianity and European culture. Native Americans' resistance generally proved effective on both counts.

Colonists at war with native societies tended to kill as many men as possible to eliminate future military threats, leaving a skewed proportion of women and children as captives. Captives were valued mainly for their labor as domestic or field servants or slaves, these concepts being flexible in many cases. Over time, many colonists became disillusioned with native labor. Europeans had developed a distorted picture of the gendered division of labor in Native American societies, believing that their women would welcome the opportunity to serve white families rather than their assumed-to-be lazy or abusive husbands. Instead, the unfamiliar tasks and negative racial and cultural attitudes set up barriers to effective use of native labor, and native servants or slaves dropped in value compared to European indentured servants or imported African slaves.

Another factor contributing to the reduced value placed on Native American captives was their tendency to escape. Even in cases where the captive's original family and society were inaccessible because of removal of the captive or destruction of the society,

Woodcut depicting a Native American sold into slavery by Virginia colonists in the 1600s. (North Wind Picture Archives)

escapees could often find native communities closely matching their language and traditions, and where the custom of adoption allowed them to assume a better social position than that of a servant or slave in colonial society. In some cases natives still living in their own communities encouraged or assisted escaping captives.

Many efforts were made to convert Native American captives to Christianity and convince them to adopt colonial or European cultural values. Although feelings of cultural superiority ran both ways, European and colonial attitudes were tinged with a racism that prevented a native from fully assimilating into white society. This failure to assimilate caused much anxiety among colonial observers, but they never discovered a solution to the problem.

Other native captives had value not as laborers or converts but as hostages or subjects for exchange. Colonial forces sometimes took native notables hostage for the good behavior of their people or to convince natives suspected of criminal or warlike behavior to submit to white jurisprudence. These efforts did not often work, as colonists failed to understand the more consensual view of leadership held by most indigenous peoples, or the complex relationships between different tribes and nations.

Captivity of Indians by Indians

Native American warfare was often an affair of vengeance. For many tribes, the goal was to take scalps on a scalp-for-scalp basis. If a war party went out to avenge the death of a family member, it did not matter if the scalp of an old woman or a child was brought home in triumph. Custom required that the one originally killed had to be avenged so his spirit might rest.

Natives also sought to replace deceased tribal members by capturing people from rival tribes and adopting them. Raiding parties took captives and transported them to the raiders' home nation. Once safely delivered to the village, the prisoners' fate was determined by tribal leaders and in many cases, the relatives of slain natives. In many tribes, the latter decided whether they would adopt a particular captive to replace a lost family member or instead demand the prisoner's execution. Captured women and children were usually adopted and gradually assumed the identity, language, and customs of their captors. Occasionally men were adopted, and in some cases tribal leaders assigned captives, regardless of age or gender, to labor as slaves.

Most male captives were shown little consideration. On arrival in the capturing nation, if not selected for adoption or enslavement, they were used for murderous sport. Ritual torture was often the rule; the Iroquois were particularly notorious in this regard. The goal of the one being tortured was to remain stoic to the end.

For example, on August 30, 1763, King Haigler of the Catawbas was assassinated by a Shawnee war party that had entered the nation for that purpose. Although they were pursued by the infuriated Catawbas, the killers escaped. Five years later, on May 1, 1768, a group of Shawnees were taken captive by the Catawbas. One man was certainly identified as one of those who had murdered King Haigler. Realizing his fate, he refused to walk and was tomahawked on the spot. The other six Shawnees were not so fortunate. On May 24, 1768, they were delivered to the Catawba towns and executed Catawba style. First they were beaten unconscious with switches, then revived with cold water. This process was followed repeatedly. During this time of torture, a Catawba woman known as Betty took a liking to one of the victims. She requested that his life be spared, but her plea was denied. Rather than see him continue to suffer, Betty took a tomahawk and killed the captive herself. When the Catawbas grew tired of this sport, the remaining five were given to young boys who used them as target practice with their bows and arrows. The men finally died in this gruesome fashion.

Native Americans also occasionally practiced vengeance on the dead. At one time, the Catawbas dug up the bodies of Senecas and scalped the corpses.

Carleton, Sir Guy, First Baron Dorchester

Born: September 23, 1724 Died: November 10, 1808

British Army officer in the French and Indian War (1754–1763) and the American Revolutionary War (1775–1783); lieutenant governor of Quebec (1766–1768); governor of Quebec (1768–1778); and governor of Quebec, Nova Scotia, and New Brunswick (1786–1796). Born on September 23, 1724, at Strabane, Ireland, Guy Carleton

British major general Sir Guy Carleton, who fought in the French and Indian War (1754–1763) and was later governor of Quebec. (Library of Congress)

began his military career in the British Army in 1742. As a junior officer, Carleton cultivated a friendship with James Wolfe and served as aide to George Augustus, Duke of Cumberland, during the War of the Austrian Succession (1740–1748).

Carleton, with the local rank of colonel, was Wolfe's quarter-master general at Quebec in 1759 and was wounded leading British grenadiers in the battle on the Plains of Abraham. He participated in the attack on France's Belle Isle in 1761 and against Havana in 1762. Carleton became colonel of the 47th Regiment of Foot in April 1772 and was promoted to major general in May.

As lieutenant governor (1766–1768) and then governor of Quebec (1768–1778), Carleton was sympathetic to the French inhabitants of Canada. During a leave of absence in England (August 1770–September 1774) Carleton lobbied for the Quebec Act, which defined Quebec's boundaries, protected the practice of Catholicism, and allowed the use of French civil law. Although popular among Canada's French inhabitants, the passage of this act on June 22, 1774, added to the 13 American colonies' growing list of grievances against the British crown.

Although pushed back to Quebec City's fortifications during the American invasion of 1775, Carleton refused to surrender and thwarted American efforts to storm the town on December 31, 1775. With the coming of spring and reinforcements, Carleton reconquered Canada and defeated the Americans at Valcour Island in October 1776 before ending the campaign.

In recognition of his success, Carleton was made a Knight of the Bath in July 1776 and promoted to lieutenant general in August 1777. Carleton resigned as governor and returned to England in 1778 after disagreements with his superior in Britain, Lord George Germain, secretary of state for the colonies.

Carleton received overall command of British forces in North America in 1782. As commander in chief, Carleton oversaw the withdrawal of British forces from the United States and the evacuation of American loyalists. Carleton was made First Baron Dorchester in August 1786 and returned to Canada as governor of Quebec, Nova Scotia, and New Brunswick during 1786–1796. He was promoted to full general in October 1793. Carleton died at Stubbings, his estate near Maidenhead, England, on November 10, 1808.

Cartagena, Expedition against

Start Date: March 22, 1741 End Date: May 9, 1741

Failed British naval invasion of Cartagena, a Spanish port city in modern-day Colombia, during March 22–May 9, 1741. During the Anglo-Spanish War (1739–1744), Britain, with the assistance of thousands of soldiers from its North American colonies, staged a disastrous amphibious assault against Cartagena.

During the late 1730s, Spanish sailors had seized a number of British vessels traveling in the Caribbean, helping to precipitate war between the two nations. Cartagena offered obvious strategic and economic attractions in the war if Britain could capture it. It had a fortified harbor where Spanish galleons were moored and prepared to transport Peruvian bullion from the isthmus of Panama to Spain. By capturing the city, Britain thus stood to weaken substantially Spanish shipping in the Caribbean and possibly lay claim to some of its lucrative trade with Peru.

To execute the assault, Prime Minister Sir Robert Walpole turned to two men who were to share responsibility equally. Vice Admiral Edward Vernon was to command the British naval forces and Major General Charles Cathcart the ground forces. Cathcart fell ill en route to the West Indies and subsequently died; he was replaced by Brigadier General Thomas Wentworth. Serving under the leadership of these individuals were nearly 14,000 men, including 3,000 who were levied from the North American mainland. To defend Cartagena, Spanish viceroy Sebastian d'Eslava commanded at least 4,000 soldiers, militiamen, and seamen.

The expedition began dismally. Cathcart was just one of nearly 1,800 men who became sick or perished just crossing the Atlantic. Wentworth, whose confidence was already weakened, had his nerves further shaken when he arrived in Port Royal, Jamaica, and saw firsthand the inexperience of his American soldiers. Tension between the army and navy percolated all the way up to Wentworth and Vernon. Vernon had a low estimation of Spanish defenses and was reluctant to compensate for the decrease in available land forces by sharing any of his manpower with Wentworth. Though the two men were to share in the command of the expedition equally, the less experienced Wentworth knew he was dependent on the navy for transport, artillery support, and provisions. He and Vernon frequently squabbled over how to allocate manpower, with Vernon usually prevailing.

Cartagena sits on the northernmost of three islands that form a natural lagoon. At the time of the expedition it was joined to the mainland by a wooden bridge. To approach from the mainland, British ships opted to transport soldiers and matériel into the lagoon through a narrow passageway between the two large islands to the south of Cartagena—Tierra Bomba and Boca Chica. The heart of the Spanish defense of this entry was the fort of San Luis on Tierra Bomba, which could be taken only with a land-based assault.

On March 9, 1741, British soldiers began landing on the shores of Tierra Bomba to prepare for an attack on San Luis. They established a fortified camp, a road to San Luis with protective breastwork, and a breaching battery. The attack began on March 22 with bomb ships, mortar battery, and breaching battery opening fire. Three days later the Spanish retreated as ground troops penetrated the fort's walls. The next morning British ships began entering the harbor.

The troops and artillery from the assault then reembarked in preparation for the next phase of the expedition. Because Cartagena was unapproachable from the sea, they had to cut it off from the interior. A preliminary force of 1,400 soldiers landed on April 5 and advanced to within half a mile of St. Lazar, a fort sitting on the high ground overlooking the approach to Cartagena. Knowing that the fort would have to be taken before proceeding, Wentworth's forces dug in and waited for reinforcements. Without devoting the time and resources necessary to build a breeching battery, the army attacked on April 9 with the hope of scaling the fort's walls. The forces divided into two columns, one a diversionary column that would approach from the north, the other the main column that would attack from the south. In the darkness the main force became disoriented and ended up approaching the fort's eastern wall. This approach was steeper, narrower, and more dangerous than the one they had originally planned. Confused and under heavy fire, both columns were forced to retreat, but not before nearly three hours of fighting had resulted in approximately 600 British casualties.

As the commanders tried to assess the situation, it became apparent that the army no longer had sufficient forces to proceed, especially as cooperation between the army and navy deteriorated and Vernon became even less willing to share the labor of his sailors. In their respective dispatches to London, both Wentworth and Vernon tried to put the blame on one another. In the subsequent battle of contemporary public opinion, Vernon won, but recent historians have questioned the extent to which Wentworth should be held responsible. Be that as it may, the British had completely abandoned Cartagena by May 9 and returned to Jamaica. Disease continued to devastate Wentworth's troops to the point that he had only about 3,000 soldiers left. The expedition against the Spanish in the West Indies continued to fizzle. After returning to Jamaica the troops prepared for an assault on Santiago de Cuba but became bogged down near Guantánamo Bay, where the force fought only disease. By the time the orders to return home finally arrived, more than 10,000 men had perished, only 1,000 of them in action. American colonists perceived the deaths as evidence of the British Empire's callousness, which helped fuel the development of a separate colonial identity.

Casco, Treaty of

Event Date: April 12, 1678

Treaty signed between the magistrates of Massachusetts and the native Penobscots of Maine at Fort Loyal on Casco Bay, ending three years of armed hostilities between the two groups. In 1675, New England was wracked by Native American warfare. What was initially a conflict between King Philip (Metacom) and the Plymouth Colony became a regional confrontation involving all New England. Although King Philip's War concluded in late 1676, the broader hostilities and tensions continued. And the skirmishes led to numerous deaths on both sides.

As the violence escalated, the Penobscots became the first tribe to sue for peace. Peace articles were drawn up in Boston on November 6, 1676, and a local chieftain, Madockawando, officially ratified them. Despite the initial treaty, New England colonists soon renewed the conflict.

Following two more years of fighting in which the Penobscots destroyed all English settlements in northern Maine, both sides agreed to the Treaty of Casco Bay on April 12, 1678. Under its terms, the Penobscots allowed the English to regain their farms in return for paying rent to the natives. Thus the Treaty of Casco safeguarded land rights with the Penobscots. The peace was kept until the outbreak of King William's War in 1688.

Casco Bay (Maine)

Prominent geographic feature of Maine's southern coast. Casco Bay served important military and economic purposes during the colonial period as part of Massachusetts. The bay is 18 miles wide at its widest point, stretching from Cape Small on the east to Cape Elizabeth on the west, and contains more than 136 islands, many of which boast rocky shores, for which the Maine coast is renowned.

Casco Bay's proximity to French Acadia made it the site of frequent skirmishes. In 1676, the English constructed Fort Loyal at Falmouth on Casco Bay (present-day Portland, Maine). In 1678, the treaty formally ending King Philip's War (1675–1676) was negotiated there. In 1690, during King William's War (1689–1697), Fort Loyal was significantly rebuilt and fortified. That same year, the Abenakis overran the fort and killed most of its inhabitants. Afterward they leveled Fort Loyal and the surrounding settlement.

Casco Bay's strategic location also made it a convenient place to negotiate treaties. A subsequent 1702 treaty there brought a short-lived peace to fighting between Massachusetts settlers and the Abenakis. In 1727, a peace accord ending Dummer's War (1722–1727) was reached at Fort Loyal. The British built a new fort on the ruins of the old post in 1742 and named it Falmouth Fort.

Castillo de San Marcos (Florida)

The largest stone block fort in the continental United States, erected at St. Augustine, Florida. The Castillo de San Marcos was constructed between 1672 and 1695 and protected the Spanish settlement at St. Augustine for centuries. Long after the Spaniards left Florida, the Castillo continued to protect British, American, and even Confederate forces. It is the oldest masonry fort in the continental United States.

Construction on the fort began in 1672, four years after English pirate Robert Searles attacked St. Augustine. Searles's attack marked the second time the Spanish outpost had been destroyed by English privateers. Located on the Florida Peninsula, St. Augustine became an important link in the protection of the great Spanish commercial route that joined its rich Latin American colonies with Spain itself. The route followed by the Spanish treasure ships sailing in the Bahama Channel on their way to Spain passed close by the tip of Florida. It was thus essential that Spain establish a strong presence at St. Augustine to prevent Florida from falling under the control of its enemies, who might then establish bases there and mount attacks against the treasure ships. England's 1670 colonization of nearby Carolina brought the opposing sides closer. The proximity of the two enemies further magnified Florida's need to construct strong and modern defenses.

In 1672, Spanish officials provided funding to construct the fort. Florida's governor retained the services of Ignazio Daza, a military engineer responsible for the design and construction of fortifications throughout the Spanish Empire, including the forts at Havana and San Juan, Puerto Rico. Construction began on October 2, 1672, at the site of St. Augustine's ninth and final wooden fort. Located on the bank of the Matanzas River and overlooking Anastasia Island and the entrance of the harbor, the site had been used as a military outpost for over a century when construction began.

The fort's design centered on a square center, approximately 60 feet tall with four-sided bastions jutting out of each corner. The top of each bastion was painted red and white, Spain's traditional colors. Because of the shape of the bastions, the fort appeared triangular. A water-filled moat surrounded the fort and beyond that stood a counterguard, or secondary wall, that created a partial sea wall. A stone-like substance composed of compressed sea shells and sand called *coquina*, or "tabby," provided the material to build the fort. Workers quarried sufficient *coquina* locally to complete the project. In the 18th century, engineers added an additional wall. Known as the Cubo line, this extension began at the fort's edge and ended west of the city at the San Sebastian River.

Budget shortfalls and other difficulties prevented steady progress on the construction of the Castillo. Skilled laborers proved difficult to lure to Florida, and other workers, such as African slaves and local natives, could not work with the efficiency of a skilled crew. In addition, poor funding contributed to constant delays. Nonetheless, by 1695 much of the fort was complete and the outpost housed approximately 350 soldiers. When completed, the fort made St. Augustine the heaviest guarded city in what is now the United States.

In 1702, Carolina governor James Moore provided the first test for the fort when his troops sacked and burned St. Augustine. During the invasion, Florida residents found protection inside the walls of the Castillo. When the attack ended, St. Augustine remained in Spanish hands only because the English could not breach the walls of the fort. In 1740, the English again attacked St. Augustine but again failed to capture the fort. As before, the residents of St. Augustine fled to the Castillo, and as long as its walls could withstand the English assaults, Florida would remain in Spanish hands.

In 1763, Britain assumed control of Florida as a result of the French and Indian War. Initially, the British did not make much use of the fort until they faced the possibility of a colonial revolution. In 1775, the British renovated the fort in preparation for the coming American Revolutionary War. Although the Castillo served as a prison for captured patriots, it did not protect the city during the war with the colonies. In 1783, Spain regained possession of Florida.

During the Second Spanish Period, the Spaniards made additional repairs to the Castillo, but the fort proved an unnecessary fortification for the small outpost. On July 10, 1821, the United States assumed control of Florida and the Castillo de San Marcos. Although the U.S. Army manned and maintained the fort, its value as a defensive outpost seemed doubtful. Indeed, when the United States took command of the fort, modern artillery could have breached the 130-year-old walls. In 1825, the Americans changed the name of Castillo de San Marcos to Fort Marion in honor of General Francis Marion of the American Revolutionary War. When Florida seceded from the Union in 1861, Confederate leaders believed that Fort Marion could be a defensive asset and a potential point from which to break the Union blockade of the Atlantic coast. Florida's ports, however, quickly fell under Union control, and in the spring of 1862 Union forces took control of the fort.

During the 1870s–1880s, the U.S. Army used the fort to imprison Native Americans involved in various rebellions in the Southwest. Among the most famous prisoners were members of Geronimo's band of Apache warriors. Later, the Bureau of Indian Affairs used the fort as a processing point for Native American children who were to be sent to the Federal Indian School in Carlisle, Pennsylvania. By the late 19th century, Fort Marion stood as little more than a relic of Florida's Spanish heritage. In 1942, Congress restored its original name. Today, Castillo de San Marcos is designated a national historical landmark and is operated by the National Park Service.

Castle William (Massachusetts)

English fort built during 1700–1705 on Castle Island in Boston Harbor, which occupied the oldest fortified spot in British North America. Castle William was the fifth fortification built on Castle Island, roughly 18 acres of land lying just south and east of Boston. In conjunction with Governors Island to the north, Castle Island flanks the most accessible channel through Boston Harbor. In 1634, Gov. Thomas Dudley ordered the first fort to be erected on the island, and over the years, subsequent forts followed in the same location.

North view of Castle William in Boston Harbor, Massachusetts. (Library of Congress)

By the late 17th century, the fourth fort on Castle Island had fallen into serious disrepair. Between 1700 and 1705, the chief British military engineer, Colonel Wilhelm Romer, directed a massive expansion of the old fort, tearing down most of the existing structures and erecting new ones. He added two defensive lines, one running close to the waterline and a secondary line farther ashore. When construction was finished, Bostonians boasted that the island was the best fortified position in North America. In late October 1705, with the complex essentially complete, it was dubbed Castle William.

Britain was then in the midst of waging Queen Anne's War (1702–1713), and the castle became an important symbol of colonial defense against French aggression. The castle housed 80 soldiers with their officers and a surgeon, all of whom were militiamen. Without fail, the Massachusetts General Court annually voted funds to provide for the garrison's upkeep. After the war ended in 1713, however, the castle began to show signs of neglect.

In 1741, Gov. William Shirley focused renewed attention on Castle William. Convinced that another major war was imminent, Shirley cajoled the General Court into ordering substantial repairs, including the construction of barracks that could house 1,000 men. Nevertheless, the French and Indian War (1754–1763) ended without Castle William ever being called to actively defend the city.

By this time, however, colonial officials had discovered other uses for the castle. In November 1747, Bostonians rioted over the impressment practices of the British Navy. In response, many of the Crown's officers fled to the castle for protection. In the years leading up to the outbreak of the American Revolutionary War, the castle would be thus used on many occasions.

Although government figures often sought temporary refuge at the castle, their stay was seldom more than a day or two. In June 1768, however, the castle housed a larger contingent of crown officials for a longer period after Bostonians rioted over the seizure of John Hancock's sloop *Liberty* for customs violations. Four of the five customs commissioners, along with their families and entourages, fled to the castle and remained there throughout the summer, until British regulars were garrisoned in Boston at the end of September.

After the 1770 Boston Massacre, the castle once again came to the forefront of public attention. During the year and a half that regulars had been in Boston, they had mostly been housed in the town itself, much to the chagrin of the local populace. After the Boston Massacre, both regiments were moved to Castle William, a transfer that local figures demanded and crown officials tolerated to ease tensions. The soldiers remained billeted at the castle until the British evacuation from Boston in March 1776, when Castle William was destroyed. The Americans later rebuilt the structure as Fort Independence.

Catawbas

Native American tribe located primarily in the western Carolinas, near the border of present-day North and South Carolina, about 20 miles south of Charlotte, North Carolina. The Catawba federal reservation is near the center of what once was a very large territory, extending from south-central Virginia through North Carolina and including much of South Carolina. Today the Catawba Nation consists of some 2,000 people on a tract of land only slightly larger than 15 square miles. At their peak, the Catawbas controlled some 55,000 square miles.

From before the arrival of the Spanish, the Catawbas were held in great awe by neighboring chiefdoms. They were particularly known as warriors of great skill. This respect continued through the colonial period. It is significant that they knew better than to fight Hernando de Soto in the 16th century, for they understood Europeans' superior military power. Instead, they dealt with the potential threat diplomatically, a concept that worked rather well. The Catawba political approach was always marked by practicality. The Catawbas could not, however, escape the ravages of disease brought by European contact. Their population base dwindled from many thousands before the arrival of the Spanish to several hundred at the end of the colonial period. Indeed, the Catawbas were decimated by smallpox epidemics in 1718, 1738, and 1759.

The Catawbas first appear on the colonial battlefield beside the English settlers during the Tuscarora War (1711–1713). The Catawbas were crucial in the defeat of the Tuscarora tribe of North Carolina. Through this war, the Catawbas managed to make long-lasting enemies of the Iroquois as the Tuscaroras fled north. Those Tuscaroras not lucky enough to escape North Carolina were sold into slavery. The problem for the Catawbas was made more acute when the Tuscaroras joined the Iroquois Confederation as the sixth member nation in 1722. During the Yamasee War (1715–1717), the Catawbas changed sides and fought briefly with their fellow natives against the English. The Catawbas quickly saw the folly of this alliance, however, and made peace with the English. This marked the last time the Catawbas would fight against English settlers. Indeed, they became loyal allies of the Carolinas, enjoyed cordial relations with colonial governments, and engaged in a robust trade with the Europeans.

Although their population continued to decline through disease, the Catawbas never wavered in their loyalty. In spite of their small and dwindling numbers, the Catawbas continued to serve the

Carolinas. They also did much to disguise their growing demographic weakness. This was largely accomplished by sending incorrect population figures to colonial authorities. The Catawbas also made some temporary population gains by incorporating smaller Catawban-related tribes. The Carolinas in turn used the Catawbas as a buffer between the settlements and the Cherokee Nation to the west. During the French and Indian War (1754–1763), the Catawbas sent warriors to fight alongside the British.

The Catawbas suffered from Iroquois war parties throughout the period and lost more population to an escalating war of vengeance. These skirmishes consisted of a constant parade of Iroquois war parties seeking Catawban scalps and captives from the early 18th century until well after the Treaty of Albany (1759). The situation had become so bad in the mid-1750s that New York and South Carolina negotiated a peace between the Catawbas and the Iroquois Confederation in 1759. Wars of vengeance with other tribes did not cease, however. In 1763, a Shawnee war party assassinated the famed Catawba chief, King Haigler. When South Carolina joined the independence effort against Great Britain, there was no debate among the Catawbas. They gave their all to the colonists' effort. As the years progressed, the Catawbas gradually adapted to European warfare tactics and weaponry. During the Tuscarora and Yamasee wars, the Catawbas went into battle with the bow and arrow and war club. By the French and Indian War, the Catawba were using firearms almost exclusively, though they sometimes struggled to maintain powder and flints.

Caughnawaga (Kahnawaké since 1980)

Canadian village near Montreal that became home to a substantial Christian Iroquois community. In 1667, Jesuit missionaries invited visiting Oneidas to settle in the new village of La Prairie de la Madelaine, south of Montreal Island. The Oneidas took up the offer, and over the next decade hundreds more natives came. By 1682, an estimated 600 natives lived in the village. To accommodate the newcomers, in 1676 the village was relocated closer to the Lachine Rapids and changed its name to Sault St. Louis. Its Native American residents, who were mostly Mohawks, began referring to the settlement as Kahnawaké, after the easternmost village in the

Mohawk homeland, and the name stuck, though Europeans unfamiliar with the Mohawk language rendered it "Caughnawaga."

Migrants to Kahnawaké tended to be Catholic converts who had encountered hostility to their new faith in Iroquoia. At Kahnawaké they could practice their religion (Catholicism heavily influenced by Iroquois spiritual traditions) as well as exploit the agricultural and commercial resources offered by the St. Lawrence River Valley. The village's religious affinities and its location dictated a strong alliance with the French. Indeed, warriors from Kahnawaké were prominent participants in Canada's wars in the 1680s and after, even those against the Iroquois Confederacy. Though feared as dangerous opponents until the fall of New France, the people of Kahnawaké remained neutral thereafter, declining to choose a side during the American Revolutionary War.

Cavalry and Cavalry Tactics

The cavalry, although used in North American colonial warfare, was not as prominent as it was in the open spaces and settled farmland areas of Europe. Although widely used in the southwestern United States, cavalry saw only limited service in the woodlands of eastern North America.

In North America, as in Europe, cavalry was differentiated from dragoons and mounted infantry by both tactics and weapons. Cavalry always used the horse directly, but dragoons and mounted infantry were trained to dismount and fight on foot.

The saber, and sometimes a sword or a lance, was the essential weapon of cavalry and was coupled with one or more pistols. In contrast, mounted infantry dispensed with the bladed weapons and added a long arm, such as a harquebus or musket. The firearms of the early exploration were cumbersome single-shot devices, but as military technology evolved through the 16th, 17th, and 18th centuries, so too did the weapons and accoutrements of the horse soldier. The cavalries of North America adapted to wartime necessities, with geography, climate, ethnicity, class, and technology influencing the use of horses from exploration to the American Revolution.

The Spanish reintroduced equines to the Americas in 1494, when Columbus's second voyage landed cavalry mounts on Hispaniola. The outer islands, including Jamaica and Cuba, became breeding stations for livestock, supplying mainland explorers with

military horses. Cavalry was tactically essential to the Spanish conquest of the New World, and the breeding and importation of military horses became a priority of the first expeditions.

Early conquistadores adapted their cavalry tactics to the new enemy. In 16th-century Europe, heavy cavalry, suited in a variety of armor, was responding to newly introduced firearms and artillery. Infantry began incorporating formations such as pike squares, radically affecting the position of cavalry on the battlefield. Heavy cavalry had proven ineffective against these tactics, and lighter cavalry was increasingly used to disrupt opposing forces between gun volleys rather than as shock troops charging enemy infantry.

Evolving tactics of the time placed cavalry at the flank in support of infantry, against other mounted forces, or as scouts and couriers. In the Americas, however, Spanish cavalry was extremely effective charging small numbers of horses directly into native foot soldiers.

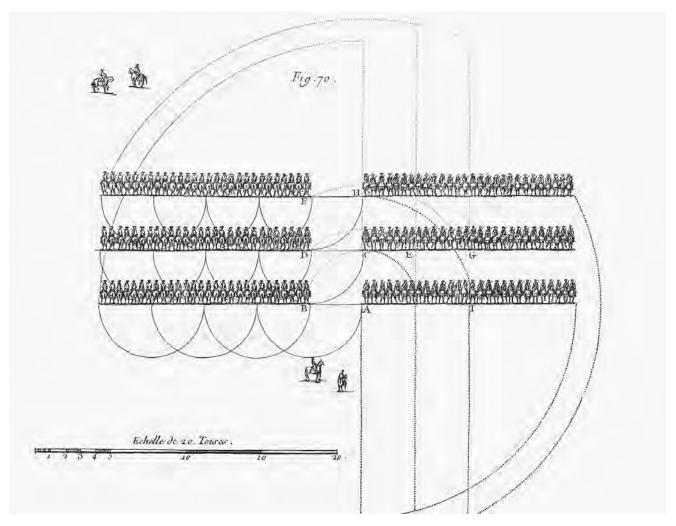

During his 1519 invasion of Mexico, Hernán Cortés successfully capitalized on the natives' fear of equines. His small force of only 16 cavalrymen was able to create terror and confusion, routing superior numbers of Aztecs and Tlascalans. In this period, the horse itself was a powerful weapon, as native populations often perceived it as a god or dangerous carnivore.

Hernando de Soto's 1539 exploration of Florida used hundreds of mounted soldiers. Later groups of Spanish cavalry continued to be successful as shock troops, but were also used as couriers and scouts. The writings of Bernal Diaz del Castillo, Garcilosa de la Vega, Francisco López de Gómara, and José de Acosta all emphasize the success of cavalry in intimidating and conquering native populations.

Inevitably, native peoples adapted to the horse, creating new mounted armies. In the 17th century, escaped, abandoned, and captured horses ranged throughout the North American continent, in both feral and domestic herds. By 1650, the Apaches of the Southwest were using horses for hunting and war, and they regularly raided Spanish settlements for livestock. Plains tribes were fully invested in horse culture by 1705, and mounted warfare was typical. Native American cavalry tactics varied widely by time, place, and people. Comanches were noted for mounted archery and lancing, as were the Teton Sioux. Other plains and mountain tribes favored the horse for adding speed and agility, but remained essentially foot soldiers.

Native American cavalry rarely fought pitched battles in the European style or rode in formation; instead, each rider worked more as an individual, harassing the enemy and fleeing until the goal of the battle had been achieved.

The northeastern colonies and Canada (New France) did not promote cavalry as Spain had in the south and west. These colonies relied less on mounted armies for exploration and conquest, and did not emphasize the importation and breeding of military horses. Northern geography and climate played a role, because the dense woodlands, tidewaters, and swamps, combined with harsh winters, made cavalry more difficult to maintain and deploy. Additionally, Spain had developed an Old World horse culture that was fairly egalitarian, with all classes of society using equine labor.

Early 18th-century engraving depicting the formation of marching columns for a 168-man squadron comprising four companies of 42 cavalrymen each. (The Granger Collection)

In contrast, the English and French had a deep class bias, viewing equestrian sports as the provenance of the aristocracy. English colonists of the lower classes preferred the use of oxen and were more typically engaged in infantry militias than cavalry units; these preferences were apparent in the 1649 census of Virginia, which showed only 200 horses in a colony of 15,000 people.

Regular cavalry units sent from Europe were rare in the north and east during the 17th and 18th centuries. It was expensive and difficult to ship horses and maintain regular cavalry in the Americas, particularly while the nations of Europe were engaged in various wars on the Continent. Individual colonies were responsible for their own defense and relied on a militia system. Volunteer cavalry units eventually joined the infantry; for example, in 1667, Rhode Island mustered its first cavalry unit, the Island Troop of Horse near Newport, as part of the militia system. These cavalry militias increased and expanded throughout the 18th century, but they remained subordinate to infantry in numbers and practicality. Most mounted forces in the northeast were essentially dragoons,

fighting on foot as well as from horseback, as the guerilla style warfare in these areas did not lend itself to mass cavalry charges or pitched saber battles.

In the 18th century, European American cavalries increasingly fought each other. The first cavalry unit of New France was formed by Major General Louis-Joseph, Marquis de Montcalm, to defend Quebec against the British. It fought in the pivotal Battle of the Plains of Abraham in 1759. The British and the Spanish cavalry clashed in Cuba in 1762, participating in the siege of Havana.

In the second half of the 18th century, the Spanish colonies continued to actively breed and use military horses, often engaging Native American cavalries on horseback. In contrast, the British and French colonies continued to rely primarily on infantry. Strapped by the wars in Europe, England was without regular cavalry in the colonies at the outbreak of hostilities in 1775.

During the American Revolutionary War, the 17th Light Dragoons arrived from England in May 1775, and Continental Army commander General George Washington soon realized he would

need horse troops to effectively fight the war. New York and Connecticut sent four units of light cavalry to Washington, which proved useful on the flanks and to the rear of the infantry but had relatively little impact during the early battles. Washington employed his small cavalry to gather intelligence and scout, but needed more horses to form a tactical force. On December 12, 1776, the Continental Congress created the Regiment of Light Dragoons and a short time later authorized an additional 3,000 horses. At the same time, First Troop, Philadelphia City Cavalry joined the Continental Army. By the end of 1776, the U.S. Cavalry was born.

Cayugas

Tribe of Native Americans who traditionally occupied the Northeast Culture Area and a part of the Iroquoian language group. In pre-European society, Cayuga hunting territory was largely located in modern-day New York state and Ontario, particularly in the Finger Lakes District (Cayuga Lake still bears their name). Traditionally, the Senecas lay to the west of their homeland and the Onondagas to the east. In 1660, after disease had decimated the Cayugas, their population was reported to have been just 1,500. They were one of the five original members of the Iroquois Confederation and as such played a fundamental part in colonial warfare in North America.

There is some speculation about the definitive definition of the word "Cayuga," but it has been reported to mean "where the boats were taken out," "where the locusts were taken out," or "mucky land," all of which refer to the lands the tribe traditionally occupied. Their name in the Iroquois Confederacy council, however, alludes to them as "those of the great pipe."

The Cayugas operated on a system of matrilineal descent, with the matron of each clan appointing a spokesman (or chief) for the clan. As such, Cayuga women were politically powerful and influential. Generally, Cayuga males spent a lot of time away from their tribe hunting, fishing, trading, and fighting. The women remained in the village and provided sustenance through crops for the remaining tribe members. Corn was their main staple, but squash, pumpkin, and beans were also grown. Cayuga villages usually consisted of 20 to 50 longhouses that sustained 15 to 30 people each.

Although the Cayugas were small in number and territory, they had great clout in the Iroquois Confederacy. They sent 10 chiefs (or sachems) to the council of 50 chiefs and were a fierce fighting force within the Iroquois Confederacy. During 1667–1684, they were constantly engaging in the Beaver Wars with neighboring tribes as well as European conflicts. The Cayugas were officially neutral during the French and Indian War (1754–1763) but generally fought with the French. During the American Revolutionary War they sided with the British and lost all their traditional homelands in the aftermath. After the American Revolution, many moved onto reserve land in Ontario set aside for the Six Nations of the Iroquois Confederacy.

Today the language of the Cayugas is still spoken, and many Cayugas continue to live in Ontario on reserve land. As a tribe they have never given up their land claims in New York, and they have a strong case because their treaties were negotiated by state officials and not federal representatives after the American Revolution. Their land claims are still being negotiated by courts in the United States today.

Chabert de Joncaire, Louis-Thomas

Born: ca. 1670 Died: June 29, 1739

French soldier, interpreter, and diplomat. Born about 1670 in Saint-Rémi de Provence, France, Louis-Thomas Chabert de Joncaire went to New France in the late 1680s as a cavalry sergeant in the colonial regular troops. Sent on a mission to improve relations with the Iroquois soon after his arrival, Joncaire was captured by the Senecas. They spared his life and adopted him into their tribe. Given the name "Sononchiez," he learned the Seneca language and

acquired a fundamental understanding of their outlook. Joncaire was thus in a position to render important services to New France whenever negotiations were conducted with the Iroquois.

Joncaire played a significant role in the discussions that led to the peace treaty of 1701, ending the second Iroquois war, when he managed to prevail on all the Iroquois tribes except the Mohawks to send an official delegation to New France to negotiate a treaty with the French and their native allies. During Queen Anne's War, he was chosen by Gov. Philippe de Rigaud de Vaudreuil to help preserve Iroquois neutrality. He achieved this by using his personal influence with the Senecas, presenting them with gifts from the French government, and playing on their fears by warning of an attack by the western nations if they should break the treaty. Joncaire's knowledge of the Iroquois was also essential in their solidarity with the French, when in August 1711, Vaudreuil summoned 800 chiefs from a dozen different tribes to Montreal to renew the alliance with them. When the delegates were asked to declare themselves against the British, Joncaire stood up before the assembly and broke into a war song; he was soon joined by all the chiefs.

After the end of Queen Anne's War, France moved to consolidate its position around the Great Lakes. Its main interest was to control the Niagara and its portage, which would deny the English access to the Great Lakes region and ensure the safe movement of goods and furs to New France. When Vaudreuil learned that the English were planning to occupy the Niagara, which was on Seneca territory, he sent Joncaire to the Senecas to win their assent to a French post. In 1720, the Iroquois agreed to allow Joncaire to establish a trading house, which he named Magasin Royale (King's Storehouse), at the foot of the Niagara escarpment. It was not a strong post, however, and in 1723 he obtained the Senecas' permission to replace the original post with a wooden stockade. Termed a "House of Peace," it was more of a fortified trading post than a formal military post.

In 1731, Joncaire was selected by Gov. Charles de Beauharnois de La Boische to lead a group of Shawnees who had migrated from the Susquehanna to the Allegheny River. His mission was to prevent them from trading with the English and to induce them to move their village farther west, where French influence was greater. Joncaire was apparently working at this task when he died at Fort Niagara on June 29, 1739.

Chabert de Joncaire, Philippe Thomas

Born: 1707 Died: 1766

French military officer, trader, interpreter, and diplomat. Philippe Thomas Chabert de Joncaire was baptized on January 9, 1707, in Montreal, the eldest son of Louis-Thomas Chabert de Joncaire. At age 10, Philippe was sent by his father to live among the Senecas, who named him Nitachinon. He entered the French colonial regular troops in 1726, became a second ensign in 1727, and rose to captain by 1751.

In 1735, Joncaire succeeded his father as New France's principal emissary to the Iroquois. He reported on tribal politics to the governor, acted as mediator between the Iroquois and the French, supplied all sides with trade goods, and watched British movements in the region.

Joncaire resigned in 1748 and was succeeded by his brother Daniel. However, he was soon recalled to the frontier. In 1749, he became interpreter and adviser for Pierre-Joseph Céloron de Blainville's expedition to the Ohio Valley. He then established contact with the Delawares and Mingos, and he narrowly escaped death when he was seized at Sonioto (Portsmouth, Ohio) by Shawnees. When Blainville's forces withdrew in the autumn, Joncaire accompanied them. He returned to the area a year later and was stationed at Chiningué (Logstown, now Ambridge, Pennsylvania) to prepare for a more substantial French occupation. In 1753, Joncaire moved to a deserted trading post near the mouth of French Creek, on the site of Franklin, and stayed there until the French built Fort Machault (Venango), in the spring of 1754. Joncaire was in charge of the delicate diplomacy required to maintain the goodwill of the Delawares and Shawnees and to neutralize the opposition of the Iroquois colonists on the Ohio, who protested the construction of forts.

The final crisis in Joncaire's rivalry with the British for Iroquois allegiance began in 1755. When four separate enemy armies approached the borders of New France, Gov. Pierre de Rigaud de Vaudreuil was anxious to learn the sentiments of the Iroquois. In the autumn of that year, he met with a delegation of Senecas under the leadership of Chief Guyasuta. The Senecas requested that Joncaire return to reside among them as a symbol of the Seneca-French alliance. Joncaire used his post with the Senecas to learn of developments among the Iroquois. He called on them to supply war parties to aid the French or, failing that, to observe the neutrality they had officially embraced. In 1758, as the Indians saw emerging evidence of British power, the French cause began to weaken. Joncaire's network of informants failed to warn him of an attack on Fort Frontenac (Kingston, Ontario) in August 1758. In June 1759, a party of Mohawks ventured into Seneca country and surprised Joncaire in his trading post. He was able to flee and retreated to Fort Niagara, where he was captured in July when the fort fell. Joncaire went to France in 1760, where he was made a knight of the Order of Saint Louis. It is not known whether he ever returned to Canada, but in a letter written on November 9, 1766, Lt. Gov. Guy Carleton referred to Joncaire's recent death.

Chabert de Joncaire de Clausonne, Daniel Marie

Born: 1714 Died: July 3, 1771

French agent, trader, interpreter, and diplomat. Baptized on January 6, 1714, in Repentigny, Quebec, the son of Louis-Thomas Chabert de Joncaire, Daniel Chabert de Joncaire was sent to live among the Senecas as a young boy. In the ensuing years he also resided for some time among the Ottawas, Ojibwas, and Shawnees. His later influence among the Indians was certainly enhanced by his status as an adopted son of the Iroquois and the fact that he had a Seneca wife and children by her.

In 1740, Joncaire (who also became known as Chabert de Joncaire de Clausonne) acted as an interpreter in the peace negotiations between the French and the Chickasaws of the lower Mississippi Valley. He was promoted to ensign in the colonial regular troops in 1748 and, after his brother Philippe Thomas resigned that same year, became France's principal agent among the Iroquois. Despite Iroquois objections, Clausonne began constructing a new fort, which became known as the Little Fort Niagara or Fort du Portage, about a mile and a half above Niagara Falls. He took command of the new post and was subsequently given a monopoly on the portage traffic. In 1757, he was promoted to lieutenant.

During the 1750s, Clausonne tried to counter growing British influence among the Native Americans by making numerous visits to the various nations. The British prevailed, however, and in 1759, when the Iroquois allowed William Johnson's forces to besiege Fort Niagara (near Youngstown, New York), Clausonne was among the officers who signed the capitulation on July 25. In December 1759, an exchange of prisoners brought Clausonne to Montreal, where he served with the army under François Gaston, Duc de Lévis, who besieged James Murray at Quebec in the spring of 1760. When the siege was lifted, Clausonne retreated with the rest of the troops to

Montreal and was sent to assemble Native Americans for the defense of that city by Gov. Pierre de Rigaud de Vaudreuil.

In 1761, Clausonne left Canada for France. Soon after his arrival he was among the 23 people imprisoned in the Bastille in connection with the "Canada affair." These civil officers, military people, and traders were accused of misappropriating public and royal funds. Clausonne and the others remained in the Bastille until the end of their trial in December 1763. At his trial, Clausonne explained the considerable wealth he had accumulated by claiming to have engaged in a profitable trade in ginseng. But it was the fur trade that was the source of his wealth, in which he, as with other officers, had engaged despite explicit orders to the contrary. The court found Clausonne guilty of carelessness in examining the inventories of provisions in the forts he had commanded, yet it acquitted him.

Clausonne went to London, and in October 1764 he unsuccessfully petitioned the British monarch for land on the east bank of the Niagara River—a site near his former fort that included the present-day Buffalo River, land he asserted had been given to his father by the Iroquois. British authorities warned Governor Murray that despite his failure to get the land, Clausonne was planning to return to Canada and should be prevented from conversing with Native Americans. Murray, however, was soon succeeded by Guy Carleton. Clausonne applied to the new governor for permission to trade with the local nations. After personally assuring him of his future good conduct, Clausonne was at last allowed to go to Detroit in 1767. He died and was buried there on July 3, 1771.

Chacato Troubles

Start Date: 1674 End Date: 1676

Native American rebellion against Spanish missionaries. During 1674–1680, the Spanish established two missions, San Carlos de Chacatos and San Nicolas de Tolentino, under the auspices of

fathers Rodrigo de la Barreda and Miguel de Valverde in Jackson County, Florida. The missions were part of an effort to convert the Chacato (or Chatot) tribe to Christianity. The Chatots are believed to have been related to the Choctaws.

In 1674, a few months after the establishment of the missions, the Chisca (Yuchi) tribe, which lived nearby, began to incite a rebellion among the Chatots against the missionaries. A force of Spanish soldiers under the command of Captain Juan Fernandez de Florencia, deputy governor of the Apalachee Province, was sent to quell the uprising. Florencia was successful in quelling the disturbance, and the mission work continued peacefully.

However, when the Spanish soldiers withdrew in late 1674, the Chatots once again revolted and completely destroyed the missions of San Carlos and San Nicolas. Both missionaries fled to the mission of Santa Cruz de Sabacola, urgently seeking help. As a result of the second uprising, Florencia returned to the Chatots' tribal lands in 1676 with a large force of Spanish soldiers and mission Native Americans from the Apalachee Province. Convinced that the Chiscas were again responsible for the Chatots' latest rebellion, Florencia crossed the Choctawhatchee River and attacked the Chisca village there, killing hundreds of the tribe. After the removal of the Chiscas, the Chatots were then relocated eastward to the vicinity of Sneads, where, in 1680, a new mission known as Señor San Carlos de Chacatos was established among them.

In 1696, however, this new mission became the focus of hostilities between the Spanish and the Native Americans to the north in what are now Alabama and Georgia. Several of the Chatots were killed, and others were carried away as captives. The few survivors fled to the region of San Luis (Tallahassee), then to the French settlements near Mobile, and later onward to Texas and Oklahoma. Nevertheless, the Chatots disappeared as a people in the early 1700s.

Champlain, Samuel de

Born: July 3, 1567

Died: December 25, 1635

French explorer, writer, cartographer, colonizer, governor of New France, and founder of Quebec. Born in Brouage, southeast of Rochefort, France, on July 3, 1567, Samuel de Champlain was the son of a ship's captain. He was briefly educated by parish priests and spent several years working aboard his father's ship. He then became a billeting officer for the French Army (1594–1598) and

French geographer and explorer Samuel de Champlain. Founder of Quebec and governor of New France, he helped establish the French in Canada. (Library of Congress)

served on chartered French ships carrying cargo to and from the West Indies during 1599–1601.

His time in the West Indies fueled Champlain's curiosity about the New World, and on his return to France he was appointed a royal geographer. In 1603, he journeyed to Canada with noted explorer Francis Grave, Sieur du Pont Pontgravé, who established a trading post at Tadoussac. Champlain then traveled up the St. Lawrence River to the Lachine Rapids, before returning to Tadoussac and embarking with Pontgravé for France.

Champlain returned to Canada in 1604 in an expedition headed by Pierre Du Gua de Monts to Acadia and helped found St. Croix in 1604 and Port Royal in 1605. Having learned from the established explorers of his day, Champlain mapped New England as far south as Martha's Vineyard (Massachusetts). He returned to France in 1607.

In 1608 Champlain returned to North America with 32 colonists to found a fur trading outpost at Quebec. There he built on the work of Jacques Cartier and allied himself with the local Huron and Algonquin tribes. Champlain twice assisted the Hurons in defeating their rivals, the Iroquois, during 1609–1610, leading to 150 years of hostility between the Iroquois and the French.

114 Charles Town (South Carolina)

In 1612, Champlain was appointed commandant of New France. He regularly traveled to France (making 21 Atlantic crossings between 1603 and 1633) and promoted trade, exploration, missionary work, and military alliances with the Native Americans. Champlain carried the first Recollet and Jesuit missionaries to New France in 1615 and 1625, respectively, and he pushed for agricultural colonization to diminish dependence on the fur trade. He hoped that increased self-sufficiency would render New France better able to compete with English colonies to the south.

Champlain also conducted a series of explorations that made clear the vast extent and military importance of many of North America's most important waterways. He made the first ascent by a European of the water route between the St. Lawrence River and the Hudson River, and in 1609 he discovered the lake that bears his name. Champlain made the first European traverse of the Ottawa River to the head of Lake Huron and then to Lake Ontario in 1613, and in 1615 he finally reached Georgian Bay. Champlain kept meticulous maps and journals of each expedition, then published his findings in a series of books. These detailed accounts dramatically increased French (as well as English) interest in Canada.

English forces captured Quebec from Champlain after a year-long siege in 1629. When the city was ceded back to France in the Treaty of St. Germain-en-Laye in March 1632, Champlain returned, despite the fact that he was already 65 years old. Appointed governor of New France by King Louis XIII in 1633, Champlain inaugurated a period

of expansion, founding settlements at Beauport and at Trois Rivières in 1634. He also reestablished Jesuit missionaries among the Hurons.

Champlain died in Quebec on December 25, 1635. He is buried there in the Church of Notre-Dame de la Recouvrance and is remembered as the founder of French Canada by a large statue in the Old City.

Charles Town (South Carolina)

A major seaport and settlement on the southern coast of the Carolina Colony (as it was known until 1712). Charles Town, later Charleston, was the first settlement in Carolina. Later, it became the colonial capital and served as one of the principal ports for the southern colonies. It also served as South Carolina's primary port

Engraving of Charles Town (present-day Charleston), South Carolina in 1673. (Kean Collection/Getty Images)

since the 17th century, even though it is vulnerable to tropical storms and hurricanes. Because of its role as a major port, Charleston held a great deal of strategic value and was often the target of attack.

A group of favorites of King Charles II, known as the Lords Proprietors, established the colony at Albemarle Point near the Ashley River in 1670. The Proprietors named the settlement Charles Town, after their benefactor. The name changed to Charlestown around 1719 and then to Charleston in 1783. Meanwhile, in 1712, Carolina was split in two, creating North and South Carolina. Around 1672, after Charleston's location had proved undesirable, the town was relocated to a new site, situated between the Ashley River and Cooper River. This is the site of present-day Charleston. In 1680, this new town became the seat of the colonial government.

Once in its new location, the town grew rapidly, mainly because of its port activity. Charleston was a major point for exporting the produce of the southern colonies and for the importation of European-manufactured goods as well as African slaves. Although the colony grew to include many different ethnicities, Charleston remained predominantly English. This demographic lent its unique stamp to the city, which became a cultural center of the southern colonies as well as their political center.

Often, Charleston served as a staging area for expeditions to the interior of the colony. This was the case when the colony came to the aid of North Carolina in the Tuscarora War (1711–1713). Likewise, the pattern repeated itself during the Yamasee War (1715–1717), when South Carolina governor Charles Craven used the city as an area in which to organize movements against the hostile natives of the interior.

Native Americans were not the only threats to the colony's coast, however. In 1706, during Queen Anne's War (1702–1713), the town came under assault by French and Spanish forces. Nathaniel Johnson, governor at the time, successfully repelled the attack. Charleston was also ripe for slave rebellions. The town was a major slave port, with nearly 40 percent of the Africans imported into North America passing through Sullivan's Island in Charleston Harbor between 1700 and 1750. With such a large transient and restive population, slave insurrection stood as a constant concern for Charlestonians.

Indeed, the fear of a slave revolt became a reality in 1739 with the Stono Rebellion, instigated in part by the governor of Spanish Florida. Part of the plot involved seizing weapons to arm slaves who would then march on Charleston. The attempt to foment insurrection within the colony grew out of the burgeoning Anglo-Spanish War, also known as the War of Jenkins' Ear (1739–1744). Above all, Charleston's proximity to Spanish-held Florida, its natural and commodious harbor and ports, and its central role as the economic and cultural powerhouse of the lower South lent the city an importance that few other colonial cities possessed.

Charles Town, Attack on

Start Date: September 7, 1706 End Date: September 1706

Combined Spanish and French attack against the English colonial port of Charles Town (present-day Charleston, South Carolina) beginning on September 7, 1706, during Queen Anne's War (1702–1713). The offensive was intended to ease English pressure on Florida, which English and Native American forces had attacked several times over the previous few years. As long as the Spanish held St. Augustine, English coastal settlements were permanently threatened with amphibious assault. But at the same time, the English coastal settlements were a threat to both the Spanish in Florida and the French in Louisiana.

In early September 1706, Captain Jacques Lefebvre led a French naval expedition from St. Augustine. He had secured Spanish ships and men in both Cuba and in St. Augustine. En route, the French vessel *La Brilliante*, carrying commander of the land forces General Arbousset and 200 of his troops, fell in with a Dutch warship and became separated from the rest of the squadron.

Lefebvre and the remainder of the squadron pressed on. The five French and Spanish ships entered Charles Town Harbor on September 7, 1706. The city had already been warned of impending attack by smoke signals from lookouts on nearby Sullivan's Island. Lefebvre demanded Charles Town's capitulation, which the Carolinians refused outright.

Several days later, Lefebvre sent ashore his land forces. The invading troops, organized into two main parties, managed to inflict some damage to outlying property. On James Island, however, militiamen and Native Americans defeated Spanish raiders, but 160 Spaniards destroyed a building and two small boats on land between the Wando River and the Atlantic Ocean. The Spanish celebrated and rested to prepare for what they expected would be victory on the following day. Carolina militiamen, however, launched a surprise attack, defeating the Spaniards and capturing 60 of them. Another 12 were slain in the fight and several of the raiders drowned. Later, Charles Town militiamen dispatched a half dozen boats, including a fire ship, against the French fleet. Lefebvre then ended the operation, recalled the remaining raiders, and sailed away.

Not long after Lefebvre's departure, *La Brillante* arrived and Arbousset arrived and put his men ashore at Seewee Bay, east

of Charles Town. Arbousset and his men then moved toward Charles Town as if planning to take it by direct assault. While one group of militia engaged and then repulsed Arbousset and his men, another group captured *La Brilliante*, ending this threat. The Carolinians had captured 320 French, Spanish, and natives and killed another 30.

Chaussegros de Léry, Gaspard-Joseph

Born: July 20, 1721 Died: December 11, 1797

French military engineer and officer in the colonial regular troops (troupes de la marine) of New France. Gaspard-Joseph Chaussegros de Léry was born in Quebec on July 20, 1721, the son of the chief engineer of Canada.

A cadet in the troupes de la marine at age 12, he fought his first campaign far from home, in what is now Mississippi. Léry was part of a detachment of 200 Canadians and 300 Native Americans sent south in 1739 to help the governor of the French colony of Louisiana, Jean-Baptiste Le Moyne de Bienville, defeat the Chickasaws, allies of the English. In the 1740s his career alternated between building or strengthening fortifications in Canada and the Great Lakes region and raids into New England. In 1746 Ensign Léry served with the Canadian and Native American force that captured and destroyed Fort Massachusetts at Williamstown, Massachusetts, and laid waste to the surrounding region.

Ten years later, by now a lieutenant, Léry was given a command of his own and led a force of 360 Native Americans, Canadians, and French regulars through trackless forests in the depths of winter to attack a British supply depot at Fort Bull (near present-day Oneida Lake, New York). Destruction of the depot and its accumulation of supplies wrecked British plans for a spring offensive in the Great Lakes region and set the stage for the capture of Fort Oswego by the army of Major General Louis-Joseph, Marquis de Montcalm, later in the year. Léry distinguished himself in the latter operation as a commander of Canadian and Native American troops. His feats in 1756 won him a promotion to captain and the Cross of Saint Louis. The succeeding decade, however, would be less kind to Léry.

Wounded at the Battle of Quebec, Léry was a British prisoner of war for a time and in 1761 he and his family were bundled off to

France. Unable to obtain employment in the French armed forces, Léry decided to return to Canada, where his family still owned extensive properties. Arriving in Quebec in 1764, he managed to ingratiate himself with the British provincial government and was rewarded by being made commissioner of roads for Quebec province. He was also given appointments to the legislative councils of Quebec and Lower Canada. Léry died in Quebec on December 11, 1797.

Cherokees

Native American nation strategically located in and around the southern Appalachian Mountains. During the colonial period, the Cherokees were one of the largest and most formidable native groups in the eastern woodlands of North America. The alliance with English colonists gave the British a military advantage over their antagonists in the Southeast, namely, the Spanish, French, and their native allies. From their homeland in the Appalachian Mountains of North Carolina, the Cherokees during the early- to mid-17th century helped force the Koasatis (also known as Coushattas) and Muscogees from their homelands in eastern Tennessee, northwest Georgia, and northeast Alabama into central and eastern Alabama. This action opened up land to the gradual settlement of Cherokees first into eastern Tennessee in the 17th century and later in the 18th century in northwest Georgia. During most of the 17th century, the Cherokees joined Chiscas, Westos, and Yuchis in slave raids on Apalachees, Creeks, Timucuas, and Yamasees among other Native American groups in Alabama, Georgia, Florida, and South Carolina. Slaves from these raids were traded to the English in Virginia and South Carolina for guns, an assortment of metal utensils, and cloth, among other items. Cherokee warfare and their raids against native peoples located to their south helped to create the consolidation of various native groups into what later became known as the Creek Confederacy.

By the beginning of the 18th century, the Cherokees lived in five groupings of towns named according to their geographic relationship with the English colony at Charles Town (present-day Charleston, South Carolina). They were the Lower, Middle, Valley, Out, and Overhill towns. The Lower Towns were located on the eastern side of the Appalachians, mostly in South Carolina with some also in Georgia and North Carolina. The Overhill settlements were located on the other side of the mountain chain in Tennessee. The

Cherokee Native Americans. The Cherokees occupied the area of the southern Appalachian Mountains and were one of the largest Native American tribes during the colonial era. (North Wind Picture Archives)

other three groups of settlements were located between the Lower Towns and Overhill Towns in the mountain valleys, with the Out Towns to the northeast of the Middle Town settlements and the Valley Towns to the southeast of the Middle settlements.

The Tuscarora War was the first time Cherokee war efforts directly affected British colonists. The Cherokees along with other native groups in Alabama, Georgia, South Carolina, and North Carolina helped the colonists defeat the Tuscaroras in the Carolinas during 1711–1713. The Cherokees sent a contingent of 200 warriors to participate in this war in which South Carolina used more than 1,000 southern warriors to permanently expel the Tuscaroras from North Carolina.

Soon after the end of the Tuscarora War, the Lower Towns of the Cherokees joined other natives in a war against the British in South Carolina known as the Yamasee War (1715–1717). The initial allies of the Lower Town Cherokees included all the Native Americans located between Cape Fear in North Carolina to the Alabama River

in central Alabama. With the encouragement of British officials, the Lower Towns, and eventually all of the Cherokees, turned against their native allies in this war and joined the Carolinians in quelling this native uprising. This Cherokee shift in allegiance initiated a war with the Creeks that lasted until 1755.

In 1730, for reasons known only to himself, Sir Alexander Cuming visited the Cherokees and eventually convinced a majority of the towns to swear allegiance to and recognize the sovereignty of King George II. In order to validate his accomplishment, Cuming took seven young warriors with him on his return to Great Britain. One of the young men to accompany him became known as Attakullakulla, and he would remain a staunch advocate for a continued allegiance to the British over the next several decades. By creating this alliance with the Cherokees, Cuming secured the western frontier of the Carolinas and Virginia against French encroachment until the outbreak of the Cherokee War in 1759.

With the outbreak of the French and Indian War in 1754, the British continually called on the Cherokees for aid in their fight against the French and their native allies. The eventual British success in the Ohio Valley can in no small part be attributed to the fighting savvy of the Cherokees. Cherokee war parties blocked numerous Shawnee and other transmountain Indian raids from reaching Virginia and the Carolinas.

Prior to the outbreak of the French and Indian War (1754–1763), the British built Fort Prince George near the Cherokee Lower Town of Keowee to facilitate trade with the Cherokees and provide military support for their staunch allies. However, the Overhill Cherokees also wanted a fort built among their towns to provide a refuge for the families of Cherokee warriors as they went out in war parties fighting for the British. Finally, the British decided to shore up their position among the Cherokees by building Fort Loudoun among the Overhill Towns in 1756.

The relationship between the Cherokees and the British soured in 1758 and 1759, just as the British gained the upper hand over the French in the French and Indian War. Eventually, after a series of unfortunate but avoidable incidents exacerbated by South Carolina governor William Henry Lyttelton's imprisonment and massacre of a Cherokee peace delegation at Fort Prince George, full-blown warfare broke out between the Cherokees and British in 1759. Under the primary leadership of Oconostota ("Great Warrior"), the Cherokees turned back a British expedition led by Colonel Archibald Montgomery and captured Fort Loudoun in 1760 before suffering the burning of villages among the Lower, Middle, and Valley towns by a second British campaign under the command of Colonel James Grant in 1761. Attakullakulla negotiated the end of hostilities with Grant in 1761. Afterward, the Cherokees again became close allies of the British until the defeat of both at the hands of American troops during the American Revolutionary War.

Cherokee War

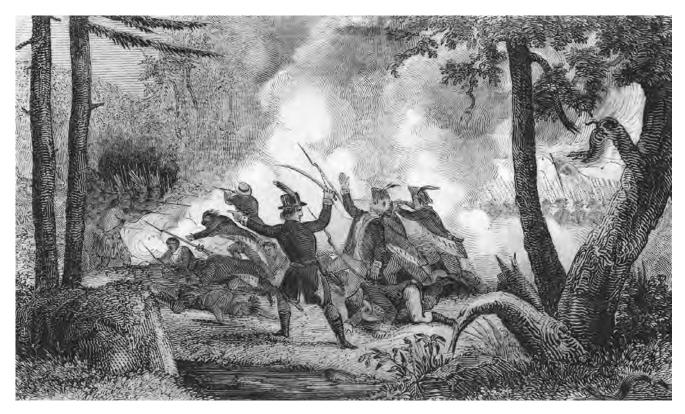

Start Date: October 5, 1759 End Date: November 19, 1761

A protracted and devastating frontier conflict that weakened the Cherokee Nation but did not break its traditional alliance with Great Britain. Throughout the 17th and 18th centuries, the Cherokees, an Iroquoian-speaking assemblage of tribes, were the largest ethnic bloc along the southern Appalachian highlands, an area encompassing parts of present-day West Virginia, Virginia, Kentucky, Tennessee, Georgia, and the Carolinas.

The tribe itself, numbering as many as 21,000 in 1735, was a regional power to be reckoned with. Early on, the Cherokees had established friendly trade relations with English colonial settlements in Virginia and the Carolinas, and fought alongside them and against their traditional Creek and Yamasee rivals in 1716. The English saw the Cherokees as a potential ally against Frenchmanipulated Creek and Shawnee tribes situated to the north and south. In 1730 several leading chiefs arrived at London for a formal appearance at the court of King George II. There a formal treaty of alliance was sealed with several individuals, the most prominent being Oconostota, who held the title "Great Warrior," and Attakullakulla, a peace chief.

The next 25-year interval proved both peaceful and prosperous. But the onset of the French and Indian War (1754–1763), plus a rising tide of white encroachment on Cherokee territory, led to increasing friction between the erstwhile allies. The British, for their part, sought to protect the Cherokees from French attacks—and influence—by constructing Fort Prince George near Keowee (South Carolina) in 1753, and Fort Loudoun near Chota (Tennessee) in 1756. Whatever military benefits these posts conferred was basically negated by the growing perception and resentment among Cherokees that their territorial rights were being infringed on.

By 1758, many elements within the tribe waxed openly hostile toward the British and a single provocation could transform simmering resentment into frontier violence. When the French and Indian War began in 1754, the Cherokees dutifully dispatched war bands to assist Brigadier General John Forbes in his campaign against Fort Duquesne. But on the return home, these same warriors were attacked and killed by Virginia militiamen who claimed that they had stolen their horses. The tribesmen were understandably enraged when their slain warriors were then scalped by the militiamen, who subsequently collected bounties on the scalps. These acts triggered a spate of retaliatory raids against English settlements across the southern frontier, resulted in the deaths of at least 20 whites, and prompted the former consorts to take up arms against each other.

Lieutenant Francis Marion leads an advance guard of South Carolina militiamen against Cherokee positions near the village of Etchoee in June 1761. Wood engraving, ca. 1844. (The Granger Collection)

On October 5, 1759, Gov. William Henry Lyttelton of South Carolina officially declared war against the Cherokees and prepared to lead an armed expedition of 1,300 men against them in the field. Word of this spurred several Cherokee chiefs, including Oconostota, to visit Charles Town (present-day Charleston, South Carolina) in an attempt to forestall hostilities. The chiefs were nevertheless taken prisoner by Lyttleton and marched under guard to Fort Prince George. There the governor met with Attakullakulla and demanded that 24 warriors known to have murdered settlers be turned over for punishment. The peace chief agreed to comply on December 26, 1759, and arranged the release of Oconostota. However, the remaining 24 chiefs and tribal leaders were to be retained as hostages.

A short truce ensued between the antagonists until February 16, 1760, when Oconostota lured the commander of Fort Prince George out into the open for a parley, and had him killed. The enraged British garrison then slaughtered all their hostages in retaliation, ending any chance for a peaceful, negotiated settlement.

For many weeks into the war, Cherokee bands raided and terrorized frontier settlements with impunity, forcing Lt. Gov. William Bull, Lyttlelton's successor, to appeal to Major General Jeffery Amherst, supreme British commander, for assistance. Amherst responded by dispatching several British regiments under Lieutenant Colonel Archibald Montgomery, who arrived at Charles

Town on April 1, 1760. Once augmented by supplies and militia, Montgomery marched 1,600 soldiers and militiamen to the relief of Fort Prince George. From there the force embarked on a punitive expedition against the Cherokee Lower Towns.

The British first moved against the nearby village of Keowee, which they devastated on June 1, 1760. They then proceeded against a bigger settlement at Echoe (in North Carolina). Here the Cherokees established an effective ambush, which was sprung on June 27, 1760. Montgomery suffered 20 killed and 70 wounded before driving off his antagonists, after which he withdrew to Charles Town.

Considering the disparity in numbers and equipment, this was a considerable Cherokee victory and inspired the Overhill bands of the tribe to continue fighting. Here Oconostota's war bands managed to blockade Fort Loudoun and starved it into surrendering. Captain Paul Demere, the commander, had been promised free passage back to English territory, but on August 8, 1760, angry Cherokees attacked his column, killing Demere and 32 others and taking the remainder hostage. This proved to be the largest humiliation for British troops during the entire war.

The loss of Fort Loudoun prompted Amherst to detail 2,500 British and Scottish troops under Lieutenant Colonel James Grant to Charles Town as reinforcements in the spring of 1761. Grant took to the offensive on March 20 by marching to Fort Prince George, where he conferred with Attakullakulla. The colonel brushed off the chief's

peace offer as being impossible to accept following the Fort Loudoun massacre, and then set about chastising the Cherokees further.

The British marched in force toward the Middle Towns, where, on June 10, 1761, only two miles from where Montgomery's force had been ambushed, the Cherokees launched another devastating attack. Grant managed to rebuff the warriors, driving them from the field, but at a cost of 10 killed and 50 wounded. The victorious British then spent an entire month systematically devastating native villages, crops, and fields, forcing upward of 5,000 Cherokees to flee into the wilderness. The natives proved unable to sustain this swath of destruction, and unable to secure assistance from neighboring tribes, many chiefs believed they had no recourse but to sue for peace.

Attakullakulla, Oconostota, and other tribal leaders subsequently conferred with Grant at Fort Prince George that fall, where a peace treaty was formalized on September 23, 1761. The treaty stipulated that the tribe would renounce and summarily cease all contacts with the French and recognize the sovereignty of English courts over wanted fugitives hiding on native land. It also pushed the South Carolina border 26 miles past the village of Keowee. The British also demanded that the Cherokees hand over several chiefs for execution. But Attakullakulla, having ventured to Charles Town to confer with the lieutenant governor, had this demand rescinded. A separate arrangement signed with Virginia on November 19, 1761, finally brought the Cherokee War to an end.

Afterward, the Cherokees and the British normalized relations to the extent that lingering anger and resentment on both sides allowed. The natives, in particular, had sustained considerable loss of life, displacement of entire communities, and the surrender of valuable hunting grounds. In their weakened condition, the Cherokees were unable to stem the rising tide of colonial encroachment along the frontier, despite the best attempts of British authorities to contain it east of the Appalachians. But whatever reservations they may have entertained against their former allies, the tribe trusted the emerging American nation even less. In 1776, perhaps thinking they had no choice, the Cherokees took up their war hatchets on behalf of Great Britain, and suffered commensurately for it.

Chesapeake, Virginia and Maryland Conflict over

Start Date: 1630s

End Date: November 1657

Clash between Virginia and Maryland, beginning in the 1630s, over contested land in the Chesapeake region. The 1632 charter that was granted to Cecilius Calvert, Second Lord Baltimore, established the Maryland Colony on the Chesapeake Bay, thereby reducing Virginia's territory by some 12 million acres. Members of the former Virginia Company objected to this enormous property transfer and tried to sabotage Calvert's plans by various means, including the incitement of mutiny among his sailors. Maryland's first colonists finally sailed in November 1633, in the charge of Leonard Calvert.

Approximately two years before, William Claiborne—a Virginia official as well as agent for an English company—had occupied Kent Island, located in the disputed area. Claiborne, accompanied by about 100 settlers, had built a fortified trading post and cleared land for a plantation. As the island lay well within the area granted to Lord Baltimore, Calvert offered Claiborne a license to conduct trade. But Claiborne accepted neither Calvert's terms nor Maryland's authority, arguing that he had settled the island before Lord Baltimore received his charter.

In April 1635, Maryland seized a small vessel for trading without a license. Claiborne sent a ship with orders to retaliate, and on April 23, it met two Maryland ships. The ensuing battle ended with three casualties and the surrender of Claiborne's ship. Claiborne's men won a second clash on May 10. However, because the scuffle was interfering with trade, Claiborne's English employers replaced him with a man more willing to cooperate with Maryland authorities. Claiborne retired to Virginia, where he continued to serve on the governing council, and bided his time. He appealed to London to certify his ownership, but received an unfavorable ruling in 1638. The Maryland assembly then passed an act calling for the confiscation of Claiborne's property.

The English Civil War and the subsequent execution of King Charles I provided Claiborne with several opportunities to regain his foothold in Maryland. When a supporter of Parliament, Richard Ingle, invaded Maryland in 1645, Governor Calvert fled to Virginia. Claiborne took advantage of the upheaval and reclaimed Kent Island. The period of Calvert's absence came to be known as the "Plundering Time." Calvert raised a militia and retook Maryland in 1646. Claiborne urged his Kent Islanders to continue fighting, but they accepted

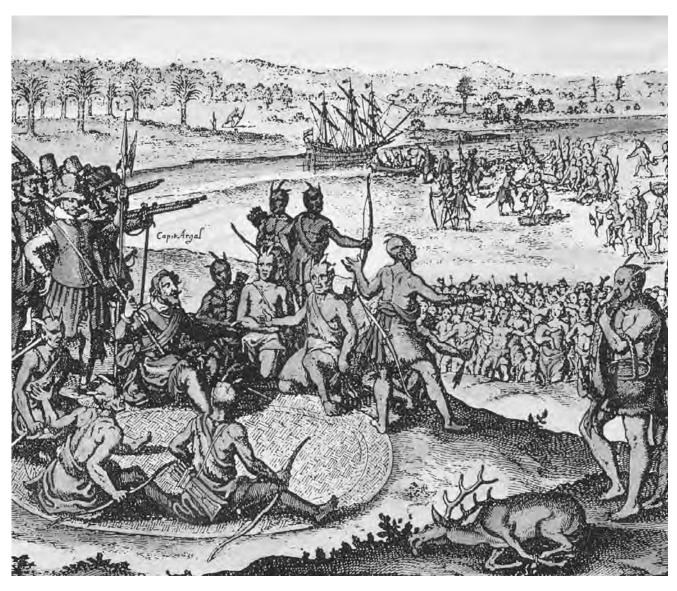

Calvert's offer of a general pardon. Claiborne tried again to reclaim his holding in 1649 by reporting to London that Maryland retained royalist sympathies. He then requested and received a commission from Parliament to "reduce" Maryland to obedience. Claiborne removed the proprietary governor, William Stone, from office in 1652, but the ensuing popular outcry compelled Stone's reinstatement.

Also in 1649, some 300 Puritans fled Virginia for Maryland, availing themselves of Maryland's legal guarantee of religious tolerance. In 1654 the Puritans called on Claiborne to return from Virginia to remove Governor Stone, whom they again accused of disloyalty to the Commonwealth. Claiborne and a fellow commissioner deposed the governor and replaced him with a Puritan council. The Puritan government subsequently restored to Claiborne his Kent Island property.

In England, Lord Baltimore obtained Lord Protector Oliver Cromwell's permission to retake control of Maryland and sent orders to Governor Stone to oust the Puritan government. In March 1655, Stone sailed toward the Puritan settlement on the Severn River with more than 100 men and a dozen vessels. On March 25, Stone and his men marched on the town and encountered a larger Puritan force. The Battle of the Severn ended when Stone surrendered after losing half his men. The Puritans executed four of their captives and held Stone and his council until Cromwell ordered their release. An agreement signed in November 1657 finally reestablished Lord Baltimore's authority and brought incursions by Virginians to an end.

Chickahominys

Native American tribe that lived between the Chickahominy River and the James River in eastern Virginia. The Chickahominys' territory extended into present-day New Kent County, Virginia. Essentially, their name means "coarse-pounded corn people" and may possess a connection to the word "rockahominy," a coarse cornmeal often consumed by Native Americans and later European colonists during hunting. The Chickahominys were Algonquian speakers and occasionally allied with the Powhatans, best known for their chief Powhatan and his early contacts with the English colonists. As with the Powhatans and other eastern tribes, the Chickahominys subsisted by hunting, fishing, trapping, and raising crops, corn in particular.

At the time of the English landings in Virginia in 1607, the Chickahominy tribe was already present in the region. Although the Powhatans vastly outnumbered the Chickahominys, the former were never able to gain complete suzerainty over the latter. By the same token, the Chickahominys did send men to fight alongside the Powhatans as a part of their alliance.

The alliance arrangement between the two tribes greeted the English on their arrival in Jamestown in 1607. Shortly thereafter, several Chickahominy warriors captured Captain John Smith as he explored the Chickahominy River. In accordance with their relationship to the Powhatan tribe, they turned the English captain over to Chief Powhatan. That set in motion the sequence of events that eventually led to a brief marriage alliance between the English and Powhatans via the union of John Rolfe with Powhatan's daughter Pocahontas.

Around 1615, after the First Anglo-Powhatan War (1610-1614), the Chickahominys negotiated a treaty with the English colonists, represented by Sir Thomas Dale. The Chickahominys made this peace with the colonists to preserve some of their autonomy in relation to both the Powhatan tribe and the growing English presence. One facet of the agreement included a promise to supply the English with military assistance when called on. Still, when forced to choose sides in the Second Anglo-Powhatan War (1622–1632), the Chickahominys chose to remain loyal to the Powhatans. As English settlements expanded, and native attempts to stop or slow down the growth of these settlements met with continued failure, the Chickahominys were reduced in numbers. They made a shaky peace with the English in 1632, which held until the outbreak of the Third Anglo-Powhatan War (1644-1646). That conflict saw the tribe lose much of its native territory to the colonists. The Chickahominys joined other groups in a forced relocation to the region known as the Pamunkey Neck. Later, in 1718, they were removed from this area as well.

The governing style of the Chickahominys was at variance with their native neighbors. As opposed to rule by a chief, or any other single dominant figure, the Chickahominys were ruled by a council of elders. Although many contemporaries commented on the different organization of the Chickahominy government, none left any real explanation as to how and why it was organized as it was. Through all of their travails, the Chickahominys managed to retain some of their tribal and cultural distinctiveness, and exist in the present day as an independently recognized tribal group.

Chickasaws

One of the so-called Five Civilized Tribes of the Southeast (in addition to the Cherokees, the Choctaws, the Creeks and the Seminoles). Sharing the Western Muskogean language family with the Choctaws, the Chickasaws settled primarily in present-day northern Mississippi. Based on their shifting fortunes in war and diplomacy, the Chickasaws also claimed territory extending into present-day Alabama, Kentucky, South Carolina, Georgia, and Tennessee. Consequently, they battled a wide assortment of tribes, including the Choctaws, the Cherokees, the Caddoans, the Shawnees, and the Illinois. Chickasaw military operations extended north beyond the Ohio River and as far south as the Gulf of Mexico.

The Chickasaws constructed permanent communities in Mississippi and Alabama that featured palisades for defense and space reserved for such public events as councils and athletic competitions. The primary unit of social organization for the Chickasaws was the house group, which was based on matrilineally related women residing with their husbands, children, and unmarried brothers. House groups functioned as part of larger clans, each of which took the name of an animal with which it identified based on spiritual visions.

The Chickasaw economy was a mixed one in which women tended crops and the men hunted, fished, and trapped. Trade with other tribes and the Europeans was also part of the Chickasaws' economic activities. Because the Chickasaws lived in towns, their population was concentrated. There were likely six to eight Chickasaw towns at the time of first European contact.

Placing a higher premium on mobility than the Choctaws, the Chickasaws heavily relied on horses for hunting, devoting relatively less energy to agriculture. As such, they helped pioneer equestrian warfare in the Southeast. Male prisoners taken in battle were usu-

ally executed, which left captured women and children as the primary sources of slaves. Nonetheless, the Chickasaws adopted a fair number of war captives to augment their population. By the middle of the 18th century, trade with the British had brought African slaves into Chickasaw communities.

Warfare served a variety of purposes for the Chickasaws. All males who fought in battle attained adulthood and prestige among their peers. Clans used raids to avenge homicides within their communities, as their law allowed for killing the culprit, and, in his absence, a male relative. In the event of a female victim, retaliation on a woman from the offending clan was acceptable. Separating military from civil leadership, larger campaigns were conducted by experienced war leaders who could only persuade fellow tribesmen to join them in combat.

Prior to battle, warriors fasted for three days in a hot house, consuming only herbal tea. Abstinence from sexual activity was also mandated. Several nights of ritualistic dancing culminated in a speech by a retired warrior, ceremonial smoking, and the striking of a red war pole. Each member of the expedition struck the pole while wearing full war paint and regalia.

In fighting colonial forces, the Chickasaws sought to employ tactics of ambush and surprise to avoid the conventional battle that favored European firepower. When both sides were ready to negotiate, the Chickasaws hosted enemy emissaries with elaborate entertainment. They passed a white calumet pipe among those assembled while the Eagle Dance was performed (with a heavy use of red and white colors to symbolize the duality of war and peace).

The ill-fated Spanish expedition led by Hernando de Soto initiated first European contact with the Chickasaws in 1540. Chickasaw-Spanish relations developed amicably at first, and the Spanish remained for about five months. But then de Soto demanded that 200 Chickasaw men serve as porters for travels that would ultimately take him to the Mississippi River. The Chickasaws refused to cooperate and assaulted the Spanish camp under cover of darkness. With the loss of roughly 40 men and nearly all of his equipment, de Soto was fortunate that the Chickasaws chose not to follow up on their initial attack.

During the colonial period, the Chickasaws were aggressively courted by the British, French, and Spanish as each colonial power vied for security and commerce in the region. The eclipse of Spanish influence in North America rendered this a two-way competition by the late 1600s. Although the French made progress in developing a friendly faction, the Chickasaws increasingly gravitated toward the British. This affiliation produced a flourishing trade of horses, guns, textiles, and metals for slaves and pelts.

As the Chickasaws' partnership with the British solidified, the French gradually discarded diplomacy in favor of brutal attacks. During the 18th century, they employed the Choctaws and other native clients to carry these out. Indeed, the French went so far as to hire Iroquois mercenaries from New York, but they never achieved a decisive victory. In fact, the defeat of two French armies at the hands of the Chickasaws helped to destabilize New France's

standing with their Algonquian allies. These periodic conflicts consumed precious French resources and lasted until France lost its hold on the North American mainland in 1763.

The Chickasaws briefly battled the English during Pontiac's Rebellion (1763). They also contested the Cherokees to the north. The Chickasaws backed the English during the American War for Independence. They did so in large part over fears of the relentless westward expansion of colonists.

During the war a promising development emerged in the form of a proposed confederacy of the Chickasaws, the Cherokees, the Choctaws, and the Creeks. They were all to attack the western frontier in conjunction with British forces. This ambitious campaign was forestalled when George Rogers Clark led an intrepid collection of American and French backwoodsmen to recapture a British outpost at Fort Sackville in Vincennes (now in Indiana). In the process, they seized supplies destined for Britain's Native American allies. Realizing that the proposed expedition was now a dead letter, the grand council for pan-Indian action never convened. The aborted plan proved to be a fateful episode for the Chickasaws.

The Treaty of Paris (1783) and removal of their British ally was a great blow to the Chickasaws. In what was at best a delaying tactic, they attempted to play off the Spanish and Americans against each other for commerce along the Mississippi River. By 1830, the Chickasaw Nation, a mere shadow of its former self in size, power, and cultural homogeneity, ceded its remaining territory in Mississippi. As they feared, the Chickasaw peoples had been decimated by white encroachment, sporadic warfare, and diseases brought to the continent by Europeans. They soon proceeded along the infamous Trail of Tears to Oklahoma.

Chickasaw Wars

Start Date: March 1736 End Date: April 1740

Major military campaigns in the American Southeast that reflected both the Anglo-French struggle for continental supremacy and the longstanding Choctaw-Chickasaw rivalry. Although the French committed more forces to these conflicts than in previous native encounters, they remained in search of a decisive victory over the Chickasaws that would deprive the English of a vital commercial

and military partner. In the end, the Chickasaw Wars contributed to the steady decline of New France in terms of strategic assets and its standing among native tribes.

The Chickasaw Wars followed on the heels of the Natchez War (1729–1733) that had pitted the French and the Choctaws against the Natchez and the Chickasaws, with the British assisting the latter coalition. By 1733, hostilities had subsided out of a recognition by most of the involved parties that regrouping was essential. Still chafing under French authority, the Choctaws mounted an independent assault on the Chickasaws in 1734. Roughly 600 warriors tricked the Chickasaws into leaving their forts and entering into an ambush. This bold strike convinced the Chickasaws to lobby harder for peace and to accede to a standing French demand to eliminate the Natchez, who had sought refuge within their territory. In 1734, it briefly appeared as though a lasting peace could be achieved because the Choctaws and the Chickasaws were exhausted and the French were stretched dangerously thin in maintaining their security commitments in North America.

In April 1735, however, a contingent of French soldiers transporting 1,700 pounds of gunpowder happened upon a larger force of Natchez and Chickasaws on a mission to rescue their captured women from the Illinois. The alarmed French quickly opened fire, which led to the defeat of both the soldiers and any hope for peace in the region. Although a delegation of Chickasaw chiefs employed diplomacy to return the French prisoners taken in the engagement, French resolve had hardened. The governor of Louisiana, Jean-Baptiste Le Moyne de Bienville, was finally prepared to launch a major French invasion of Chickasaw lands, a task previously relegated to the Choctaws. The French constructed Fort Tombeché (Alabama) along the Tombigbee River as a staging point for the assault.

By March 1736, Bienville had assembled about 460 French soldiers in addition to 100 Swiss mercenaries and 45 African slaves. He could soon expect a sizable Choctaw war party to arrive. But the French operation was plagued by a poor coordination of forces. In February Pierre d'Artaguette had departed from Illinois country with 145 French troops and a native contingent of 326 to include Iroquois, Miamis, Arkansas, and Illinois. By moving into Chickasaw territory ahead of the now delayed Bienville, the force tipped its hand that a major incursion was afoot. There is evidence that the French allies in d'Artaguette's force had grown disenchanted and deliberately discarded bread to reveal their presence. Running low on supplies, d'Artaguette opted in March to attack the Chickasaw village of Ogoula Tchetoka. The assault was thwarted, however, when 400 Natchez and Chickasaws arrived to outflank the invaders. D'Artaguette's native clients deserted him and he suffered serious injuries during what degenerated into a pell-mell retreat. Only a remnant of the original French force escaped as the Chickasaws made away with a considerable cache of gunpowder. French prisoners, including d'Artaguette and a Jesuit priest, were tossed into a fire; the Chickasaws viewed such treatment as an appropriate form of revenge and a means of purification. The captives might well have been spared, but word of Bienville's advance ruined any potential goodwill.

Unaware of this horrendous turn of events, Bienville began his assault along the Tombigbee River in May 1736. About 600 Choctaws joined him, including the devious chief Red Shoes, who periodically shifted his favor between the French and English. Bienville wished to locate the Natchez and quarreled with Choctaw chiefs who preferred to concentrate on the Chickasaws.

Choctaw guides misled the French and forced a battle against several Chickasaw villages in the vicinity of present-day Tupelo, Mississippi. At this site, the Chickasaws enjoyed the strongest defensive position in their entire nation as they retreated inside a collection of sturdy forts atop steep ridges. Bienville's initial attack was composed entirely of Europeans and gained little while absorbing heavy casualties. Bienville had his troops march in ranks with their officers prominently displayed in a classic example of losing a battle in the New World with tactics typical of the Old World. The attackers wore heavy woolen bags to protect them from musket fire, but suffered from shots aimed at their vulnerable legs. When the Europeans threw grenades, the defenders often retrieved them quickly enough to employ against the assault. Dumbfounded over the ineptitude of the French, the Choctaws joined the melee to no avail.

Having presided over the worst defeat ever inflicted on the French by Native Americans, Bienville began a retreat with his demoralized force that proceeded only four miles. He pleaded successfully with Choctaw chiefs for them to remain in his column. On returning to New Orleans, Bienville liberally placed blame for the fiasco with the Choctaws, his own troops, and the English. Authorities in Paris expected him to resume the offensive.

Allowing for time to marshal his forces, Bienville's second invasion did not begin until July 1739. In the meantime the Choctaws had grown more effective in raiding Chickasaw territory and consequently were more frustrated with French timidity. Learning from the French to concentrate on the destruction of crops and horses, the Choctaws had weakened Chickasaw morale to the point where there was strong momentum for peace. Sensing the weariness of their hosts, the Natchez grew increasingly uncomfortable residing among the Chickasaws. Anxious to support their clients, British agents helped to broker a settlement between the Chickasaws and the Choctaws in 1738 using the mysterious Red Shoes. But a rival Choctaw faction commenced hostilities and plunged the region into full-scale war yet again.

At Fort Assumption near present-day Memphis, Tennessee, the French had amassed enough gunpowder, artillery, and grenades to launch their greatest assault against the Chickasaws. Approximately 1,000 Frenchmen, 500 northern native mercenaries, and 1,000 Choctaws now lay under Bienville's command. But poor weather, illness, and desertion took its toll on this force before it ever saw battle. By February 1740, Bienville had lost too many horses and oxen to transport his cannon. He informed his already skeptical native allies that the French could not attack. This disclosure was particularly infuriating to the Choctaws, whom the French

had restrained from launching a major assault of their own despite recent success in raiding the Chickasaws.

Bienville agreed to provide about 200 French troops to accompany 337 natives for a reduced operation. Red Shoes dispatched warriors to alert the Chickasaws to the impending onslaught, but distrust among the Chickasaws rendered this initiative useless.

Pierre Joseph de Celeron commanded the French expedition that moved against Ogoula Tchetoka. Discovering a Chickasaw fort, the French endeavored to erect one of their own. Disgusted with what they perceived as the lack of an offensive spirit, the Choctaws abandoned the operation. Only frantic entreaties kept the northern natives on board. Negotiations produced a peace settlement whereby the northern warriors retired and the Chickasaws promised to deliver the Natchez.

The Choctaws remained free to battle the Chickasaws with French logistical support, and the Chickasaws allowed French commerce to resume along the Mississippi. By April 1740, Bienville left for New Orleans having achieved mixed results. The French had finally completed their quest for revenge against the Natchez for a revolt initiated in 1729 with the wholesale slaughter of colonists. But unable to produce decisive victories over the Chickasaws or compete with British traders for native commerce, the ongoing revelation of French weakness compromised its military, diplomatic, and economic operations throughout North America.

The peace of 1740 proved fragile in implementation. Northern warriors continued to harass the depleted Chickasaws, who were for the most part attempting to make good on their promise concerning the Natchez. Bienville continued exhorting the Choctaws to raid Chickasaw territory but was soon replaced as governor. Considerable strife lay ahead in the quest for supremacy among Europeans and natives in the Southeast.

Chignecto Isthmus

Neck of land connecting peninsular Nova Scotia to the Canadian mainland and a key front in the mid-18th-century wars between Great Britain and France in North America. Settled by Acadians from Port Royal in the 1670s, the Chignecto Isthmus became contested ground after the 1713 Treaty of Utrecht placed the French colony of Acadia under British rule. The treaty's language sparked a long struggle over the region. Although the British held that Aca-

dia—defined only by vague reference to its "ancient limits"—encompassed Chignecto, the French argued that the isthmus remained under the sovereignty of New France. Commissions and surveys failed to resolve the dispute, which by the early 1750s had devolved into a stalemate. By then several hundred Acadians and Micmacs inhabited the isthmus, settling in the central village of Beaubassin and smaller communities to the north and east.

Between 1750 and 1755, the Chignecto Isthmus played host to a confrontation that would not only contribute to the outbreak of the French and Indian War, but would lead to one of its most stunning campaigns, the forced removal of the Acadians from Nova Scotia. In 1749, the French ordered a prominent Jesuit, the Abbé Jean-Louis Le Loutre, to relocate his mission from interior Nova Scotia to Point Beauséjour, a spot of high ground on the west end of the isthmus. Drawing many of his Micmac communicants to a makeshift village, Le Loutre tried to spur Acadian migration from British Nova Scotia. Early in 1750, he went so far as to set fire to Beaubassin, driving its Acadian inhabitants toward Beauséjour, where the French planned to construct a fort. To halt what it termed incursions into British territory, the government at Halifax ordered Major Charles Lawrence to drive the French from the isthmus altogether. Two expeditions in April and September 1750 failed, but the British managed to build Fort Lawrence only a few miles from Le Loutre's village. The French sped up work on Fort Beauséjour, and by early 1752 the two structures faced each other across the Missaguash River, which became a de facto border between New France and the British Empire.

In the summer of 1755, Britain took steps to claim Chignecto entirely. Planned to coincide with attacks on Fort Duquesne, Crown Point, and Niagara, an assault on Fort Beauséjour (and the smaller Fort Gaspereau, located several miles to its north) was conducted by a combined force of British regulars and Massachusetts volunteers. Fort Beauséjour's defenders capitulated after a British bomb exploded inside a casement, killing an officer. After occupying the fort, the Anglo-American military leaders received orders from Charles Lawrence, now Nova Scotia's governor, to deport the Chignecto Acadians who had sided with the French. Lawrence soon amended his stance, demanding the removal of Acadians throughout his province. By the early 1760s, Chignecto had been almost entirely cleared of both Acadians and Micmacs, marking a key victory in Britain's campaign to eradicate French influence in North America.

Choctaw-Chickasaw War

Start Date: September 1752

End Date: 1752

Unsuccessful French-Choctaw campaign against the Chickasaws and the final in a series of nearly uninterrupted conflicts over the previous two decades between two longtime native rivals spurred on by European intrigues. The Choctaw-Chickasaw War of 1752 served as a futile last gasp in the French attempt to eradicate the Chickasaws as British allies in the American Southeast.

By the 1740s, the French-allied Choctaws had lost three successive wars to the Chickasaws. These setbacks severely damaged French credibility, but the Chickasaws had lost perhaps as much as three quarters of their population in the process. In 1742, Pierre de Rigaud de Vaudreuil, as newly appointed governor of Louisiana, inherited the onerous task of maintaining French interests in the region. The exhausted Chickasaws initiated peace overtures with the French in 1743, but Vaudreuil demanded cessation of all trade with Britain and the consent of the Choctaws as preconditions. The governor hoped to stall negotiations while awaiting reinforcements with which to tame the Chickasaws. But French priorities lay elsewhere, and the reinforcements never arrived. With diplomacy stymied, both the Choctaws and the Chickasaws resorted to periodic raids while pressing their respective European allies for more trade as an inducement to continue fighting.

The French paid Choctaw warriors for Chickasaw scalps, and Chickasaw prisoners were made available for enslavement. Vaudreuil's alleged commitment to peace appears even weaker in light of instructions he received from Paris in 1751 to encourage internecine warfare among the Choctaws, his own allies. The governor had no moral qualms in executing this policy, but he worried that the Choctaws would recognize his strategy as a means of rendering them more dependent on the French. As the Choctaw tribe bickered over which European power to favor, a civil war ensued from 1746–1750 with the French faction emerging victorious.

In the meantime, British naval exploits during King George's War (1744–1748) reduced French supplies to the point where the Choctaws felt little incentive to attack their neighbors at the behest of New France. As Chickasaw raids had now intensified, the French finally convinced the unenthusiastic Choctaws to act in 1752. Scholars disagree on the number of French troops involved in the Choctaw-Chickasaw War, with estimates ranging from 700 to as few as a handful.

The Choctaw-dominated invasion force moved along the Tombigbee River (located in modern-day western Alabama) in September 1752, just as the French and the Choctaws had done during an earlier war in 1736. The Chickasaws refused to engage their enemies in a conventional battle that would likely have favored the invaders, however. The result was a hit-and-run, guerrilla-style war, with most of the Chickasaws remaining in their well-fortified towns. As such, the French and the Choctaws settled for razing deserted villages and depriving the Chickasaw of crops and livestock. The 1752 war concluded without any alteration in the regional balance of power. France's eviction from the North American mainland in the Treaty of Paris (1763) ultimately ensured Chickasaw dominance over the Choctaws.

Choctaw Civil War

Start Date: 1746 End Date: 1750

Intertribal conflict among the Choctaws precipitated by the ongoing Anglo-French rivalry. The Choctaw Civil War ensued when Choctaw war chief Red Shoes, a longtime ally of France, switched allegiances to Britain. The civil war can also be seen as one more conflict along with King George's War (1744–1748) in the colonial competition between France, England, and Spain in North America that decimated the indigenous peoples.

Though the French had been in North America a few years longer than the British, they and the British had only arrived in southeastern North America in the early 1700s. Spain had older, albeit more contested, ties with powerful southeastern tribes such as the Choctaws and the Chickasaws. The arrival of the French along the Gulf coast (Choctaw territory) and the British in inland Chickasaw territory led to logical trade alliances between the French and Choctaws and the British and the Chickasaws. French colonists who had trouble inland with the Natchez and the Yazoos turned to their Choctaw allies for help. The resultant decimation of the Natchez tribe and the establishment of New Orleans in 1718 further advanced French-Choctaw alliances. Because New Orleans then functioned essentially as a port of illicit trade and piracy, it also served to bring the French and the Choctaws into conflict with the British-Chickasaw alliance and Spain.

Neither France nor England wanted the age-old Choctaw-Chickasaw rivalry to end. Nevertheless, in 1741 the Choctaw chief Red Shoes tried to negotiate a treaty between the two tribes, perhaps realizing that their real enemy was the ever-growing number of European colonists. Both British and French representatives worked feverishly to thwart the treaty, and French governor Pierre

de Vaudreuil was successful in doing so by 1744. However, bad blood eventually emerged between Vaudreuil and Red Shoes, and it would have serious future consequences.

In 1744, the Franco-British rivalry erupted into King George's War (1744–1748). During the conflict, the British fleet blockaded New World shipping. The blockade had little effect on French colonists, who by this time were self-sufficient. However, it did have a major impact on France's ability to supply European goods to its native allies. As a result, some Choctaw chiefs, headed by Red Shoes, asked the British to open trade, especially for guns, which were vital to Choctaw survival.

As with most Native American groups, the Choctaw Nation was a complex political unit in which each part had some autonomy in certain domestic and foreign affairs. The Choctaws consisted of about eight tribes and many clans, perhaps numbering 40,000 people in all by the mid-18th century. Some groups remained loyal to the French, others sided with British traders, and still other groups remained neutral.

From 1746 to 1748, Red Shoes remained in control with British support. But discontent was rising within the Choctaw Nation. Governor Vaudreuil ultimately conspired with Red Shoes's Choctaw rivals to murder Red Shoes in June 1748. A full-blown Choctaw Civil War then ensued.

The second phase of the civil war from 1748-1750 saw the brother of Red Shoes carrying on the intertribal conflict with British support. Ultimately, the French faction dominated and won the Choctaw Civil War outright by September 1750. In the end, British support for the Choctaws who had allied with them was minimal as the British stood to win either way. The British certainly did not want to incur the wrath of their longtime allies the Chickasaws by supporting the Choctaws. Yet the British hoped to reduce French-native power in the region. The Choctaw Civil War served both purposes, making the British the clear winners. The British went on to defeat a weakened French-native alliance in the French and Indian War (1754–1763). In a sense, the civil war was a precursor to the much larger Franco-British conflict. The Choctaw Civil War and disease combined to decimate the formerly powerful southeastern tribe. Usually able to field around 3,000 warriors and up to 600 in a single battle well into the 1700s, the Choctaws emerged from the civil war with fewer than a third that number.

Choctaws

Native American group whose territory included east-central Mississippi as well as parts of Alabama. The Choctaws were one of the so-called Five Civilized Tribes of the American Southeast (along with the Chickasaws, the Creeks, the Seminoles, and the Cherokees). The Choctaw Nation traditionally resisted developing dependency on Europeans, whereas the English, French, and Spanish vied for resources and influence among indigenous peoples.

The Choctaws had developed a multi-ethnic confederacy in present-day east-central Mississippi by the late 17th century. Reputedly the one-time brethren of the Chickasaws, the Choctaws became renowned farmers and fierce warriors. Because of their agricultural prowess, they enjoyed a diverse economy that also included hunting, fishing, gathering, and trapping. Their competitiveness manifested itself in a rough version of stickball known as *toli*, or "little brother of war." These contests trained men for battle and sometimes settled political disputes. Opposing towns sometimes used witchcraft to influence the outcome.

Four social ranks differentiated Choctaw males. The grand chiefs, village chiefs, and war chiefs occupied the highest rung. Under them were the *hatak holitopa*, or "beloved men." The *tashka* ("warriors") held the third level. At the bottom were the *hatak imatahali*, "youth" or "supporting men," who had not seen combat or had slain only women and children. The political organization and social structure of the Choctaws centered on the *iksa* (clan), with their matrilineal kinship networks. Traditional political power hierarchies tended to be weak, however.

The size and central location of the Choctaw Nation rendered it strategically vital for imperial ambitions in the region. The French secured the first sustained European contact with the Choctaws through a trading post, which prompted the English to befriend the adjacent Chickasaws and Quapaws with the promise of weapons in exchange for Choctaw slaves. By 1699, the Choctaws had lost nearly 2,000 people to English-inspired slave raids and military assaults. In 1702, the Choctaws allied with the French to gain firearms. However, a lack of immunity to European diseases reduced their population by roughly 5,000 within 15 years of continuous exposure. The British, in 1711, along with the Chickasaws and the Creeks, launched a major campaign that inflicted on the Choctaw losses to death and slavery in excess of 400. But after 1715, when the British had faced a rebellion of their own among Native Americans, an effort was begun to entice the Choctaws to abandon the French.

An 18th-century sketch of Choctaw warriors and children. During the colonial era, the Choctaw occupied substantial portions of present-day Mississippi and Alabama. (Corbis)

Because indigenous slaves were perishing rapidly in South Carolina, the British favored commerce with the Choctaws while increasing the importation of African slaves. The French countered with an increasingly large volume of gifts to selected Choctaw chiefs. But a lack of effective hierarchy in Choctaw society rendered these expenditures ineffective in securing strong influence. Indeed, Choctaw chiefs routinely redistributed European goods to their people. Thus they perceived French gifts in terms of their own cultural interpretation as an affirmation of friendship. But French authorities grew to resent what they deemed an arrogant expectation of tribute.

Financial strains on New France in the early 18th century reduced its generosity as officials resorted to bypassing civil chiefs in favor of direct scalp bounties to warriors. The British had their own difficulties thanks to a bloody uprising known as the Yamasee War (1715–1717). The Choctaw alliance with the French was solidified in the aftermath of the Natchez Revolt (1729) in which French settlers along the Mississippi River were slaughtered and enslaved. The Choctaws played an important role in exacting retribution on the Natchez in the conflicts of the early 1730s. Because some of the Natchez had fled to the Chickasaws, the French aimed to eradicate the Natchez and compel the Chickasaws to renounce their alliance with the British. The French then constructed a fort in Choctaw territory along the Tombigbee River and initiated two unsuccessful wars with the Chickasaws.

By the mid-18th century an intense effort by the French and British to curry favor among the Choctaws had plunged the nation into civil war. French officials showered the war chief Red Shoes (Shulush Homa) with gifts and medals to help him supplant civil chiefs and turn him into a pliable client. But the ambitious leader created an independent power base from which to play the French and the British off against each other (as well as against Choctaw factions) during the 1730s with a series of intricate diplomatic maneuvers. When Red Shoes parleyed with the British and the Chickasaws in 1745, the French arranged for the murder of several delegates. Red Shoes retaliated by ordering the slaying of a French officer and two traders the following year. The Choctaw system of justice did not prescribe death for the perpetrators despite the fact that the French had executed two of their own in 1738 for the murder of a Choctaw couple. The Choctaws attempted to placate the French by killing more of the Chickasaws and the British, but internal divisions deepened.

Meanwhile, the British hoped to compel more trade with the Choctaws. But they required only a small range of goods—generally clothing, textiles, metal tools, and blankets. The British consequently promoted rum and the credit necessary to purchase it as a means to create commercial dependency. Numerous Choctaw hunters soon languished in debt as they desperately sought the animal pelts necessary to settle accounts. Feeling betrayed over a partnership with few dividends, the French hired an assassin who murdered Red Shoes in 1747. A civil war ensued as no other leader could maintain his delicate equilibrium of power and diplomacy. The conflict was slowed by a smallpox epidemic, but the pro-French faction ultimately triumphed.

Following the Treaty of Paris in 1763, the French eviction from the North American mainland left the Choctaws vulnerable to attacks from their neighbors. For more than a decade the British periodically agitated the Creeks into attacks. But the Choctaws subsequently used the threat posed by Spanish Florida to gain commercial and diplomatic advantages with the British. Choctaw warriors joined British forces arrayed against the Spanish during the American Revolutionary War, but meager pay and supplies led nearly all of the fighters to depart before battle. The Choctaws were forcibly removed from their ancestral lands by the U.S. government to the Oklahoma Territory during the first half of the 19th century.

Chubb, Pasco

Born: ca. 1664

Died: February 22, 1698

New England militia officer during King William's War (1689–1697) known for his treacherous dealings with Native Americans and the surrender of Fort William Henry in Maine. The son of English immigrants, Pasco Chubb was born in Beverly, Massachusetts, about 1664. He settled in Andover, Massachusetts, and went on to serve as a captain in the Massachusetts Bay Militia during King William's War, eventually becoming the commander of Fort William Henry at Pemaquid, Maine, in late 1695.

In spring 1696, a party of Abenakis approached the fort at Chubb's invitation to treat with the English. After several days of peaceful dialogue and trade, Chubb's soldiers fired on the natives, killing two, including Egeremet, a leading peace advocate among the Abenakis, and capturing several others. Chubb and his men may have acted so deplorably in hopes of collecting high bounties placed on native scalps and prisoners.

Only months later, in August 1696, a combined force of Abenakis and Frenchmen retaliated by attacking Fort William Henry. Chubb vowed to defend the fort to the last, but when the French began lobbing mortar shells into the works, he quickly negotiated safe passage for his garrison and surrendered the fort. The French gave their allies the fort's arms, ammunition, and supplies and then destroyed the supposedly impregnable bastion.

Born in Plymouth Colony in 1639, Benjamin Church was a highly successful military leader who advised adopting Native American ways of war. (Library of Congress)

Returning to Boston, Chubb found himself vilified for his cowardice, charged with treason, and imprisoned for several months. Once released (without being tried, however), Chubb again settled in Andover, where he died in a Native American raid on February 22, 1698.

Church, Benjamin

Born: 1639

Died: January 17, 1717

New England soldier and frontiersman, and the first of the "border captains" who figure so prominently in the history—and mythology—of the colonial wars against Native Americans. Benjamin Church was born in 1639 at Duxbury in Plymouth Colony, the son

of a carpenter and veteran of the Pequot War (1636–1638). To the dismay of the more conventional English soldiers in Plymouth and Massachusetts Bay colonies and the Puritan divines, particularly Increase Mather, Church counseled adopting Native American ways of fighting (the so-called skulking way of war). He also urged use of Native American allies to defeat King Philip (Metacom) and his warriors in King Philip's War (1675–1676). Church practiced what he preached. He taught colonials under his command to move silently through the forests and swamps, to "scatter" as the Native Americans did if attacked, and to "never fire at an Indian if you can reach him with a hatchet."

Ranging through Massachusetts and Rhode Island, his mixed band of Native Americans and handpicked Plymouth soldiers burned enemy villages and crops and took many native prisoners. Finally, on August 12, 1676, Church and his rangers tracked the Native American leader King Philip to his camp near Mount Hope, Rhode Island, and killed him when he tried to escape. The dead chief's head was cut off and taken to Plymouth, where it remained atop a pole for some 25 years as a trophy of English victory. For his exploits, the Plymouth authorities awarded Church the sum of 30 shillings.

Church frequently fell out with colonial leaders over treatment of native foes during the war. On more than one occasion, Native Americans he had convinced to surrender or who had been captured were sold into slavery, to his great fury. This was the fate of King Philip's wife and son, taken by Church and his rangers 10 days before they killed the Native American leader.

When King William's War broke out in 1689, Church was commissioned a major and led Plymouth forces in the fight against the French and their Native American allies in Maine, then part of Massachusetts Colony. His troops participated in the Battle of Brackett's Woods, which helped lift the siege of Fort Loyal. Church led three more expeditions into Maine and what is today New Brunswick, Canada, in 1690, 1692, and 1696. These were in retaliation for French and Native American raids against the eastern borders of New England.

In March 1704, although by now a rotund 65 year old, Church was granted a commission as colonel of Massachusetts troops and was ordered to raid into Acadia. The raids were in revenge for French and native destruction of the town of Deerfield, Massachusetts, the month before. Fortified by a promise of £100 for each Native American scalp, moving from place to place by whaleboat and taking to snowshoes when necessary, Church's 550 New England volunteers attacked native villages, seized and burned the towns of Les Mines (Grand Pré) and Chignecto, and threatened the French base at Port Royal.

The Acadia raid was Benjamin Church's last campaign. He retired to his farm at Little Compton, Rhode Island, where he and his son Thomas composed the two volumes of his memoirs of King Philip's War and the struggles against the French and Native Americans, the primary material for which was a diary Church had kept over the years. The volumes are noteworthy for the author's insistence on the importance of human agency—his own, primarily—in the victories

William Claiborne, Jamestown colonist, trader, and prominent colonial leader. (Cirker, Hayward and Blanche Crirker, eds., *Dictionary of American Portraits*, 1967)

of the colonists over their enemies. Other contemporary historians of the wars, such as William Hubbard and Cotton Mather, had seen the triumphs as evidence of God's will. Publication of his memoirs made Church a model for other "border captains," such as Robert Rogers, to follow. Church died on January 17, 1717, near his home at Little Compton, Rhode Island.

Claiborne, William

Born: 1600 Died: 1677

Virginia trader and colonial official. William Claiborne's date of birth is unknown, but he was baptized in Crayford Parish, Kent, England, on August 19, 1600. Claiborne emigrated to North America and became a trader in Virginia. Traveling from that colony to the upper eastern shore of the Chesapeake Bay, Claiborne established a trading post on Kent Island in 1631. He represented a London trading company, Cloberry and Company, and held several offices in the Virginia government including secretary of state (1626–1634 and 1652–1661), deputy governor (1652–1660), and councilor (1624–1637 and 1643–1661).

Claiborne was a leading opponent of the Calvert family's 1632 proprietary charter for the colony of Maryland. When the first Maryland ships arrived in 1634, Claiborne's trading post had a population of about 100 people. His fortified settlement was obviously within Maryland's colonial territory, but Claiborne claimed that the Island was excluded from the Calverts' territory because the charter only granted them unsettled land.

Claiborne and the Calverts failed to negotiate a settlement to this dispute. Instead the conflict escalated to armed confrontation in April 1635. Near the mouth of the Pocomoke River, two proprietary ships defeated a vessel loyal to Claiborne, the *Cockatrice*, on April 23. Two weeks later, however, Claiborne's forces prevailed in a second naval battle also near the Pocomoke River.

Cloberry and Company officials, fearing that this dispute could diminish trade, replaced Claiborne in 1637 with an agent willing to negotiate with the Calverts. Claiborne, however, claimed Kent Island again in 1645 during the absence of Maryland's governor, Leonard Calvert. Support for Claiborne collapsed when the governor returned with an armed force in 1646.

Claiborne returned to Maryland from Virginia once more in 1654 during England's Interregnum period to deliver orders enforcing parliamentary allegiance and demanding Puritan rule in the colony. This time he declined to press any claims to Kent Island. Claiborne died at Romancoke, his New Kent County, Virginia, home, shortly after sending a final petition in March 1677 to King Charles II seeking the return of Kent Island.

Clark's Garrison, Battle of

Event Date: March 12, 1676

Key engagement in the Native American uprising in New England known as King Philip's War (1675–1676), occurring on March 12, 1676, in Plymouth Colony. The Battle of Clark's Garrison helped reshape colonial military tactics and the treatment of combat in the New England legal system. Indeed, after the attack, English settlers had concluded that only the heavy use of indigenous forces, hit-and-run operations, and vicious treatment of enemy captives would subdue the rebellion and prevent similar occurrences.

During the height of King Philip's War, numerous surprise attacks on lightly defended colonial outposts terrorized New Englanders. Such was the fate of a garrison house located several miles south of Plymouth owned by William Clark. The eldest son of a wealthy Boston importer, Clark appears to have been targeted because local natives knew of his military supplies through an ongoing commercial relationship. The home was fortified to serve

as a common defensive position in the event of hostilities, but archaeologists have not found any evidence of palisades. When warriors attacked the garrison, settlers offered little resistance because most males were attending a Sabbath meeting. One of Clark's sons, Thomas, was left for dead with a tomahawk wound. He later recovered to spend the rest of his life with a silver plate attached to his head.

Accounts of colonial fatalities ranged as high as 11 and included Clark's wife, Sarah. Casualty figures may have been inflated by the powerful and imposing minister Increase Mather, who used the war as a sign of divine retribution for the failure of Puritans to maintain their special covenant with God. Because the victims had not respected the Sabbath, Mather characterized the Clark's Garrison tragedy as a lesson to those who succumb to materialism. He was contributing to a growing sense of declension that gripped New England and preoccupied Puritans who already believed that nothing happened by chance.

The number of native attackers remains unclear, as Mather's records do not match those of the Plymouth General Court. In September 1676, colonial troops produced a collection of surrendered natives to Plymouth magistrates with confessions that three of them had participated in the attack on noncombatants at Clark's home. A purported testimonial from a native woman augmented the case, and the accused were put to death without regard to their status as prisoners of war. In effect, the Plymouth General Court regarded this attack as a crime against humanity as civil authorities swiftly discarded military distinctions in their rulings.

With the conflict dissipating after the death of the charismatic Metacom (Metacomet or King Philip) in August 1676, New England courts increasingly used their power as a form of vengeance to conclude what had become a war of attrition. Soon, New England Native Americans would no longer enjoy their status as sovereign nations, as treason ranked among the charges leveled against them.

Cockacoeske, Queen of the Pamunkeys

Born: Unknown Died: 1686

Pamunkey leader who remained loyal to Virginia's colonial leaders during English conflicts with native peoples. Cockacoeske became the Pamunkeys' *weronsqua* (or female leader) in 1656 after her husband, Totopotomy, the tribe's leader, died in battle fighting neighboring natives hostile to the colonial government.

In 1676, Cockacoeske appeared at the Virginia General Assembly with an interpreter and her son, John West. When assembly members asked Cockacoeske to supply warriors to help defeat Nathaniel Bacon's rebellion (1676–1677), she remained quiet, then yelled her husband's name when pressured to commit forces. She then stated that the Pamunkeys had in the past sacrificed for government causes without reparations. When officials continued to request troops, she finally agreed to provide 12 warriors.

When Bacon's forces raided Pamunkey villages, Cockacoeske told her people to flee and not fight. Rebels captured and killed several natives. Terrified when she saw the carnage and destruction wrought by the raids, Cockacoeske hid in nearby woods for days. On February 20, 1677, she asked that the General Assembly recover seized Pamunkey property and land and compensate her people. Assembly members countered that she had to prove that the items belonged to the Pamunkeys. Cockacoeske pressed her demands directly with King Charles II's commissioners. In due course, they instructed the Assembly to assist her because they realized full well that the government needed her as an ally.

During negotiations for the 1677 Virginia-Indian Treaty (also known as the Treaty of Middle Plantation), Cockacoaske secured terms favorable to expand her power. The treaty stated that she was the leader of the Pamunkeys and several nearby tribes. Cockacoeske aspired to create a confederacy similar to that created by Powhatan. The uncooperative tribes did not pay the tributes she demanded,

Frenchman Jean-Baptiste Colbert, minister of finance under King Louis XIV. A strong proponent of mercantilism, Colbert favored the establishment of overseas colonies and a strong navy. (Ridpath, John Clark, *Ridpath's History of the World*, 1901)

however, insisting that they had not agreed to such stipulations. Cockacoeske complained to colonial officials but did not achieve her ambitions before her death in 1686.

Colbert, Jean-Baptiste

Born: August 29, 1619 Died: September 6, 1683

French minister of marine, regarded as the founder of the modern French Navy. Born in Reims, France, on August 29, 1619, Jean-Baptiste Colbert was first a lawyer's clerk and then worked in a financial firm. In 1640, he joined the Ministry of War, and in 1642 he became chief clerk to Michel Le Tellier, who installed him as his secretary when he became counselor of state. From 1651, Colbert performed a variety of duties for Cardinal Mazarin, chief minister to King Louis XIV. Beginning in 1660, he became interested in naval affairs and took over its administration, and in 1669 he was formally granted the title of minister of state for the navy.

As controller general of finances, in effect chief minister to King Louis XIV, during 1665-1683 Colbert worked hard to apply mercantilist principles, seeking to make France economically self-sufficient and increase the wealth from which state taxes were drawn. Toward this end, he encouraged the development of industry and worked hard to increase the manufacture of luxury goods and exports in order to achieve a favorable balance of trade. Colbert abolished many internal tariffs, promulgated a commercial code and marine code, and significantly improved communication within France by the construction of roads and canals. He also fostered colonies abroad, and in 1664 he established the French East India and West India companies for trading with India and America respectively. His efforts to encourage immigration to the French colonies met only partial success because, unlike the English, the French government refused to allow religious dissenters to emigrate to New France. In the naval sphere, Colbert sought to implement Cardinal Richelieu's plans to build a powerful navy. He took over what was a moribund naval establishment, and his substantial effort in this area merits recognizing him as the father of the modern French Navy. Colbert's naval program embraced all aspects of the navy, including supplies, administration, creation of ports and dockyards

Important Items in the Columbian Exchange

New World to Old World	Old World to New World

Syphilis	Pigs
Tapioca	Rice
Tobacco	Smallpox
Tomatoes	Sugarcane
Turkeys	Wheat

(such as Rochefort), organization (creation of marine infantry), standardization of ship classifications and gun calibers (in which he was ahead of his time), establishment of hospitals, and the promulgation of ordinances in 1681 and 1689, which codified the merchant marine and the navy. He also worked to encourage the building of ships for the merchant marine. Colbert's chief shortcomings as minister of marine were to regard the navy too much from an administrative point of view and to give too much authority to administrators rather than its line officers.

Colbert was one of France's greatest financial reformers and organizers. Hard working and humorless, he did increase state revenues. He also understood what the king did not, that France needed peace to put its financial house in order. Colbert was thus a staunch advocate of peace, save in the case of the Dutch War, for which his commercial policy was partly responsible. Colbert was never able to overcome the growing expense of King Louis XIV's many wars and was thus forced to raise taxes sharply. He died at Paris on September 6, 1683.

Columbian Exchange

Initiated by Christopher Columbus's voyage to the New World in 1492, the Columbian Exchange involved the exchange of people, flora, fauna, diseases, and ideas between the Eastern and Western Hemispheres. This changed the world's ecosystems and gave Euro-

134 Columbus, Christopher

peans distinct advantages over Native Americans, ultimately allowing European peoples to conquer and subdue the New World. Native American plants such as maize (corn), squash, beans, potatoes, and tomatoes were introduced to Europeans. These crops, especially maize and potatoes, helped prevent famine and stimulated population growth in Europe and Africa, which aided the European conquest of the New World. In return, Europeans and Africans introduced wheat, rice, bananas, sugar, and wine grapes to the Americas.

Many European colonists used these Old World crops along with the New World cultivation of tobacco as cash crops to create viable economies that sustained their colonies. Europeans also introduced domesticated animals such as cattle, fowl, horses, hogs, and sheep to the New World. Unfortunately, disease proved to be perhaps the most significant element introduced to the New World, and it was also the single most destructive aspect of the Columbian Exchange for Native Americans. Europeans unintentionally brought with them influenza, malaria, measles, plague, and smallpox. Because Native Americans had no previous exposure to these diseases and had not acquired immunities to them, they suffered very high mortality rates once infected. Often, aspects of colonialism such as warfare and the Native American slave trade helped

spread diseases and contributed to the devastating impact they had on native societies.

Columbus, Christopher

Born: 1451

Died: May 20, 1506

Italian-born navigator and explorer. Born Cristoforo Columbo in Genoa, Italy, in 1451, Columbus received little or no formal education in his youth. Indeed, he never wrote in Italian, although he did learn to read and write in both Spanish and Portuguese. Columbus spent much of his youth working as an apprentice to his father, who was a master weaver and part-time wine-shop owner, but by his own account, Columbus took to the sea at a "tender age."

At the age of 19, Columbus made his first trading voyage in the Aegean Sea. In his early twenties, he began to make longer voyages to Marseilles, Tunis, and the Greek isles. In 1476, Columbus set out for Flanders and England, but his vessel was sunk by French privateers. He landed penniless in Portugal and was taken in by one of many Genoese living in Lisbon. There Columbus acquired most of his knowledge of navigation.

Although the Portuguese were in the process of developing a trade route to India by sailing around Africa, Columbus advocated sailing west to reach the Indies. Inspired by the writings of Florentine cosmographer Paolo Toscanelli, Cardinal Pierre d'Ailly's *Image of the World*, and Marco Polo's account of the Far East, Columbus believed that the Earth's circumference was much smaller than it actually is and that a western route would be shorter. When the king of Portugal rejected Columbus's proposal to finance the voyage, he turned to King Ferdinand V and Queen Isabella I of Spain, who in April 1492 agreed to sponsor the expedition. Commanding the *Santa Maria*, the *Pinta*, and the *Niña*, Columbus departed Spain on August 3, 1492, and after a trying two-month voyage reached the island of San Salvador in the Bahamas on October 12. After landing on Cuba and Española (later called Hispaniola), where he left a garrison of 40 men, Columbus returned to Spain in 1493.

On his return, Isabella commanded Columbus to sail again immediately. He embarked on a second expedition with 17 ships and 1,000 colonists in September 1493. On returning to Española, he discovered that the garrison he had left behind had been killed by the natives. Columbus established the colony of Isabella near modern Cape Isabella in the Dominican Republic, and he landed on Dominica, Guadeloupe, and Antigua and explored the coast of Cuba. Before returning to Spain in 1496, Columbus founded Santo Dominigo as the capital of Española.

In May 1498, Columbus, who still believed he had reached Asia, set out on his third expedition. He landed on the island of Trinidad and sighted what is now Venezuela, discovering the continent of South America. When he arrived in Santo Domingo, Columbus found the colony of Española in revolt. Across the Atlantic in Spain, discontented colonists successfully persuaded Ferdinand and Isabella to remove Columbus as governor of Española in May 1499 and appoint Francisco de Bobadilla to establish order in the colony.

Columbus was subsequently arrested and sent back to Spain in chains. On his return, Isabella pardoned Columbus but refused to restore him to office as governor of Española.

In May 1502, Columbus ventured on his fourth and final expedition. Hampered by a hurricane, he managed to reach Honduras and searched in vain along the Central American coast for a passage across the continent to Asia. In January 1503, Columbus landed at Panama and established a colony there. In June that same year, his fleet was marooned near Jamaica. After returning to Spain in 1504, Columbus found he had lost not only his title as governor of the Indies but his chief support in the person of Isabella, who had died earlier that year. Suffering from arthritis, humiliated, and frustrated by the elusive fame and wealth that he had so fiercely sought, Columbus died in Valladolid, Spain, on May 20, 1506.

Although Columbus's discovery of the Americas presented undreamed-of opportunities for Europeans, it also marked the beginning of several centuries of famine, disease, dislocation, and violence for the Native American peoples already living in the Western Hemisphere.

Committee of Militia (Massachusetts Bay)

Command structure set up by Massachusetts Bay (and copied by other New England colonies) to ensure civilian control of militia units. Although most of the command structure of early American militias was directly borrowed from the English practice, certain changes occurred in the colonial militias that made their command structure different from that of the mother country. Retaining vivid memories of abuse suffered at the hands of militia units under command of powerful lord lieutenants in Stuart England, the Puritan leaders of New England sought to avoid any kind of military abuse of power in the New World. Thus, the position of lord lieutenant was never established in America, despite its prominent place in the English militia system.

To ensure civilian control of the military, most New England militias relied on the civilian nature of the militia and the popular election of militia officers. When in the 1640s militia elections caused unrest in a growing number of communities, because the candidates did not always have proper qualifications for office, the General Court of Massachusetts Bay began to question the system of military safeguards and explore other options.

Concern over the Anglo-Dutch War of 1652–1654 prompted the General Court to establish a new command structure to oversee the

militia in Massachusetts towns; they called the new groups Committees of Militia. Made up of the town magistrate and the top three military officers in the town (or the town's deputy to the General Court and three officers), the militia committee was to oversee its town's militia. This added yet another layer of civilian control over the military. One of the major duties of the committees was to suppress all raising of soldiers except those authorized by the colony's government; the General Court had doubts that elected officers could carry out such an obligation.

Over subsequent years, the Committees of Militia gained more power; most important, they were tasked with the power to impress men for active military duty. The committees became even more powerful with the demise of the election of militia officers in 1668.

During King Philip's War (1675–1676), the committees received more authority as the war escalated. By the end of the conflict, they controlled virtually all aspects of town public life. They supervised fortifications, assigned inhabitants to garrison houses, secured arms and ammunition for the town, set war taxes, controlled impressment, punished those who avoided military service, selected who could and could not evacuate towns, set watch and ward (town patrol) responsibilities, and nominated local commanders. Town selectmen had hardly any duties left to perform in their respective

towns. By the end of King Philip's War, the town Committees of Militia were second only to the governor and the General Court in importance within the military command structure of the colony.

During the Imperial Wars of the early 18th century, Committees of Militia continued to function. They persisted in impressing men for duty and overseeing town defenses. They were, however, never as vital as they had been in the days of King Philip's War. With the increasing use of British regular troops in the 18th century and the establishment of bounties and the voluntary enlistment system for provincial forces, the committees lost much of their function, and most disappeared by the 1740s or 1750s.

Connecticut

Area between New Netherland and Massachusetts, principally encompassing the fertile Connecticut River Valley. The Dutch colony of New Netherland and the two English colonies in Massachusetts contended for control of the Connecticut River Valley during 1633–1653. The contest began when Edward Winslow of Plymouth Colony explored the Connecticut River Valley in 1632. The following year, Dutch traders built Fort Good Hope, near present-day Hartford. The Massachusetts Bay Colony constructed a rival post nearby. The two posts vied for primacy with their native trading partners and directly challenged each other, without opening fire, on several occasions.

At first contact, some 5,000 Algonquian-speaking Native Americans belonging to roughly 16 tribes lived in the area that became Connecticut. The most powerful of them, the Pequots, had moved into the area during the late 1500s. The Pequots became regionally dominant, taking whatever lands they pleased. The Mohegans was the other major tribe in Connecticut. Among the minor tribes were small bands of Mahicans, Wappingers, and Nipmucks.

Between 1634 and 1636, the Puritan population of Massachusetts expanded into Connecticut, founding settlements at Windsor, Wethersfield, and Hartford. In 1636, John Winthrop Jr. and Lion Gardiner, a military engineer, supervised the construction of Fort Saybrook at the mouth of the Connecticut River adjacent to Long Island Sound. In 1637, Puritans from London founded the town of New Haven as an independent colony.

Encroaching English settlements and a series of murders led inexorably to the outbreak of war with the Pequots in 1636. The war culminated in the May 26, 1637, massacre of the principal Pequot village on the Mystic River. Captain John Mason and Captain John Underhill led a 150-man force of Connecticut and Massachusetts troops and Mohegan and Narragansett warriors in a surprise predawn attack. They set the sleeping village afire, surrounded it, and killed anyone who tried to escape. Probably more than 400 Pequot men, women, and children died in just 30 minutes. The slaughter horrified even age-old native enemies of the Pequots.

The Massachusetts government divided up the Pequots' former Connecticut land among Puritans. With Winthrop presiding, in 1639 the English towns of Connecticut agreed on a governing document, called the Fundamental Orders. Only approved male members of Puritan congregations, called "freemen," had full voting privileges. Quakers, atheists, and Jews were forbidden to take part in elections. A royal charter granted in 1662 by Charles II left the government of Connecticut virtually unchanged.

In September 1650, New Netherland and New England officials conferred at Hartford to establish a border between the two colonies. The resulting agreement gave Connecticut to the English.

Shortly thereafter, word arrived of the outbreak of the Anglo-Dutch War in Europe. The Dutch maintained their post at Fort Good Hope until a New England force ejected them in July 1653.

Sir Edmund Andros, royal governor of New York, later claimed that New York rightfully extended to the Connecticut River. With King Philip's War imminent, Andros seized the opportunity to move two shiploads of soldiers to Fort Saybrook on July 8, 1675. Connecticut's governor, however, had anticipated the expedition and fully manned the fort, forcing Andros to withdraw.

As the English coerced Metacom (King Philip), leader of the Wampanoags, to cede ever more land, he organized a confederacy to resist English expansion. By autumn 1675, the Narragansetts and the Nipmucks had joined the Wampanoags. The Mohegans and the few remaining Pequots allied with the English. The resulting conflict began beyond Connecticut's borders. Connecticut sent about 300 English and 150 Native American warriors up the Connecticut River Valley into western Massachusetts. Connecticut forces participated in the December 1675 attack on the Narragansetts in Rhode Island, the Great Swamp Fight, that cost the two sides more than 1,000 casualties. The war continued through the winter, but by June 1676 New England had triumphed. By the end of King Philip's War, the Mohegans, staunch allies of the English, were the only important tribe still living in Connecticut. Expanding English settlement reduced Mohegan territory and the tribe's population until it numbered barely 200 people by 1775.

Connecticut towns escaped damage during King William's War (1689–1697), but Connecticut contributed more than 100 militiamen and a sum of money to the defense of New York. During Queen Anne's War (1702–1713), Connecticut came to the assistance of Massachusetts in 1704, when Deerfield fell to a French–Native American assault. Connecticut also sent 300 men to participate in the 1710 capture of Port Royal, Nova Scotia. However, with peace restored, Connecticut refused to supply troops to patrol the New England–New France border.

When war with France again appeared likely, Connecticut bought cannon, built a warship, and fortified its frontier. The colony also sent several hundred militiamen to New York and Massachusetts. During King George's War (1744–1748), 500 Connecticut militiamen joined in the 1745 expedition against Louisbourg.

At the outbreak of the French and Indian War (1754–1763), Connecticut sent 1,500 men to build forts on the Hudson River. Over the course of the war, Connecticut sent thousands more troops to the Hudson Valley in response to British calls for assistance. As had been the case in the previous wars, no battles took place on Connecticut soil.

Contractors, British Army

During the early years of the 18th century, procuring food and forage for military forces ceased to be an individualistic enterprise, and complex logistical organizations came into being. Although British Army units were under the control of the War Office and the civilian secretary at war (who held no official cabinet rank), the Treasury was responsible for supplying them.

Supplying British and colonial armies in North America was often a contentious affair. Senior British commanders all complained bitterly about the fact that politics and profits often took precedence over the efficient distribution of food and equipment. For example, during the joint British–New England expedition against Canada in 1711, British supply officials found themselves at odds with Massachusetts merchants. Indeed, a number of British commanders indicted colonial merchants for refusing to grant credit, hoarding, and attempting to drive up the cost of supplies through inflationary schemes. Sometimes colonials fought among themselves over supply contracts, as during 1755–1756 in the French and Indian War (1754–1763), when a major disagreement erupted between Massachusetts governor William Shirley and New York lieutenant governor James DeLancey over supply contractors.

Conditions during the French and Indian War dramatically increased the Treasury's supply tasks. An army campaigning in the remote wilderness with a sparse population had great difficulty securing necessary supplies. Almost everything had to be collected from distant areas and transported. The Treasury thus took up the task of contracting for provisions. Most food came from the colonies, but early in the war, food also came from Britain.

The Treasury conducted contract negotiations with London merchants who often subcontracted with colonial merchants. It was these merchants who actually collected, delivered, and stored necessary items. From company storehouses, contractors' agents issued the supplies to the army quartermasters. The only War Office official involved in this process was the commissary general. His sole function was to ensure that supply contractors fulfilled their contracts in terms of quantity, quality, and time of delivery.

An army's commanding officer often had his work cut out for him in terms of supplies. Contractors often sought to extort inflated sums for goods that would still be months in coming. Provincial contractors often failed to live up to their agreements, and when they did deliver the goods promised, they were often substandard and sometimes worthless. Food supplies contracted by the army were often found to be inedible.

Problems with suppliers and contractors were far from unique to the North American colonial theater. Judging by contemporary correspondence, many commanders seemed to think that their situation with particular contractors was unique. Major General Edward Braddock's 1755 expedition against Fort Duquesne was supplied with beef so rancid that the troops buried it. Supplies were slow in arriving, and Braddock complained that having to draw provisions from distant colonies obliged him to employ a number of assistant commissaries. None of these men would serve without exorbitant pay. Braddock was also forced to let more contracts than he believed necessary in order to guard against the failure of some of them.

When the British government took the decision in 1763 to maintain a sizable permanent military force in America, the Treasury's responsibility remained. It continued to negotiate contracts with London firms until this system collapsed with the outbreak of the American Revolutionary War in 1775, when the British had great difficulty securing supplies in America. Most British Army supplies were then shipped to America from stores at Cork.

Converse, James

Born: November 16, 1645

Died: July 8, 1706

Military and political leader of Maine and Massachusetts at the time of King William's War (1689–1697) and considered one of the few effective military officers of the era. James Converse was born in Woburn, Massachusetts, on November 16, 1645. In the early years of King William's War, he served as a captain in the Massachusetts Militia on the Maine frontier.

Converse was second-in-command to Major Benjamin Church during the latter's raid through Maine in September 1690. Church

left Converse in charge of a detachment in Wells, Maine. There he helped repulse an attack by 200 Norridgewock Abenakis on the "garrison" (palisaded blockhouse home) of Joseph Storer in Wells in June 1691.

In November 1691, a group of Abenaki chiefs met with Converse at the mouth of the Kennebec River. Among them was an especially hostile chief named Moxus. Nevertheless, an uneasy peace agreement was reached. The Abenakis returned at least 10 captives and promised to bring those remaining to Wells by May 1, 1692. The truce, however, was short lived, and in February 1692, the Abenakis raided York, Maine, killing 48 people and taking another 73 captives.

In the summer of 1692, Converse was in command of 15 provincial troops and a comparable number of refugees in Wells. On June 10, 1692, a score of Canadians, led by Lieutenant René Robineau de Portneuf, and 400 Abenakis, led by Moxus, launched another attack on the Storer garrison. Also with them was Jean-Vincent d'Abbadie de Saint-Castin, a French baron, former army officer, and future chief of the Penobscot Abenakis. Converse held out through a 48-hour siege, albeit not a highly determined one. The enemy sought unsuccessfully to taunt Converse into emerging into the open but finally withdrew after butchering cattle, burning the church and some homes, attempting to burn two sloops in the river, and torturing a captured villager to death.

With this strong defensive action, Converse was credited with saving the Maine frontier from collapse. He was subsequently promoted to major and placed in charge of all Massachusetts forces on the northern frontier. In 1693, he ranged across the Maine frontier with 250 newly levied troops (as far north as modern-day Waterville) and also built a stone fort on the west side of Saco Bay. The Native Americans moved farther inland to avoid contact, and Maine was spared from major conflict that year. In 1698 Converse was appointed as one of three commissioners assigned to broker a peace with the eastern Native Americans at Casco Bay. The treaty was signed on January 7, 1699.

In addition to his military duties, Converse also represented Woburn in the Massachusetts assembly (1695–1699, 1701–1705) and eventually served as speaker of the Massachusetts House of Representatives (1699, 1702, 1703). In 1702, during Queen Anne's War (1702–1713), the Massachusetts governor named Converse commander of all field forces. After being elected to the assembly for yet another term in 1706, Converse died suddenly in Woburn, Massachusetts, on July 8, 1706.

Coode's Rebellion

Event Date: July 1689

Protestant uprising in Maryland that began with the news of William of Orange's ascension to the throne of England during the Glorious Revolution. The rebellion resulted in the displacement of Maryland's proprietary family, the Calverts, as the ruling authority in the colony until 1715. The rebellion took its name from John Coode, one of its principal leaders. Coode was born in Cornwall, England, in 1648. After attending Oxford University and becoming an Anglican priest, he migrated to Maryland in 1672, relatively poor. He and his wife, a wealthy resident of St. Mary's County, moved to Charles County, where Coode developed a reputation for political agitation.

The Calverts first perceived Coode and his associate, former governor Josiah Fendall, as threats to their authority in 1681 when they both spoke out against the Calverts' control of the Maryland government. Charles Calvert invoked memories of Bacon's Rebellion (1676–1677) in neighboring Virginia in describing both Coode and Fendall. There was no substantial connection between the Virginia rebellion and the Maryland unrest other than the fact that agitators in both colonies challenged the authority and legitimacy of their respective governments. In fact, during Bacon's Rebellion, the Maryland government ironically appointed Coode to patrol the Potomac River to prevent the spread of violence into Maryland.

Although little came out of the 1681 confrontation between Coode and Fendall and the colonial government, a clear division began emerging in the early 1680s. The Catholic Calverts controlled much of the land in the colony and influenced the government by choosing governors and surrounding them with other Catholics in high office. At the same time, however, a growing number of Protestants in the colony's legislative assembly wanted to diminish the power of the Calverts and Catholics in general.

When word reached Maryland in 1689 that England had a new Protestant monarch, anti-Catholic forces in Charles County began to muster under the command of Coode. They called their organization the Protestant Association and demanded limitations on Catholic office holders and the end of Calvert control. Coode proclaimed that the most pressing concern involved raising a militia to prevent Catholics from inciting rebellion among Native Americans. This baseless fear had often been brought as a charge against the Calvert family in the past.

In late July 1689, Coode and other Association leaders drafted a declaration outlining their grievances against the Maryland government and proclaiming their allegiance to the new king and queen of England. The declaration clearly demonstrated their determination to assert the authority of Protestants in Maryland. By the time they descended on Maryland's capital at St. Mary's City on July 27, 1689, Coode's forces had grown substantially. William Digges, a member of the Calvert family, surrendered the capital when 80 to 100 pro-Calvert defenders refused to offer any resistance.

American writer James Fenimore Cooper (1789–1851), who captured the popular imagination with stories rooted in America's own history that lauded the frontier experience and Native American culture. (National Archives)

Several days later the last force of about 160 pro-Calvert militiamen surrendered to approximately 700 rebels, marking the end of this bloodless seizure of power. The pro-Calvert men were allowed to return home and were ensured of their rights as citizens of Maryland.

The Associators next began the process of establishing a new government. They first solidified their control of the colony by removing from office any remaining Calvert loyalists, including justices, militia officers, and all minor office holders. Their other primary concern involved gaining recognition for their government from the new English monarchy. To secure royal acceptance, the Associators formed their own convention with delegates from all but one of Maryland's counties. In the Associators' Convention, delegates outlined a plan to keep the county-level positions in operation and they formally asked for royal guidance on the government of Maryland.

In early February 1690, royal authorities directed the Associators to maintain their control of the colony. This order came after Lord Calvert offered a compromise plan in late 1689 to appoint only Protestants to government posts in Maryland. Officials in London named Lionel Copley acting governor of Maryland in May 1690. When Copley arrived in 1692, he began a period of royal control over the colony that lasted until 1715, when the Calvert family regained direct authority over the colony after converting to Anglicanism.

Cooper, James Fenimore

Born: September 15, 1789 Died: September 14, 1851

American novelist who treated the colonial experience in many of his novels and glorified Native Americans. The first American to support himself completely by writing novels, Cooper helped to create a unique American literature, capturing the influences of nature and the frontier experience in his stories. Although he believed it was the duty of the United States to expand across the continent, Cooper also decried the destruction of the wilderness and the Native Americans, whom he viewed as noble.

Born on September 15, 1789, in Burlington, New Jersey, Cooper was the son of a land agent and developer. William Cooper moved his family in 1790 to Cooperstown, then a village in upstate New York on the edge of the wilderness. There his son played in the forest and dreamed of earlier days.

Cooper was raised as a Federalist gentleman, to support the Republic and protect it from the vagaries of the mob. Not a good student, he was often in trouble. Cooper studied at Yale during 1803–1805 but was expelled for blowing up another student's door. His father arranged for him to go to sea, preparatory to entering the U.S. Navy. The experience gave Cooper a love of the sea as a place of freedom and adventure. Appointed a midshipman in January 1808, Cooper was assigned to the U.S. Navy warship *Wasp* as a recruiting officer. When his father died in 1809, Cooper inherited \$50,000 and resigned his commission in May 1811. By 1820, Cooper had gone through his inheritance and faced financial ruin. In desperation, he turned to writing as a career.

Cooper's first novels were published anonymously. His first, *Precaution*, about English manners, appeared in 1820 and was a failure. His second, *The Spy* (1821), was a patriotic historical treatment of the American Revolutionary War. It was one of the first novels written by an American with an American setting and characters. *The Spy* was hugely popular. His next novel, *The Pioneers* (1823), was autobiographical and dealt with the founding of Cooperstown. A prevalent theme in the novel was the conflict between taming the wilderness and preserving it. In this novel, Cooper intro-

duced his most memorable character, Natty Bumpo, an aged hunter. He became the symbol of the American frontiersman. The character was based on Daniel Boone and other scouts and explorers. Natty Bumpo appeared in four other Cooper novels, including *The Last of the Mohicans* (1826), Cooper's most famous work. Known as the Leatherstocking Tales, the five novels are *The Pioneers* (1823), *The Last of the Mohicans* (1826), *The Prairie* (1827), *The Pathfinder* (1840), and *The Deerslayer* (1841).

Cooper's works were widely read by both Americans and Europeans. His descriptions of the frontier and its effect on the American character were highly influential. His depiction of American expansion as inevitable and correct conformed with the manifest destiny philosophy accepted by many Americans of his day.

During the 1830s, Cooper's popularity declined. His elitist approach alienated many. Cooper disliked the "tyranny" of popular democracy and favored a republic controlled by the elite. Cooper's later writings were often permeated with polemics against the vulgar crowd. He also became known for his many libel suits against publishers critical of his ideas and writings.

Cooper supported the Mexican-American War (1846–1848), seeing it as part of the mission of the United States to spread liberty around the world. He thought the Mexican people would benefit by fair and honest rule in the U.S. model. He wrote one novel set in the war, *Jack Tier; Or the Florida Reefs* (1848). One of the most important themes of the novel was that of a benevolent U.S. government rescuing Mexico from ambitious and dishonest rulers. Among his 52 books is the first scholarly study of the early U.S. Navy, *History of the Navy of the United States of America* (1839). Cooper's health declined in the spring of 1851, and he died at Cooperstown on September 14, 1851.

Córdova, Francisco Hernández de

Born: Unknown Died: 1518

Spanish explorer and slave trader. There is no known birth date or place for Francisco Hernández de Córdova (also spelled Francisco Fernández de Córdoba), and his early years remain an enigma. Córdova was the first Spaniard to explore Mexico's Yucatan Peninsula

in 1517. On February 8, 1517, Córdova and 110 men left Cuba in three ships bought on credit from the governor of Cuba, Diego Velásquez. Although the initial goal of the expedition was to procure slaves on the small islands off the coast of Honduras, storms drove Córdova off course. His expedition landed on an unknown coastline in March 1517. Córdova inquired of the native peoples (in Spanish) where he was. They replied (in their own language) "Tectetan," which meant "I do not understand you." Henceforth, the Spaniards called the region "Yucatan."

Although a few shipwrecked Spanish sailors had found refuge on the Yucatan Peninsula prior to Córdova's arrival, Córdova was the first European to explore the region. He initially landed on the northeastern end of the peninsula and continued northwest. Almost immediately, he realized that the Native Americans he encountered on the peninsula, the Maya, had a civilization far more advanced than any of the other native civilizations that the Spaniards had encountered in the Caribbean. In his report to Velásquez, Córdova noted that the Maya constructed buildings made of limestone, had sophisticated agricultural techniques, and wore fine cotton clothing and gold jewelry. The Mayan people, however, greeted Córdova's expedition with great hostility. Over the course of their journey, more than half of the expeditionary force was killed, and the remainder of the soldiers, including Córdova, were wounded.

After several months of exploration, Córdova returned to Cuba and presented his report to the governor. He died there in early 1518 of the wounds he had received at the hands of the Maya. Velásquez was absolutely convinced of the importance of Córdova's discovery, however. Indeed, Córdova's expedition opened the door for Juan de Grijalva's expedition to the Yucatan Peninsula in 1518 and, most important, Hernán Cortés's lucrative foray into Mexico in 1519.

Cornstalk

Born: ca. 1720

Died: November 10, 1777

Shawnee leader who lobbied for good relations with English colonists. Cornstalk was born in Pennsylvania around 1720. Like many other warriors who were unhappy with the British crown after 1763, Cornstalk led raids against Virginia's frontier settlements. After Pontiac's defeat at Bushy Run (1763), however, Cornstalk recognized the folly

of armed rebellion. He would spend the rest of his life working to forge a peaceful accommodation with the westward-moving English.

Cornstalk's diplomatic measures were tested in 1774 when Gov. Lord Dunmore of Virginia dispatched soldiers to the Ohio Valley following a series of frontier murders and revenge raids. By October 1774, some 1,100 soldiers had invaded Shawnee territory. Although Cornstalk counseled peace, the Shawnees voted to attack the invaders. Cornstalk subsequently led Shawnee, Mingo, Delaware, Wyandot, and Ottawa warriors against the unsuspecting Virginia camp at Point Pleasant on October 10, 1774. Following a humiliating defeat, Cornstalk led a Shawnee delegation to Camp Charlotte and accepted Lord Dunmore's peace terms.

Cornstalk honored the treaty provisions and encouraged other natives to embrace the strategy of peaceful neutrality during the American Revolutionary War. In 1777 the Shawnee leader visited Fort Randolph to inform the Americans that the Shawnees, including his own band, would ally with the British. Cornstalk, along with Red Hawk, a young Delaware chief, and his son Ellinipisco, were then detained. When a young soldier was killed and scalped while hunting for deer, an angry mob of John Hall's Rockbridge volunteers murdered Cornstalk and his two companions on November 10, 1777.

Cornwallis, Edward

Born: February 22, 1713 Died: January 14, 1776

British Army officer, founder of Halifax, and governor of Nova Scotia (1749–1751) and Gibraltar (1762–1765). Edward Cornwallis, son of Charles, Fourth Baron Cornwallis, and Lady Charlotte Butler, was born in London on February 22, 1713. Following his education at Eton, he secured a commission as ensign in the British Army in 1730.

His prominent family's influence enabled Cornwallis to rise quickly through the ranks, and by 1742 he held the rank of major. The following year he was elected to the House of Commons. In 1744, Cornwallis joined his regiment in Flanders and won promotion to lieutenant colonel, although the regiment was ordered back to Britain to help quell the Jacobite uprising in 1745. Cornwallis

fought at Chester and Culloden, and King George II recognized his service with an appointment as groom of the bedchamber in 1747.

In 1748, Lord Halifax and the Board of Trade decided to strengthen the British hold on Nova Scotia by establishing a settlement on the east coast. Selected to command the expedition, Cornwallis received the appointment as governor of the province, along with a promotion to colonel. He then resigned from Parliament and arrived in Nova Scotia in 1749, the head of more than 2,500 settlers. Cornwallis founded the town of Halifax on Chebucto Bay, which could serve as a base for the Royal Navy.

The situation of the Nova Scotia settlement was precarious, with the potentially hostile Acadians on the western side of the peninsula, and the Micmac natives located in the province's interior. Cornwallis fortified Halifax against attack by land, established a second settlement across the bay, and requested troops to strengthen his position. Although the Acadians remained peaceful, the Micmacs resented the British intrusion and launched a harassing war, killing many settlers who ventured outside the palisades and preventing the British from expanding the settlement. Cornwallis failed to defeat the Micmacs, and the Board of Trade blamed him for the continuing hostilities as well as the heavy expenses involved in maintaining the settlement. In 1751, citing poor health, Cornwallis resigned as governor and returned to England.

Reelected to Parliament in 1752, Cornwallis strengthened his political connections the following year by his marriage to Mary Townshend, daughter of the Second Viscount Townshend. Cornwallis served—without distinction—in the Seven Years' War (1756–1763), but his connections enabled him to rise to lieutenant general and governor of Gibraltar in 1762. However, illness forced him to leave Gibraltar in 1765, and he remained in poor health until his death in England, probably at his home in Essington, Hertfordshire, on January 14, 1776.

Coronado, Francisco Vásquez de

Born: 1510

Died: September 22, 1554

Spanish explorer and provincial governor. Francisco Vázquez de Coronado was born in Salamanca, Spain, in 1510 to noble parentage. In 1535 he moved to Mexico in the company of Viceroy Antonio de Mendoza, seeking fame and fortune. Coronado served in

Illustration depicting Spanish explorer Francisco Vásquez de Coronado during his futile 1540–1542 search for the legendary Seven Cities of Cibola. (Library of Congress)

various political offices and ultimately rose to become the governor of the province of Nueva Galicia in Western Mexico.

The Spaniards had long heard tales of cities of gold located in the northern interior of the continent, and legend had it that the famed "Seven Cities of Cibola" existed in the uncharted wilds of North America. Allegedly, these cities held riches that surpassed even those of the Aztec and Incan Empires. Two "eyewitness" accounts held particular influence over the Spaniards' lust for riches. One account was that of Álvar Núñez Cabez de Vaca, who traveled throughout Texas and told of seeing precious metals in the mountains of northwestern Mexico. However, the most tempting account of riches came from Friar Marcos de Niza, who discovered "seven cities of gold," the smallest being larger and richer than Mexico City.

On hearing these stories, Mendoza appointed Coronado commander of an expedition charged with finding the Seven Cities of Cibola. The expedition left the Culiacan on April 22, 1540, and consisted of 300 Spanish soldiers and a large contingent of Native American allies. The caravan moved north, reaching the Zuni village of Hawikuh, supposedly one of the Seven Cities in present-day Arizona. The Spanish laid siege to the village and captured it on July

7, 1540. However, the settlement was not a city of gold, but rather a small, native community. The other alleged cities turned out to be simple villages as well.

Undeterred, Coronado led his men east on an arduous trek through New Mexico, Texas, Oklahoma, and into Kansas in search of the golden city of Quivera. Coronado found nothing more than a settlement of seminomadic Native Americans. Failure though it was, Coronado's expedition extended Spanish influence into much of today's southwestern United States. Coronado was also the first Spaniard to make contact with many unknown Native American tribes, establishing a pattern of hostility and distrust for centuries to come.

Coronado returned to Mexico City in July 1542, where he faced an inquiry for the mistreatment of natives he encountered. Found guilty several years later, he was removed from office. Coronado died on September 22, 1554, in Mexico City.

Coulon de Villiers, Louis

Born: August 10, 1710 Died: November 2, 1757

French colonial regular army officer. Louis Coulon de Villiers was born on August 10, 1710, at Verchères, Quebec, the son of Nicolas-Antoine Coulon de Villiers and Angélique Jarret de Verchères. He began his military career as a cadet in the French colonial regulars and served in France's western holdings located in present-day Michigan, Wisconsin, and Indiana. In 1753, he returned to Montreal after his service in the hinterlands and in 1754 received command of 600 Canadians and more than 100 Native American warriors to reinforce Fort Duquesne. On his arrival on June 26, he learned that a scouting party led by his brother, Joseph Coulon de Villiers de Jumonville, had been attacked by Virginia provincial troops under the command of Colonel George Washington and their native allies, led by Tanaghrisson (Half-King). Thirteen French soldiers, including Jumonville, were killed, 1 was wounded, and 1 escaped; the remaining soldiers were taken prisoner. Louis Coulon de Villiers then requested the command of the force of 600 French regulars, Canadian militiamen, and 100 native allies that had been mustered to drive the British out of the territory claimed by France.

Villiers encountered Washington's forces at Fort Necessity on July 3, 1754. After dispersing his men among the wooded hillsides surrounding the fort, Villiers ordered the attack at around 11:00 a.m. The French rained bullets down into the English positions; they themselves were largely sheltered from retaliatory fire. It had begun raining heavily early that morning, and the rain caused firing mechanisms to become useless. By midafternoon, few if any English muskets could be fired. By dark, a third of the men in the fort were either dead or wounded.

At 8:00 p.m., Villiers invited the English to negotiate; Washington sent Jacob Van Braam to treat with the French. Villiers offered the English the chance to withdraw from the battlefield. He explained that he was there to avenge the death of his brother and his men, which he had done. Villiers would allow the English to withdraw from the field with their personal possessions, arms, and colors if they agreed to sign articles of capitulation, withdraw from the Ohio Country (and promise not to return for a year), to repatri-

ate the prisoners they had taken, and to leave two officers as hostages at Fort Duquesne as a guarantee of compliance with the terms of surrender.

Van Braam returned to Washington bearing the articles of capitulation. Either he did not understand, or did not say, that the document he carried placed responsibility on Washington for the "assassination" of Jumonville. Neither he, nor anyone else within the confines of the fort, realized the gravity of the articles and the repercussions of Washington's signature.

Villiers and his men returned to Fort Duquesne after destroying Fort Necessity and the remnants of English occupation in the Ohio Country. They were welcomed into Duquesne as heroes. Ange Duquesne de Menneville, Marquis de Duquesne and governorgeneral of Canada, praised Coulon's valor and restraint in sparing the lives of the English.

The following year, 1755, Villiers gained further renown in western Pennsylvania. He also distinguished himself in the capture of Fort Granville and Fort Oswego. Villiers was awarded the Cross of Saint Louis just days before his death from smallpox on November 2, 1757, at Montreal.

Coulon de Villiers de Jumonville, Joseph

Born: September 8, 1718 Died: May 28, 1754

French colonial regular army officer. Joseph Coulon de Villiers de Jumonville was born on September 8, 1718, at Verchères, France, the son of Nicolas-Antoine Coulon de Villiers and Angélique Jarret de Verchères. He was one of six brothers, all officers in the French colonial regular troops. Jumonville became an ensign and had a relatively undistinguished career until May 28, 1754. In 1733, he was first stationed at Baie-des-Puants (present-day Green Bay, Wisconsin) and later served on the Acadian frontier. In 1753, the French began constructing a chain of forts south of Lake Erie to the Ohio River to gain military control of the area. Jumonville was subsequently stationed at Fort Duquesne, constructed to defend the Forks of the Ohio.

In the spring of 1754, Virginia provincial troops under the command of Lieutenant Colonel George Washington and Native American allies under Tanaghrisson (Half-King) were sent to Ohio to survey the situation. The commander of Fort Duquesne, Claude-Pierre Pécaudy de Contrecoeur, was under orders to avoid hostilities with the British but to defend his position if attacked. On May 23, Contrecoeur dispatched Jumonville and a force of 35 men to see if the Virginia troops were on French territory. If this were the case, Jumonville was to notify the fort, then deliver a formal summons to Washington asking him to withdraw. Jumonville considered his small force an embassy sent to gather reliable intelligence.

Washington learned four days later that a small party of French had been scouting his location. His men were encamped at Great Meadows, a marshy clearing tucked neatly in between Laurel Ridge and Chestnut Ridge. Because of its strategic location halfway between Wills Creek and Red Stone Fort, its constantly running stream, and its abundant grasses to feed the expedition's livestock, Washington planned on building a fortification at this site. The Virginians were entrenching and preparing to build a stockade the morning of May 27. Christopher Gist, Washington's guide, informed the colonel that a party of French troops appeared to be proceeding toward Great Meadows.

Washington dispatched 75 men under Captain Peter Hogg to intercept the French but became concerned when he learned that the French were encamped just beyond Laurel Ridge, about seven miles northwest of his position, and in the opposite direction from which he sent Hogg. At dawn on May 28, 1754, Washington's force surrounded the French camp. There are varying accounts of the ensuing battle, though the most accurate appears to be the secondhand account given by a Private John Shaw. Shaw claims that the French fired first and the English returned fire. During a brief pause in the fighting, Jumonville supposedly tried to deliver his message from Contrecoeur but was shot and wounded before he was able to do so. What angered the French most was the murder of Jumonville by Tanaghrisson after he was wounded and the apparent massacre of the remaining French troops after the cease-fire. Thirteen Frenchmen were killed, 1 was wounded, 1 escaped, and the rest were taken prisoner. Jumonville died on May 28, 1754, near present-day Jumonville, Pennsylvania. The shots fired in the small glen in western Pennsylvania proved to be the opening volleys of the French and Indian War (1754-1763).

Council of the Indies

The supreme governing body of Spain's colonies in the Americas during 1524-1834. Established by King Carlos V, the Council of the Indies (Consejo Real y Supremo de las Indias, Royal and Supreme Council of the Indies) functioned as a legislative, judicial, and administrative body. It was responsible for preparing and issuing legislation governing the colonies, approving all activities performed by colonial officials, controlling trade between Spain and the New World, supervising conversions by the Catholic Church of native peoples, directing military affairs in the Indies, and administering justice in the Americas. Normally, there were between 6 to 10 council members, all of whom were appointed by the king. The council was responsible for producing massive amounts of legislation, which were codified in the Laws of the Indies in 1680. A powerful and effective institution that suffered from inflexibility, the council declined in importance during the 18th century with the advent of the Bourbon Reforms.

The Council of the Indies supervised the Casa de la Contrataci (House of Trade), an institution established in 1503 to regulate all commerce between the colonies and Spain. The House of Trade organized the biannual *flotas* (treasure fleets) that sustained the Spanish economy. The council was also the court of last resort for all civil cases appealed from the colonial courts and was in charge of appointing government officials to oversee the colonies.

The viceroy, the most important political position in the New World, was directly accountable to the Council of the Indies. To monitor the viceroys, the council instituted the *residencia* (judicial inquiry), which was performed at the end of a colonial government official's term in office. A judge was sent to the Americas to hear testimony regarding the official's performance. Another method of control was the *visita* (secret investigation), a surprise visit that could occur at any time during an official term.

Although Spain had the most elaborate and well functioning of all the European colonial administrations in the New World, there were weaknesses in the system. The Council of the Indies ruled from a great distance, which invariably caused problems. Notwithstanding elaborate safeguards, it was difficult to guarantee that the officials sent by the council would not be corrupt. In addition, most council members were *peninsulares* (Spaniards born in Spain) who had little firsthand knowledge of the Americas. Regardless, the council was able to preside over a vast territorial empire for three centuries. In fact, it became the administrative model for European colonial offices throughout the 19th century.

Coureurs de Bois

French term, meaning "woods runners." As French traders to Native Americans, coureurs de bois and voyageurs (voyagers) created and cemented an alliance system primarily among Great Lakes and upper Mississippi River Native American tribes for the French government in North America. They also directly and indirectly carried out French imperial policy throughout the colonial period. Voyageurs were traders officially licensed by the French government to trade with Native Americans, and coureurs de bois were the unlicensed brethren of the voyageurs. Both participated in the trade of furs, mostly deer and beaver skins, caught by Native Americans and traded primarily for alcohol, guns, cloth, an assortment of metal utensils, and various trinkets and body paint.

Both *voyageurs* and *coureurs de bois* tended to adopt native culture and many married tribal women with important family connections to strengthen their trading position. Because *coureurs de bois* were not licensed by the government, they usually did not abide by limitations and bans on trading alcohol with Native Americans, and often traded with the colonial rivals of the French in North America, the British and Spanish. As a result of these types of activities, *coureurs de bois* undermined French policy as much as they promoted it, and often created problems with native people and British and Spanish colonists that French officials had to resolve.

However, in times of warfare such as the French and Indian War, *voyageurs* and *coureurs de bois* proved invaluable to the badly outnumbered French in North America. The bulk of the fighting for the French was done by native allies, and most of the time, *voyageurs* and *coureurs de bois* joined with and led these native allies on raids against the British. In wartime, both groups proved invaluable in motivating and organizing French-native attacks on the British colonies in North America.

Covenant Chain

A system of treaties, alliances, and councils between the five nations of the Iroquois Confederation (the Senecas, the Cayugas, the Onondagas, the Oneidas, and the Mohawks) and the English North American colonies. After 1720, the confederation expanded to include six nations with the addition of the Tuscaroras.

The first recorded agreement of the Covenant Chain was that negotiated with New York's Gov. Edmund Andros in 1677. A visible emblem of the chain appeared in 1692, with a treaty recorded on the *Guswenta*, a four-foot-long, two-row wampum belt. One row of it symbolized the Iroquois and the other the settlers, representing an arrangement that was equal as brothers rather than dominant/subordinate as father to son. A three-link silver chain was made to make the metaphor tangible.

In place between the late 17th century and the 1760s, the Covenant Chain dealt with issues of settlement, trade, and the episodic violence between the colonials and the Iroquois Nations. The Iroquois spoke for the tribes they had subordinated in battle, creating a greater illusion of unity in Native American councils than actually existed, given that the Iroquois government included not only the 50 hereditary chiefs but also a multitude of village leaders. The treaties that comprised the chain were renewed regularly. Generally, the renewals entailed the "polishing" of the wampum belt's silver chain, and the provisioning of aid to the Iroquois Confederation.

Because most of the negotiations occurred in New York's Mohawk Valley, that colony served as the principal colonial negotiator. Over time, Massachusetts, Connecticut, Rhode Island, and Maryland joined the chain as well. In 1720, the Tuscaroras, scattered from their home in North Carolina after the Tuscarora War (1711–1713), also joined the Covenant Chain.

In June 1753, the Mohawks announced that colonial seizure of Iroquois lands had broken the chain. In July 1754, leaders from seven colonies met with Iroquois leaders at Albany to restore the chain, now fearful of French efforts to expand into the Ohio Valley. The meeting dealt principally with English-native land disputes and the growing tensions with France. The Albany Conference also introduced the Iroquois condolence ceremony, which remained part of the native negotiating process for years to come. The Iroquois Confederation remained neutral during the early years of the French and Indian War (1754–1763).

In 1760, the Seven Nations (or Seven Fires) of Canada decided to abandon the French side in the war. They promptly joined the Covenant Chain after a meeting with British major general Jeffery Amherst and Indian Superintendent Sir William Johnson. In the fall of 1768, a meeting at New York's Fort Stanwix polished the tarnished chain and set the boundaries for hunting grounds as promised in the Royal Proclamation of 1763. During the American Revolutionary War, four of the six Iroquois Nations fought alongside the British. Clearly, however, after 1763 the tenor of the Covenant Chain had changed. The withdrawal of the French from North America had more to do with this than any other single development.

Craven, Charles

Born: 1682

Died: December 26, 1754

Proprietary governor of South Carolina (1712–1716). Born in London in 1682 to a family with Royalist sympathies, Charles Craven was the brother of Lord William Craven, one of the Lords Proprietors of Carolina. After attending Trinity College, Oxford, in 1708 Charles was sent to Carolina by his brother to act as secretary of the colony. In 1712, he was selected as governor of South Carolina.

In his new position Craven immediately addressed the need to improve South Carolina's defenses. Many of the Native Americans in the region were known to be restive and in communication with the Spanish in Florida. Craven worked to improve relations with the local Native Americans and sought to aid English traders in preempting the French in trading with the Native Americans. Through his tenure as governor, Craven generally enjoyed harmonious relations with the South Carolina representative assembly.

Although Craven achieved much as governor, he is chiefly remembered for his actions during what became known as the Yamasee War (1715–1717). Craven sent a party headed by Indian Agent Thomas Nairne to treat with the Yamasees in an effort to right past wrongs and establish harmonious relations, but on its approach, the Yamasees attacked the party and killed all but one

member of it. With the beginning of the Yamasee War in a series of coordinated Native American attacks on April 15, 1715, Craven took quick and decisive action. He proclaimed martial law and called up the militia, dispatching them to strong points within the colony. To keep frightened settlers from abandoning the colony, Craven forbade departures. Craven also appealed to the leaders of the other colonies for assistance. Only Massachusetts responded positively, sending some arms but no troops.

The Yamasee War was one of the most destructive of Native American–colonial conflicts, and the native threat was sufficiently severe for Craven to order the arming of a number of slaves to assist in the defense of the colony. Craven personally led a force of some 250 men against Yamasee Town, but the expeditionary force was caught by surprise in a Native American attack along the Combahee River some 16 miles from Yamasee Town. Craven rallied his men, and the colonist beat back the attack, killing a number of Native Americans while losing only a single one of their own.

Craven also successfully treated with the Cherokees, keeping them neutral. Had the Cherokees joined the Yamasees in the fighting, a colonial defeat would have been certain. As it was, Craven only narrowly averted defeat. By early 1716, South Carolina was secure and the Yamasees had fled to Florida.

Much of South Carolina had been devastated in the fighting and with the conclusion of the war, Craven concentrated on rebuilding the colony. He also took measures to put an end to the trading abuses that had brought on the hostilities, creating a trading monopoly to oversee the Indian trade under the supervision of the South Carolina government.

Among Craven's other accomplishments as governor of South Carolina were ordering soundings of the Port Royal River in order to improve navigation, and establishment of the town of Beaufort. In 1716, Craven traveled to London to lobby to have South Carolina made a royal colony to better provide for its future defense. In 1719, he was among the three proprietors who still owned an interest in the colony. Craven's involvement with South Carolina affairs ended with an uprising in Charles Town (present-day Charleston) in 1719. When word was received at that place of the approach of a Spanish Fleet, the citizens mounted a bloodless revolt against the proprietary government and insisted that the Crown assume control. London considered South Carolina too important strategically, and so the government bought out the proprietors and appointed an interim governor. Craven remained in London. He died in Berkshire on December 26, 1754.

Creek-Cherokee Wars

Start Date: 1716 End Date: April 1754

The Creek Nation and the Cherokee Nation fought several wars in the Southeast. These conflicts sprang from disputes over hunting grounds, from frustrations over Carolina English settlers' designs on their lands, and from alliances forged with other native tribes. The fighting occurred in two phases: one from 1716 to 1727 and the other from 1740 to 1754. The Creeks and Cherokees were two of the most populous Native American nations in the Southeast and any conflict involving them was bound to affect English settlers in the Carolinas and Georgia.

Hostilities between the Creeks and Cherokees began in 1716 during the Yamasee War. The fighting started when the Cherokees assassinated Creek diplomats sent to the Lower Cherokee towns to secure support for an assault on English Carolina. During the war, Cherokee warriors, assisted by Carolina settlers, repeatedly raided Abeika (Upper Creek) towns. The settlers, made aware of the precariousness of their southern frontier during the Yamasee War, aided the Cherokees in the expectation that internative warfare would weaken both nations and prevent them from attacking English settlements. The situation was further complicated by warfare between the Creeks and the pro-French Choctaws.

Attempts of officials in Charles Town (present-day Charleston, South Carolina) to influence the Creek-Cherokee War to English advantage were not successful. As the fighting on the frontier escalated, Carolinians increasingly feared for their safety. In 1725, the English sent Tobias Fitch as agent to the Creeks with the mission of securing an end to the war. Despite this and other English efforts, the Creeks and Cherokees continued fighting.

In March 1726, several hundred Cherokee and Chickasaw warriors moved against the Creeks. Operating under the British flag in the false belief that they enjoyed the support of the Crown, the warriors destroyed most of the Creek village of Cussita. The attack terrified many of the English settlers, who feared that it would bring closer ties between the Spanish and the Creeks. After a small force of about 40 Creek warriors attacked and defeated some 500 Cherokee and Chickasaw warriors, officials in Charles Town renewed their push for peace. By January 1727, these officials had negotiated an end to the fighting.

Fighting between the Creeks and Cherokees resumed in 1740, shortly after onset of the War of Jenkins' Ear between Britain and Spain in 1739. The Creeks remained largely neutral during the fighting in America, whereas many Cherokees allied themselves with the British. Hostilities began when the Creeks attacked a Cherokee war

party that had entered Creek country. The Cherokee warriors, who were on their way to attack the Choctaws and their French allies, believed that an ongoing war between the Creeks and Choctaws would allow them to march safely through the Creek territory. In this they miscalculated.

Fighting between the Creeks and the Cherokees continued for several years, until 1744 and the onset of war between Britain and France (King George's War, 1744-1748). British officials then sought to secure Indian allies and end the Creek-Cherokee dispute. In 1745, despite a recently negotiated truce with the Creeks, the Cherokees allowed the Senecas and the Iroquois to use their territory as a staging ground for attacks on the Creeks. When Cherokee warriors joined the fighting, Creek-Cherokee hostilities resumed. In late 1748, Gov. James Glen of South Carolina tried to arrange another truce. The French, correctly assuming that peace between the two Native American nations would benefit the English, sought to disrupt the peace talks by arranging for Creek headman Acorn Whistler to lead an attack on the Cherokees. Despite this action, the Creeks and Cherokees came to an agreement. They settled on boundaries for their hunting grounds, and the Cherokees agreed to stop allowing northern natives passage through their lands to attack the Creeks. Glen agreed to guarantee the agreement, promising to punish transgressors.

The treaty did not hold. Although the Upper Creeks and Cherokees refrained from warfare, in 1750 several Lower Creek towns waged war on their Cherokee neighbors. This fighting was prompted primarily by frustrations caused by what the Lower Creeks saw as the Cherokee control of valuable hunting grounds and continued Cherokee assistance to the northern Indian attacks on the Creeks.

Malatchi, Creek headman of the important Coweta village, led a campaign that sought to conquer hunting grounds from the Cherokee. In April 1750, Malatchi and 500 Lower Creek warriors attacked and razed the Lower Cherokee towns of Echoi and Estatoe. The Creeks continued on the offensive, and when South Carolina restricted trade with the Cherokees for a series of frontier depredations in 1751, the Creeks escalated their campaign to acquire Cherokee lands. This effort was largely successful as all but three of the Lower Cherokee towns were destroyed and many Cherokees were made refugees. As a result of the fighting, the Creeks secured much of the disputed hunting ground between the Little River and Broad River north of present-day Savannah, Georgia.

In 1752, Acorn Whistler and other Creeks assassinated Chero-kee diplomats while they were in Charles Town. Governor Glen demanded justice, and under great pressure from English officials the Creeks finally executed Acorn Whistler. In May 1753, Creek officials traveled to Charles Town to negotiate another peace treaty with the Cherokees. Small skirmishes plagued the region for the following year, but in April 1754 at Coweta, the Creeks and Cherokees negotiated a formal end to the war and brought a lasting peace settlement.

Native American Conflicts Supported by European Intrigue

Creek-Choctaw Wars

Start Date: 1702

End Date: October 1776

Series of pitched conflicts and low-level warfare between the Creek Nation and the Choctaw Nation. Warfare constantly plagued relations between the Creeks and the Choctaws during the colonial period. Although not always technically defined as wars, slave raids and disputes over hunting grounds periodically caused military conflicts between the two southeastern communities. According to some anthropologists, these disputes predated the region's settlement by the Spanish and British. However, they became more pronounced and frequent in the colonial period.

The Creeks and the Choctaws both emerged as distinct communities during the late 17th century, as disease and warfare destroyed the pre-Columbian chiefdoms in the American Southeast. Both nations spoke variants of the Muskogee language, employed similar horticultural practices, used comparable gender norms, and had similar cosmologies. These similarities did not, however, prevent the tensions that were fostered by their proximity to one another. The Creeks primarily lived along the rivers in what became Georgia, Florida, and Alabama. The Choctaws lived to the west in what became Louisiana, Alabama, and Mississippi.

At the start of the 18th century, the Creeks initiated the first Creek-Choctaw War. Encouraged by English officials and armed with English guns, bands of Creek warriors repeatedly marched on several Choctaw towns in an attempt to capture slaves. These slaves were valuable commodities in South Carolina, and this lure would shape the behavior of the Creeks for more than a decade. The British alliance with the Creeks, who obtained a reputation for their martial prowess, led the Spanish and French to forge their own alliances with various southeastern tribes. The Choctaws found allies in traders and officials from French Louisiana.

Soon the fighting between the Creeks and the Choctaws became immersed in the Franco-British rivalry. In the early years, the Creeks were the aggressors in most of the campaigns. This was especially true during Queen Anne's War (1702–1713), when approximately 1,000 Creek warriors attacked the Choctaws and their French allies in 1711. The Creeks launched similar, albeit smaller, slaving campaigns in the following years.

After demand for Native American slaves declined in South Carolina after the Yamasee War (1715–1717), warfare between the Creeks and the Choctaws remained constant along the southern interior. Although tensions did not explode into large-scale warfare, disputes over trade and hunting parties caused ongoing troubles between the nations. Repeated efforts by British officials to resolve the territorial disputes failed. In the most notable attempt, in 1759 Edmund Atkin traveled to the Creek village of Tuckebatchee to delineate the boundary between the nations. The Creeks denied the existence of a boundary between their nation and the fighting over hunting grounds continued.

Following the French and Indian War (1754–1763), the nature of Creek-Choctaw warfare changed once again. With France's withdrawal from the American Southeast, Great Britain became the major player in the region. With the hope of creating a profitable and peaceful new order, Great Britain organized a regional congress in 1763 to be held at Augusta, Georgia. When the Choctaws indicated their desire to participate, some Creek warriors threatened to kill any Choctaws who traveled through the Creek country in order to attend. The Creeks, fearful that their long-term enemy would obtain guns and other supplies from the British, had hoped that France's demise would lead to the deterioration of the Choctaws' position.

Most Choctaws heeded the warning, but Red Shoe, a lesser-known chief, traveled through Chickasaw territory in order to avoid the Creeks and still reach Augusta. After he met with the British, he traveled by boat to Mobile in West Florida. The Creeks, outraged at the emerging diplomatic and economic relationship between the Choctaws and the British, tried to prevent the alliance from being sealed. In 1763, they attacked the Choctaws and reinitiated the Creek-Choctaw War. The Creeks had hoped to force the British into choosing sides rather than making peace with both nations. Rather than siding with their longtime Creek allies, as many Creek headmen anticipated, the British chose to supply both the Creeks and the Choctaws. With ample and uninterrupted supplies, the Creek-Choctaw War became a bloody campaign that preoccupied the warriors of both nations. The desire by British officials to keep the two nations as allies and to focus Creek atten-

tion on the Choctaws rather than the expanding colony in Georgia led to the continuation of this policy until 1776. During this time, several leading headmen were killed, the harvest of deerskins fell precipitously, the debts of Creek hunters skyrocketed, and few diplomatic solutions were found.

The Creek-Choctaw War finally came to a close in 1776, as the ensuing American Revolutionary War led the British to demand a peace rather than continue fueling the dispute. That October, British Indian superintendent John Stuart met with headmen from both nations in Pensacola and negotiated an end to the war.

Creeks

Multi-ethnic Native American group, also known as the Muskogees, who in the colonial period lived in the southeastern portion of North America in what is now Florida, Georgia, and Alabama. The Creeks' location between British Georgia and South Carolina, French Louisiana, and Spanish Florida allowed them to play the colonial powers off one another and protect their diplomatic concerns throughout the colonial period. The Creeks tended to pursue a policy of neutrality when it came to the wars that consumed their

European neighbors. They also vigorously protected their interests against their Choctaw and Cherokee neighbors.

Organized in the 17th century, after the disease-induced collapse of the southeastern chiefdoms that once dominated the region, the Creeks obtained their name from the English who noted that their villages were always built near inland waters. The Spanish similarly called them "Tallapoosa Indians," after one of the rivers along which they primarily lived. At its height, the Creek Confederacy included approximately 60 villages. Comprised of a diversity of ethnic and linguistic groups, the Creeks remained decentralized throughout the colonial period. Nevertheless, Muskogee became the dominant language of the confederacy. A series of ceremonies like the Green Corn Ceremony and a system of matrilineal clans unified them as a people. The Creeks were an agricultural society, with women farming corn, beans, and squash. Men hunted in order to augment their diet and provide skins for the marketplace.

An amorphous polity known as the Creek Confederacy slowly emerged, but at best the Creeks were an alliance of loosely affiliated villages. Rather than a centralized nation, Creeks primarily associated themselves with their village. During the colonial period, they typically referred to themselves as Cowetas, Abihkas, Hichitees, and Alabamas rather than as Creeks. Unbeknownst to colonial officials, many of the most prominent leaders represented only a minority interest or a single village. For example, Tomochichi, one of Georgia governor James Oglethorpe's closest allies, represented the Yamacraws, one of several conquered groups among the Creeks. The Creek spokesperson Brims, frequently called "Emperor Brims," was similarly misunderstood. Rather than a national leader in the early 17th century, Brims was simply the *mico* (head chief) of Coweta, one of the most powerful Creek villages.

Power in Creek society was primary organized around villages and matrilineal clans, and authority was extended to individuals who could convince rather than coerce others into agreement. As a result, Creek power was extremely localized and fluid, and Creek villages were largely autonomous entities. The confederacy served as an organizing principle for trade and war. It did not act as a centralized nation. Marriages, trade, and clan ties connected the villages, but individual villages were free to choose who to ally themselves with or make war against. As a result, Creek villages often divided against one another during the colonial wars. In addition, most villages often tried to remain neutral in the colonial wars, even as neighboring Creek villages went to war.

The emergence of the deerskin trade and the presence of Spanish and British neighbors shaped the diplomatic history of the Creeks. Connections and resistance to slave raiders also helped define the position of the Creeks in the region. During the Yamasee War (1715–1717), the Creeks primarily allied themselves with the French in order to counter trade abuses by the English. The Cherokees took this opportunity to secure an alliance with the British. As a result, a devastating war between the Creeks and Cherokees ensued (ca. 1716–1754).

After the Yamasee War, many Creek leaders decided that neutrality was the best policy. Most towns created trading alliances with

the English. They allowed traders to reside in their village and often marry the daughters of influential leaders. At the same time, Upper Creek villages in the west encouraged the French to build Fort Toulouse (Alabama) to bring supplies and trade goods into the region. Similarly, several Creek villages negotiated alliances with the Spanish in Florida. Despite the hopes of many European diplomats, trade connections and pledges of peace did not necessarily lead to allies during wartime. Although some Creek warriors accompanied Governor Oglethorpe in his invasion of Florida in 1743, most Creeks refrained from participating. During King George's War (1744–1748), most Creek villages remained on the sidelines even as some villages felt pulled by the British or French relationships.

Creek neutrality in terms of their European neighbors did not result in a colonial peace, however. Instead, the Creeks fought several wars with their Cherokee and Choctaw neighbors in the colonial period. The Creeks fought two wars with the Cherokees. The first took place during the Yamasee War. The other occurred in the 1740s and early 1750s. These wars resulted from conflicts over hunting grounds and as attempts to conquer each others' territory. The Creeks also fought a series of bloody wars with the Choctaws (ca. 1702–1776). The conflicts began as reciprocal slave raids and as extensions of the French-English rivalry in the region. These slave raids were often encouraged by European neighbors. In 1711, for example, the English armed more than 1,000 Creek warriors as they marched on their French-Choctaw enemy. Hostilities between the Creeks and Choctaws were the most severe after the French and Indian War (1754–1763). When the British called for a congress at Augusta to establish the postwar order, the Creeks sought to exclude their longtime Choctaw enemies. The English provided guns and ammunition to both sides in the ensuing war, and the Creeks and Choctaws remained at arms until the American Revolutionary War. Thereafter, the Creeks had to contend with the new state of Georgia, which had little regard for former treaties or Creek land rights.

Cresap, Michael

Born: June 29, 1742 Died: October 17, 1775

Frontiersman and land speculator in the upper Ohio River Valley. Born in Allegheny County, Maryland, on June 29, 1742, Michael Cresap became an important figure on the frontier in the region of the upper Ohio River Valley. He is often accused of initiating the hostilities referred to as Lord Dunmore's War, to the extent that the conflict is often referred to synonymously as "Cresap's War."

At first, Cresap attempted to make a living as a shopkeeper. Failing in this endeavor, he set out for the frontier, eventually settling near present-day Wheeling, West Virginia. In 1774, Cresap began speculating and working to promote settlement of lands in the upper Ohio region, and it is here that he earned his place in history.

The controversy involves a pair of incidents in which Cresap allegedly shot and killed several Native Americans, members of Mingo chief Logan's family. Logan blamed the attack, later known as the Yellow Creek Massacre, on Cresap and his men, though indeed they did not commit the act.

Although Cresap participated in attacks on Native Americans on April 27 and 28, 1774, neither of these actions involved Logan or his people. By the same token, the death of Logan's family and his attempts at revenge led Gov. Lord Dunmore of Virginia to initiate hostilities with the Mingos. Cresap served with Daniel Morgan during the resulting campaign.

In 1775, in response to a call for duty by the Continental Congress, Cresap raised a company of riflemen from the Ohio Valley and began leading them to Boston. He died en route in New York City on October 17, 1775.

Croghan, George

Born: ca. 1720

Died: August 31, 1782

Trader, land speculator, and diplomat. Born around 1720 in Dublin, Ireland, George Croghan received what is believed to have been only a rudimentary education. In 1741, he immigrated to Pennsylvania. Once there, he embarked on a career that included roles as a frontier diplomat, Native American trader, and speculator.

When he first arrived in North America, Croghan traded with natives in an area ranging from Western Pennsylvania as far west as the Ohio River Valley. However, this trade was cut short by the outbreak of the French and Indian War (1754–1763). During the conflict, Croghan served as a local militia commander and helped survey the route for what became the path of Major General Edward Braddock's campaign to reach the Monongahela River. According to one biographer, Croghan even assisted in carrying the wounded general from the field during the 1755 battle.

After 1754, Croghan turned from his business interests as a trader to become a full-time diplomat. In 1756, he began a term of service under Sir William Johnson as deputy superintendent for Indian Affairs for the Northern District. He continued in this post until 1772. During his tenure, Croghan took part in several notable conferences, including the Easton Conference of 1758 and the Fort Stanwix Conference. Likewise, he helped put an end to Pontiac's Rebellion (1763) by convincing a number of the western tribes to convene at a conference at Detroit.

Throughout his life in the colonies, Croghan also speculated in land in the frontier territories. By 1773, he had accumulated vast tracts in both western Pennsylvania and western New York. After this point, however, he was forced to sell off much of this property in order to meet various obligations. His contemporaries often viewed Croghan with distrust in financial matters, and this hurt him when it came to redeeming the expenses of his various diplomatic efforts, since these always included gift giving. Croghan died on August 31, 1782, in Passyunk, Pennsylvania, now a part of the city of Philadelphia.

Crown Point (New York)

Strategic site on the southwestern end of Lake Champlain, situated approximately 90 miles north of Albany, New York. Although only about three miles long and a mile wide, New York's Crown Point Peninsula dominated travel from Lake Champlain's southern narrows into the lake's broader northern section. Two forts—Frenchbuilt Fort St. Frédéric erected in the 1730s and, after 1759, Britain's Fort Crown Point—controlled this vital transportation route.

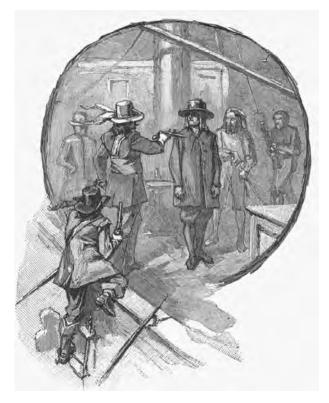

During the French and Indian War (1754–1763), British and provincial forces repeatedly attacked the French in the Champlain Valley. After stalling an English invasion at the September 1755 Battle of Lake George, the French strengthened their hold on Lake Champlain by constructing Fort Carillon (Ticonderoga). It was located 10 miles south of Crown Point at the junction of Lake George and Lake Champlain. Though Fort Carillon repulsed a British attack in 1758, the small garrison could not resist Major General Jeffery Amherst's methodical advance in July 1759. Brigadier General François-Charles de Bourlamaque chose to destroy both Fort Carillon and Fort St. Frédéric before retreating northward. Amherst paused, rebuilding Fort Carillon as Fort Ticonderoga and beginning construction of one of the largest North American forts at Crown Point. The new fort could support future operations, deter French and Native American frontier raids, and possibly serve as a bargaining chip during subsequent peace negotiations. Nearly 2,000 troops labored on the ambitious project through the fall of 1759.

Fort Amherst, soon renamed Fort Crown Point, occupied a bluff overlooking Fort St. Frédéric's ruins. Constructed of log crib earthworks nearly 30 feet high, the pentagonal fort enclosed a seven-acre

parade ground. Capable of supporting a 4,000-man garrison, the fort and its outworks mounted more than 100 guns. Amherst's men built three of four planned 10-gun redoubts a few hundred yards south and east of the fort. Three wooden blockhouses straddled the peninsula's base farther to the south.

In 1760, Crown Point served as a forward base for Brigadier General William Haviland's successful drive against Montreal. With the 1763 Treaty of Paris, Britain retained Canada, making Crown Point's future unclear. After 1760, the British garrison steadily decreased from eight understrength companies to half that number by 1764. To further cut costs and counter Stamp Act agitations, the British shifted additional forces from the Champlain Valley to New York City and Albany in 1765. That left fewer than 100 men to garrison both Crown Point and Ticonderoga.

In April 1773, disaster struck Crown Point when a chimney fire ignited wooden shingles. The blaze quickly spread from the barracks to storage buildings and, ultimately, the fort's wooden wall supports. Rather than rebuild, the garrison shifted to Fort Ticonderoga, leaving a small detachment in one of the outer redoubts. On May 11, 1775, fresh from the capture of Ticonderoga, a group of Vermont's Green Mountain Boys under Seth Warner overwhelmed Crown Point's 11 caretakers. The rebels salvaged military stores and more than 60 cannon from the ruins. Instead of defending British imperial interests, the fort thus ultimately aided the American Revolutionary War.

Culpeper's Rebellion

Start Date: July 1677 End Date: November 1680

Bloodless popular uprising in the Albemarle Sound area of northeastern Carolina by colonists opposed to abusive proprietary rule, enforcement of the Navigation Acts, and increased taxation. During the three-year-long revolt, the provincial governor, customs collector, and several other colonial officials were for a time imprisoned. The leader of the rebellion was John Culpeper, who became chief executive of the region and summoned a popularly elected assembly that operated for two years, along with a court system. English authorities eventually regained control of the colony and tried Culpeper for treason, although he was never punished for his role in the affair.

The primary cause of the long-simmering discontent in the Albemarle settlement was enforcement of the Navigation Acts, which had previously been neglected in the economically struggling colony. These acts, dictated by London, prevented the colonists from importing goods not shipped directly from England and forbade intercolonial trade. They also stipulated that American goods be sold only to England. Furthermore, the 1673 Plantation Duty Act had imposed a penny-per-pound tax on tobacco shipped from one colony to another. This measure struck directly at northern Carolina's most profitable cash crop, which was already beginning to decline in profitability.

Thomas Miller, an Albemarle landowner and newly appointed colonial secretary, illegally took power as chief executive of the region in July 1677 in the absence of Gov. Thomas Eastchurch, who dallied in the West Indies rather than assume his post at Albemarle.

Miller's high-handed conduct and rigid collection of duties led to his imprisonment by angry residents under the direction of John Culpeper and George Durant, who also illegally took over the government. Culpeper had arrived in Albemarle Sound in 1675 from the Charles Town (present-day Charleston, South Carolina) settlement with a reputation for political agitation.

The Albemarle rebels jailed Miller and customs collector Timothy Biggs and outlined their grievances in a document known as "The Remonstrance of the Inhabitants of Pasquotank [County]." They then circulated this document among the various precincts in the region, where several tax officials were also seized. Miller was kept prisoner for two years but managed to escape and return to England. Culpeper and Durant eventually decided to negotiate an amicable settlement with the Albemarle proprietors and returned to England in 1680 to present their version of events. Proprietary officials in England, fearing a royal takeover of their colony if the Crown perceived it to be in disorder, opted not to seek punishment against Culpeper and other leaders of the rebellion. In fact, they defended Culpeper at his trial in November 1680, in which he was acquitted. Meanwhile, in July 1679 a commission arrived from England to restore proprietary government, which brought at least limited stability and order to the Albemarle region.

Cuming, Alexander

Born: December 18, 1691

Died: 1775

Scottish nobleman who traveled in the spring of 1730 to Cherokee country and concluded a trade and military alliance between the British and the Cherokees that lasted for almost three decades. Alexander Cuming was born in Edinburgh, Scotland, on December 18, 1691. At age 12, Queen Anne granted him a commission as a captain in the Earl of Mar Regiment. In 1713, Cuming received a doctor of law degree from the University of Aberdeen. He led a company against the Jacobites during the uprising of 1715, the revolt in Scotland known as "The Fifteen" (for 1715), and afterward he practiced law. From 1719, Cuming was in the employ of the Duke of Argyll.

In 1725 on the death of his father, Cuming became Baronet of Culter. Two years later he was a candidate for a position in the Shire of Aberdeen but did not win the election. Perhaps believing that he should seek another locale in which he might excel, Cuming in Sep-

D

De Brahm, William Gerard

Born: 1718 Died: 1799

German-born cartographer, military engineer in South Carolina and Georgia, and British surveyor general for the Southern District of North America, 1764–1775. William De Brahm was born in Koblenz, Germany, in 1718, and as a young man earned a captain engineer's commission in the army of Holy Roman Emperor Charles VII. De Brahm's conversion to Protestantism forced him to resign his commission in 1748 and eventually led him to emigrate to Georgia in 1751.

De Brahm's background in surveying and fortifications made him useful to the governments of the two southernmost colonies. He became surveyor general of Georgia in 1754 and of South Carolina in August 1755. His 1757 "Map of South Carolina and Part of Georgia" was the first map of southeastern North America based entirely on scientific survey rather than conjecture and verbal reports.

De Brahm likewise assisted in strengthening fortifications in the two colonies during the mid-1750s, as tensions between Britain and France mounted prior to the French and Indian War (1754–1763). His first major project was rebuilding the defenses of Charles Town (present-day Charleston, South Carolina) in 1755, based on a plan he had submitted in 1752. In 1756, De Brahm journeyed to eastern Tennessee to oversee the construction of Fort Loudoun, and a year later he submitted a comprehensive plan for the defenses of Georgia. In each of these cases, De Brahm's elaborate plans required major modifications to suit colonial budgets and, as with the ill-fated Fort Loudoun, proved to be of limited effectiveness.

In the end, De Brahm was recognized most for his cartographic skills. In November 1764, the British government in London

appointed him surveyor general for the Southern District of North America. With the British having won undisputed claim to the southeast in 1763, the government dispatched De Brahm to East Florida to conduct an extensive survey of the peninsula's poorly charted coast. De Brahm spent seven years there, ending his surveys in 1771, when a political dispute with Gov. James Grant of East Florida forced him to travel to London to defend his appointment. Though he would return to America in 1775 to resume his duties, the American Revolutionary War prevented him from ever again acting as surveyor general for the Southern District. De Brahm retired to Philadelphia in the 1790s, where he changed careers and wrote a series of mystical religious and prophetic works. He died in Philadelphia in 1799.

Decanisora

Born: Unknown Died: ca. 1720s

Onondaga diplomat and orator. Decanisora, known as Teganissorens to the French, represented the Iroquois Confederation in

negotiations with New France and New York in the late 17th and early 18th centuries. His precise birth and death dates are unknown. In a time of declining Iroquois strength, he used diplomacy to divide New France from its allies and to balance the French and English against each other. The first recorded mention of Decanisora was in 1682. In that year, he offered assurances of peace to the French in Montreal, hoping to immobilize them, while Iroquois war parties attacked the Illinois and the Miamis, French allies in the west.

By 1693, the Iroquois had suffered heavy losses in the Beaver Wars (1641–1701), as well as in King William's War (1689–1697). Thus they began sounding out the French for peace. In 1694, Decanisora approached the English and voiced frustration with English efforts to prevent negotiations with the French when the English were unable to prevent French attacks, much less oust the French from Canada as promised. He informed them that the Iroquois would be compelled to seek unilateral peace unless additional military supplies were forthcoming. The English immediately complied. Now in a stronger position, Decanisora insisted to the French that peace talks must include the English and that the negotiations must be held in Albany (knowing that neither the French nor the English were prepared to negotiate with each other). Meanwhile, other Iroquois delegations informed the western tribes that the French were abandoning them and negotiating a separate peace with the Iroquois, which soon resulted in a separate peace between the Iroquois and the western tribes.

War between the Iroquois and the French soon resumed, but now the Iroquois were better supplied and the French were shorn of allies. It is not clear, however, to what extent this outcome was planned and to what extent it was the result of ongoing politics between pro-English and pro-French factions in the Iroquois Council.

In 1697, the French and English concluded the peace. This transformed the geopolitical situation for the Iroquois, but the New York authorities apparently neglected to inform them of such. The Iroquois learned of the treaty from the governor of New France late in 1699. Decanisora expressed particular irritation because the English continued to press the Iroquois to fight. At the same time the Iroquois were once again under attack from French-allied tribes to the west. Rumors spread among the Iroquois that the two European powers were conspiring to attack them.

At this point, the Iroquois shifted to a true neutralist position while still attempting to balance the French and English against one other. In 1701, Decanisora led a delegation that agreed to a peace treaty with New France and, at French insistence, with its Native American allies. One provision in the treaty called on the Iroquois to remain neutral during any Anglo-French conflict. The Iroquois also renewed their alliance, the so called Covenant Chain, with the English, but they held the English at arm's length, denying them permission to build a fort on Onondaga territory for another quarter-century. They maintained their neutrality in Anglo-French wars for the next half-century.

Decanisora was courted by both English and French governors, who recognized him as being highly influential within the Iroquois Confederation. In 1721, the Onondaga Council replaced him as

chief orator, possibly because of memory loss. His wife, a Christian Mohawk accused of witchcraft, was murdered in 1700 by an Onondaga, possibly a member of a rival faction.

Deerfield (Massachusetts)

Colonial settlement in western Massachusetts, along the Deerfield River, just west of the Connecticut River. Deerfield was built in a valley between the Hoosac Range to the west and the Pocumtuck Ridge to the east. The neighboring settlement of Northfield lay several miles to the north, near the present-day Vermont and New Hampshire border. Other nearby settlements to the south of Deerfield included Hadley (east of the Connecticut River), Hatfield, and Northampton (west of the Connecticut River).

The area was inhabited by the Pocumtuck tribe, which numbered several hundred people by 1600. Warfare among various regional tribes caused the Pocumtucks to disperse from the area, and in 1667, Captain John C. Pynchon of Springfield (an established settlement farther south along the Connecticut River) was able to purchase land at Pocumtuck. However, the men for whom Pynchon purchased the land quickly sold it. It was subdivided into 43 lots and laid out along a main village street that was a mile in length. Settlement began by 1671. The hamlet was highly vulnerable to attack, as there was little in the way of physical protection for the village.

In 1675, King Philip's War began between the English and the Wampanoags in eastern Massachusetts. By summer's end of that year, the conflict had spread west and was threatening Deerfield and other Connecticut River Valley settlements. In September, marauding Native Americans killed one settler there, and in another incident attacked Deerfield residents as they were going to church services. No one was killed in the latter attack, but it was not long before a second, major attack occurred. On September 18, 1675, soldiers from Hadley were escorting grain from Deerfield back to Hadley for safekeeping. They reached a stream a few miles south of Deerfield, when a Wampanoag ambush took them by surprise. A company of soldiers from Deerfield arrived on the scene too late, and dozens of soldiers and several Deerfield residents were killed. Another force of 100 men happened to be nearby and together the two companies repelled the Native Americans. The so-called Bloody

Brook Massacre left Deerfield defenseless. Its residents were so shaken that they abandoned the settlement altogether.

When King Philip's War ended in 1676, settlers slowly began to return to Deerfield, and a garrison of 20 soldiers was ordered there. However, Native Americans raided Hatfield in September 1677 and then moved north to Deerfield, where they once again decimated the village. Deerfield was again abandoned. Finally, in 1682, the village was resettled in earnest. Lots were given away free of charge so long as the settlers promised to remain for three years. Deerfield's first minister, John Williams, arrived in 1686.

Another war, this one between the English and the Abenakis, broke out in 1688. Deerfield's population had reached about 240 people by this time, and the residents, mostly farmers, did not want to give up their homes and land. In 1690, a stockade was erected at the center of town, enclosing 10 houses in a safety zone.

The War of the League of Augsburg (known as King William's War in America) between England and France during 1689–1697 overlapped with the Second Anglo-Abenaki War. Now the French had begun to ally themselves with certain tribes. In 1693, Native Americans killed several Deerfield residents; then, during 1694–1696, the village came under repeated attacks, resulting in several deaths, injuries, and hostage taking. Growth continued nonetheless. A meeting house was erected in 1695, and in the same year the town was designated a "frontier town" by the government of Massachusetts. The law made it harder for settlers to leave Deerfield.

After a few years of relative calm, hostilities resumed in 1704, when a force of several hundred French troops and Native Americans marched from Canada all the way to Massachusetts with the explicit intention of attacking Deerfield. In the early morning hours of February 29, 1704, they mounted the palisades and conducted a house-by-house attack. During the 1704 raid, 41 villagers were killed and another 112 were captured and taken north to Canada. Property damage included 17 buildings destroyed and much livestock killed. Once the attack had begun, a few dozen militiamen rode in from Hatfield and Hadley, but the damage had already been inflicted.

This time, the settlement was not abandoned. The remaining residents rebuilt and the town grew. In time, some of the residents who had been taken captive returned to Deerfield. In 1722, Deerfield residents feared attack yet again during the Fourth Anglo-Abenaki War, but that war ended in 1727 without major ramifications for Deerfield.

A conference held at Deerfield in 1735 brought together the governor of the colony and other governmental officials with more than 150 Native Americans. The governor met with several tribes and expressed his desire for peace. By the mid-18th century, native populations had left the area, and the town became less important as an English stronghold.

Deerfield, Massachusetts, Attack on Event Date: February 29, 1704

Raid on and near destruction of the English settlement of Deerfield, Massachusetts, on February 29, 1704, by a combined force of French and natives, resulting in the deaths of 41 English colonists and the capture of 112 more.

As the northwesternmost town in Massachusetts, Deerfield had been a frequent target of Native American assaults during King Philip's War (1675–1676) and King William's War (1689–1697). To the English, Deerfield was merely a small, exposed settlement in the middle Connecticut River Valley. However, to various Native American groups, the town symbolized English intrusion onto their lands as well as a source for potential captives for ransom or adoption.

With the outbreak of Queen Anne's War (1702–1713), the town was once again at direct risk for assault. In May 1703, New York's governor received word of a French and Native American raiding party gathering at Fort Chambly, intent on attacking Deerfield. Similar warnings would come four more times during 1703 and into

A wood entraving from 1845 depicting the Native American and French attack on Deerfield, Massachusetts, on February 29, 1704. (North Wind Picture Archives)

early 1704. In October 1703, 2 Deerfield men were captured while working in the nearby fields. In response to this raid and repeated alarms, Deerfield's inhabitants temporarily crowded into the stockade that surrounded several houses in the center of the town. Massachusetts also sent 20 militiamen from neighboring towns to stiffen the town's defenses. But because nothing else happened, the people of Deerfield began to let down their guard.

A raiding party was indeed aiming at Deerfield, however. In the winter of 1703–1704, Lieutenant Jean-Baptise Hertel de Rouville led a force composed of 48 French and Canadians and between 200 and 250 Pennacooks, Abenakis, Hurons, Kahnawake Mohawks, and Iroquois of the Mountain toward Deerfield.

Just before daybreak on February 29, 1704, Rouville's forces struck. Some of the raiders climbed a snowdrift that had accumulated at the base of the stockade and opened the north gate. The remainder of the attackers then streamed in. The various Native American parties spread throughout the town, bent on acquiring captives for ransom and adoption. Many families in the northern part of town were surprised and quickly captured, but the uncoordinated nature of the attack allowed some English settlers to mount a defense or to hide. The settlers in Benoni Stebbins's house managed to hold out for over two hours. Alerted by sounds of the fight and a few Deerfield residents who managed to flee, militiamen from nearby Northampton, Hadley, and Hatfield came to Deerfield's relief. This makeshift force managed to drive Rouville's raiders from the village. However, as the English militiamen chased the French and Native Americans through the town's North Field, they fell into an ambush and were forced back after losing nine men.

Although Rouville's expedition suffered 10 dead (3 French and 7 natives) and 22 French and an unknown number of natives wounded, his force had devastated Deerfield. The town was left in shambles, with 17 houses and barns completely destroyed. Human losses were even greater. Forty-one inhabitants died in Deerfield, uncounted others were wounded, and 112 were carried off as captives, including the town's minister, John Williams. Two young men would escape soon after, but 21 captives would not survive the march to French and Native American communities to the north. At least 62 Deerfield captives eventually returned to New England, many of them resettling in their former Deerfield home. However, others chose to remain among their captors. Eight young girls, including Eunice Williams, daughter of the town's minister, married natives and remained among the Kahnawake Mohawks or the Iroquois of the Mountain (though one subsequently returned to New England). Ten women and 6 men married French colonists, 2 captives married each other, and all were integrated into Canadian society.

The Deerfield raid was a great success for the French. By spreading fear among the English and putting them on the defensive, Rouville had helped protect France's underpopulated colonies.

Delaware

Mid-Atlantic colony adjacent to Delaware Bay. Originally settled by the Swedish and Dutch, Delaware was captured by the English in 1664 during the Second Anglo-Dutch War. It was governed as part of New York until 1682, when the Duke of York granted Delaware to William Penn. Although Delaware had its own elected assembly, it would share the same governor as Pennsylvania throughout the colonial period.

In 1609, Henry Hudson became the first European to explore Delaware Bay. The following year an English explorer named Delaware Bay after Lord De La Warr. The name stuck to the bay, the land, and the native peoples once known as the Lenni Lenape. The so-called Delaware Indians consisted of at least 10 Algonquian-speaking subgroups. Their population of about 12,000 at the time of first contact fell to barely 1,000 by the year 1700, as European pathogens wiped most of them out. The remainder retreated north and westward into Pennsylvania.

In 1629, Dutch investors established a trading post, called Swanendael, along the coast at Lewes Creek. The first expedition, numbering 33 men, arrived in spring 1631. The following year, a Native American removed the Dutch coat of arms from its stake outside the trading post, touching off a series of incidents that ended in the massacre of the Swanendael traders. A second expedition arrived in December 1632. However, the post proved unprofitable and the investors had sold out by 1635.

In 1637, Swedish government officials and Dutch merchants formed the New Sweden Company in order to establish an American colony. Led by Peter Minuit, the first colonists arrived in March 1638 and built Fort Christina on the western side of the Delaware River near the future site of Wilmington. New Sweden's small population—no more than about 400 people at its peak—struggled against numerous setbacks. Poor harvests, lack of supplies, the loss of colonists at sea, and years of official neglect by Sweden put the colony's survival in peril. In 1651, Petrus Stuyvesant asserted Dutch authority by establishing Fort Casimir just a few miles from the main Swedish settlement. Johan Printz, who governed the colony from 1643 to 1653, kept potential enemies at bay through skillful diplomatic maneuvers. His replacement, Johan Rising, ousted the Dutch garrison from Fort Casimir on May 21, 1654. Stuyvesant

seized on Rising's action as a rationale for invading New Sweden, and with seven ships and more than 300 men, he recaptured Fort Casimir on September 1, 1655. He accepted the surrender of New Sweden on September 15, 1655. Many Swedes took advantage of the generous terms of surrender and remained in Delaware.

A Dutch community, New Amstel, grew up around Fort Casimir. In 1659, Dutch settlers established another settlement, Whorekill, on the coast near modern-day Lewes. After the 1664 English takeover of New Netherland, New Amstel became New Castle. New York loosely governed Delaware, communicating with the distant territory by sea. Maryland planters moved into southern Delaware, bringing tobacco culture and slave labor to the local economy. By the end of the colonial period, Delaware plantations possessed some 7,000 slaves, or 20 percent of the total population, whereas about 10 percent of the population was of Dutch or Swedish origins.

The brief interlude of Dutch control during the Third Anglo-Dutch War gave Gov. Charles Calvert of Maryland a chance to gain a foothold in Delaware under the guise of striking a blow for England. He sent a troop of 40 horsemen to attack the largely Dutch settlement of Whorekill. On Christmas Eve 1673, the Marylanders plundered and burned the entire settlement, leaving the inhabitants empty-handed in the dead of winter. Neighboring Native Americans sheltered and fed the homeless until Dutch authorities sent aid.

Back under English control, Delaware remained an unofficial part of New York until 1682. At that time Penn sought to acquire territory that would give Pennsylvania direct access to the sea, so the Duke of York informally granted Penn possession of Delaware. During their association with Pennsylvania, the three counties on the lower Delaware River—New Castle, Kent, and Sussex—were called the "Lower Counties." Delaware's counties sent representatives to Pennsylvania's assembly, where they had difficulty promot-

ing their interests. Pennsylvania's pacifist Quaker majority declined to fund defense of the Delaware Valley. It also ignored coastal defense because Delaware bore the brunt of attacks by sea. In 1698, pirates looted the coastal settlement of Lewes. Lewes endured a second plundering in 1709 by French sailors, and in 1748 French and Spanish privateers attacked two plantations.

Observing the contention in the combined assembly, Penn permitted Delaware to convene its own assembly. The Delaware assembly first met in 1704. It quickly issued paper currency to pay for defense and passed its first militia law. Delaware militiamen participated in the campaigns of King George's War and the French and Indian War. The outbreak of the French and Indian War encouraged the displaced Delaware tribe to cross Pennsylvania and raid settlements in the Delaware Valley. Delaware raised a 4,000-man militia for its own defense, and in 1758 sent some 300 of its militiamen to join the campaign in western Pennsylvania.

Delawares (Lenni Lenape)

Native American group of the Algonquian linguistic family located, at the time of first European contact, in modern-day Delaware, New Jersey, southeastern New York, and southeastern Pennsylvania. The Delawares (Lenni Lenape) were one of the most influential groups of native peoples during the colonial period. Their history is inextricably tied with that of British and French colonization in North America.

From the early 17th century to the beginning of the American Revolutionary War, the Lenni Lenape engaged in trade, diplomacy, and warfare with the Swedes, Dutch, British, French, and finally, the nascent American nation. By the 1680s, however, they had entered into a lengthy peace with the English colony of Pennsylvania. Unfortunately, the long peace with the Quaker colony gave way in the 18th century to events that would see the Delawares much reduced in numbers, influence, and territory.

Lenni Lenape, which translates as "original people," is the term the Delawares used to describe themselves. In recognition of this

Delaware Native Americans. The Delawares (Lenni Lenape) were among the most influential of native peoples during the colonial period. (North Wind Picture Archives)

claim, other Algonquian peoples of the northeast often referred to the Lenni Lenape as "grandfathers." The English christened them "Delaware," as they lived mainly along the Delaware River.

Lenni Lenape myth holds that they migrated across an ocean to the west, crossed the continent, and settled on the eastern seaboard. The story of the Lenni Lenape migration has been recorded in a pictographic record, of debatable authenticity, known as the *Wallum Ollum*. In any case, the Delawares soon settled into a seasonal round of life in which they planted maize, beans, and squash in the spring; fished and clammed along the coast in the summer; and hunted in the fall.

The Delawares had their first recorded contact with Europeans in 1609. In that year, according to a native story recorded by Moravian missionary John Heckewelder in the early 19th century, they encountered Dutch explorer Henry Hudson. Uncertain if Hudson's ship was an island or a large canoe, reportedly a few Lenni Lenape in a canoe approached cautiously. Hudson welcomed them aboard and showered them with gifts. During a subsequent visit from the Dutch, the Lenni Lenape learned more about the character of Europeans. Amused that the natives used axe heads as pendants and stockings as tobacco pouches, the Dutch demonstrated the proper use of these items. When the Dutch asked for a piece of land that could be enclosed by an ox hide, the Lenni Lenape agreed, then watched in dismay as the hide was cut into a single, long, continuous strip that encircled a much larger area than the intact pelt. The Lenni Lenape now knew they would have to exercise caution in their dealings with the newcomers.

The Delawares probably had contacts with the Swedish colonies in what is now southern Pennsylvania and New Jersey. The Swedes however, had difficulty telling one group of native peoples from another, so it is impossible to ascertain this with certainty.

The most notable contacts between the Lenni Lenape and the Europeans began with the founding of Pennsylvania in the 1680s. Although William Penn, like other Englishmen, did not view natives as equals, he did believe that they should be dealt with fairly. Penn duly purchased lands from the Delawares and maintained peaceful relations with them. Indeed, Penn's dealings with the Delawares were so amicable that other Native Americans moved from other English colonies to Pennsylvania.

The era of peaceful dealings with Pennsylvania came to an end, however, when Penn's heirs assumed control of the colony in the early 18th century. Relations became strained as the colony expanded and came to a head with the fraudulent land deal known as the Walking Purchase (1737). In short, Penn's heirs produced a document that they claimed Penn and the Delawares had signed years earlier. The questionable agreement had purportedly granted a tract of land to the colony equivalent to what a man could traverse in a day and a half. The colony fixed the walk so as to acquire considerably more land, and the Delawares protested and refused to move. Realizing that they could not force the Lenni Lenape out of the colony on their own, Pennsylvania called on the Iroquois Confederation to evict them.

Some Lenni Lenape indeed complied with the order of the Onondaga spokesman Cannestego that they relocate to western Pennsylvania. A few, however, remained in the eastern part of the colony and New Jersey. But the majority went west, beyond the Allegheny River and Monongahela River and into the Ohio Country, far beyond the effective reach of the Iroquois and beyond easy reach of English traders.

In the 1740s, English traders began to establish trading relations and posts in the Ohio Country, allowing the Lenni Lenape to trade with them and obtain superior quality English goods. The French, who also claimed the Ohio Country, evicted the English traders. By pressing their claims, they helped precipitate the French and Indian War (1754–1763). The French promised the Delawares that they could regain their old lands. Convinced that the French would win the war, western Delawares joined them and launched attacks on English settlements in western Pennsylvania and Virginia. Delaware warriors also participated in the 1755 battle that led to the defeat of a sizable British force under Major General Edward Braddock attempting to take Fort Duquesne from the French. As the war went on, however, the French had difficulty supplying their native allies with weapons and trade goods. Thus the Lenni Lenape, and other natives, sat out the later stages of the conflict.

Among the Lenni Lenape people in the Ohio Country, a prophet named Neolin came to prominence when he began preaching a movement that called for Delawares and other natives to forsake items of European manufacture, and to return to the ways of their ancestors. It was too late for natives to do this, as they were by then

too dependent on European goods. Nevertheless, Neolin's message was co-opted by the Ottawa-Annisgheg chief Pontiac, who fomented a rebellion against the English in 1763.

The Lenni Lenape remained split after Pontiac's Rebellion. With the beginning of the American Revolutionary War, many sided with the British. However, a few sided with the Americans, becoming the first group of natives to sign a treaty of alliance with the fledgling new nation in 1778.

Denonville, Jacques-René de Brisay de

Born: December 10, 1637 Died: September 22, 1710

in 1681, and brigadier general in 1683.

French-born military officer and governor of New France (1685–1689). Born on December 10, 1637, into the lower nobility on the family estate at Denonville, France, Jacques-René de Brisay was the eldest surviving son in his family and inherited the title of Marquis de Denonville. After receiving only a cursory education, Denonville joined the army and rose to the rank of captain in the Régiment Royal. During the following decade, he campaigned against the Barbary pirates and fought in the Dutch War of 1672–1678. In 1668, he was commissioned a captain in the Dragons de la Reine (Queen's Dragoons). Promoted to lieutenant colonel in 1673, he became colonel in 1675, inspector general of dragoons

By a commission dated January 1, 1685, King Louis XIV appointed Denonville governor of New France. Apparently singled out for what were regarded as his outstanding military abilities, Denonville replaced Joseph-Antoine Le Febvre de La Barre, who had failed to neutralize the Iroquois threat. Shortly after arriving at Quebec on August 1, 1685, Denonville traveled as far as Fort Frontenac (Kingston, Ontario) at the head of Lake Ontario to survey the colony's defenses. As governor of New France, he contributed, among other things, to the formation of a local military nobility—a new colonial

elite—by successfully advocating that the commissioned ranks of the troupes de la marine be opened up to Canadians.

Denonville perceived that the English constituted a formidable peril. He believed that only after the devastation (or purchase) of the colony of New York would the Iroquois yield to the French. But he found that the Crown was unwilling to allocate the resources necessary for such a massive enterprise. Targeting interloping traders, the governor ordered the capture of Albany merchants in the Great Lakes region and dispatched an expedition to capture the posts on Hudson's Bay in 1686. In June of the following year, he launched a surprise expedition against the Senecas, the most bellicose of the Five Nations. The campaign was not as decisive as Denonville had hoped, but it led to a peace settlement.

In 1689, forewarned by the authorities of New York that the imperial powers were now at war in Europe, the Iroquois resumed their raids on French settlements. Opting for a consolidation of the colony's defenses, Denonville ordered that western posts, including Fort Frontenac, be abandoned. Simultaneously, he spurred his Abenaki allies against New England.

In October 1689, Louis de Buade de Frontenac arrived to replace Denonville as governor. The official reason for his recall was that he would be of greater use to France in the European war theater. As a testament to his satisfactory performance, on his return to France the marquis was promoted to the rank of maréchal de camp des armées du roi (major general). He later served as deputy governor to the Duke of Bourgogne, the Duke of Anjou, and the Duke of Berry. He died at his chateau at Denonville on September 22, 1710.

Desertion, Army

Desertion is the act of leaving service in a military force without the intention of returning, or of being absent from one's military unit without permission for an extended period. Desertion has been a consistent problem for every army and navy in history, but certain factors exacerbate the problem. Chief among the causes of desertion is low morale, whether due to boredom, poor service conditions, harsh discipline, or battlefield failures. Armies comprised of forcibly recruited soldiers, whether impressed or conscripted, have

typically had higher rates of desertion. Desertion rates have also usually increased during periods of economic growth.

In the colonial period in North America, opportunities for desertion depended on service location. In particular, the friendliness of local populations affected soldiers' decisions to desert. In the English colonies, deserters could often flee to frontier regions or other colonies with little fear of capture. Occasionally, European deserters joined Native American societies as an alternative to military service. However, for troops posted in the wilderness with no local friendly populations, the incidences of desertion remained much lower than for troops on garrison duty in major population centers. Regulars who deserted often did so to take employment in colonies short of laborers and were shielded by colonial employers, who provided higher wages and required less discipline than military service.

By definition, desertion is limited to enlisted personnel, who, unlike officers, could not resign their position at will. The penalty for desertion varied depending on country and time and often depended on whether the desertion occurred during peacetime or wartime. Peacetime deserters returned to the ranks faced harsh disciplinary measures. Wartime deserters, however, faced possible execution if apprehended.

One of the most common and popular forms of desertion was to desert while being held as a prisoner of war, often at the urging of the captor. European forces, particularly the British Army, routinely recruited from prisoner-of-war populations. The penalty for deserters captured fighting for the enemy has almost always been summary execution.

The division between regular army forces and provincial troops contributed to desertions during the colonial period. Regular officers complained that provincials were lazy, untrustworthy, and poorly trained and disciplined. The provincials, in turn, resented the harsh discipline meted out by regular officers, and had strong opinions about where and how their services could be compelled. Provincials who deserted often returned to their homes and resumed their peacetime occupations. Not surprisingly, desertion rates increased during planting and harvesting periods. At times, entire provincial units deserted en masse and returned to their homes. Such desertions were rarely punished by imperial authorities, however.

Desertion, Navy

In the age of sail, all of Europe's major navies experienced the problem of sailors deserting their ships or posts. Because of its large and constant presence in North American waters and ports, the British Navy faced the most severe threat of desertion of the major colonial powers. Numerous factors influenced seamen to desert their ships. Positive motivations, or pull factors, included the opportunity to earn higher wages on merchant ships (especially in wartime) or the desire to start over in a new but not completely foreign environment. Negative motivations, or push factors, included impressment (the individual might have been forced against his will into naval service), harsh discipline and officer brutality, and concerns over poor food, cramped conditions, and disease aboard ship.

The British Navy categorized men absent from duty as deserters once they had missed three consecutive weekly musters. By the British Articles of War, desertion was punishable by death, although the navy executed a very low percentage of its deserters. The navy chose instead to make examples of captured deserters by flogging them in front of their peers. In the French and Indian War (1754–1763), a conflict for which historians have reasonably reliable figures, the British Navy lost about 7 percent of its personnel annually to desertion, or between 36,000 and 40,000 men during the entire war. Of those numbers, only about a dozen were actually hanged.

Geography played an important role in a seaman's decision to desert. American colonial seaports proved especially attractive because of their cultural similarity and shortages of skilled seafarers there. American merchants in need of experienced sailors to man their ships would do everything possible to entice them away from the navy. Merchant labor agents, known as crimps, were not above tricking or even spiriting sailors away from naval vessels. British captains sought to circumvent this, but not always with success. Limiting shore liberty and anchoring off shore did not always work, as seamen seeking to desert might lower a boat over the side and row to shore or else attempt to swim the distance. Desertion continued to plague British ships in American waters and was later a contributing factor to the War of 1812.

Detroit

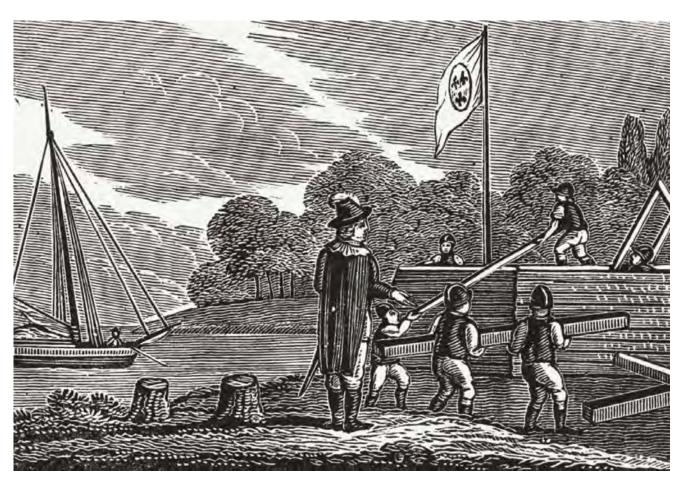

French trading center and defensive outpost. Captain Antoine Laumet, also known as Lamothe de Cadillac, established Detroit in 1701. Cadillac claimed, and the French Crown hoped, that the post constructed on the Detroit River, which connects Lake Huron to Lake Erie, would block English attempts to gain access to the upper Great Lakes and France's key native allies. Detroit was controlled by the French from 1701 to 1760, by the British from 1760 to 1796 and 1812 to 1813, and by the United States from 1796 to 1812 and then from 1813 to the present.

The French, British, and Americans all used Detroit as a center for Native American trade and relations. Under all three regimes,

Detroit regularly witnessed treaty delegations, the distribution of presents, war councils, and visits by native dignitaries from as far west as the Plains and as far south as New Orleans.

Peace with the Iroquois in 1701 enabled the construction of the palisade and bastions, called Fort Pontchartrain, and the establishment of a settlement. On arrival, Cadillac and his men began construction of the fortifications, which were largely completed by October 1701. The planting of crops and arrival of two white women (the wives of Cadillac and his aide) that fall signaled that this French post would be different from others within the Great Lakes region. The settlers arranged themselves along the customary pattern of river lots as seen in New France's seigneurial system.

Cadillac did not intend for the settlement merely to be populated by French men and women. He wanted native nations to gather at the site, where they would come under the sway of the French language, religion, culture, and commerce and, most important, act as a ready source of manpower to defend France's imperial claims in North America. By 1703, Ottawas, Hurons, Miamis, Ojibwas, and Loups had settled in the region. By 1707, the settlement had more than 1,000 natives living nearby and a French population of over 250. When the British assumed control of the fort and settlement in 1763, the population stood at approximately 1,000 French and 2,500 natives.

Wood engraving from 1840 depicting construction of a fort at Detroit. (The Granger Collection)

Natives besieged Detroit in 1708, 1712, and 1763. In 1708, a disagreement between the Ottawa and Miami tribes led to an armed clash. The French allowed the Miamis to take shelter in Fort Pontchartrain, which Cadillac now commanded. As a result, the Ottawas attacked the post. In 1712, another conflict between the Fox Indians and various French allies resulted in the massacre of the latter and engulfed the region in a series of wars. In 1763, with the British now in control of the fort, Detroit was besieged by Chief Pontiac and his supporters during Pontiac's Rebellion. The British post survived Pontiac's initial attack thanks to a timely warning and survived the resulting siege by the appearance of British reinforcements as well as the support of the Ojibwa chief Wabbicommicot. The last siege of Detroit took place in 1812 during the War of 1812.

By 1760, Fort Pontchartrain de Detroit covered an area of approximately 200 by 100 yards and contained within the palisades some 300 civilian and military buildings. The palisades had been extended several times to accommodate new buildings, which created an irregular shape to the fortifications. Additionally, being wooden, the palisades were in need of constant repair because of the fort's proximity to the river. The fort was maintained and expanded until after the War of 1812, when peace and more settlements made the palisades irrelevant and unnecessary.

Devil's Hole Road, Battle of

Event Date: September 14, 1763

Ambush by Native Americans of a British supply convoy during Pontiac's Rebellion (1763). The British routinely sent supply convoys to Detroit overland from Fort Niagara to Lake Erie. This portage passed through Seneca territory. On September 14, 1763, a combined force of 300 Seneca, Ottawa, and Chippewa warriors set an ambush for a British convoy on its way to Detroit. The Indians chose a location near a ravine close to the whirlpool known as Devil's Hole in the Niagara River Gorge.

The British convoy consisted of 25 wagons accompanied by only 31 soldiers. The Native American ambush took the convoy by surprise and killed all but 2 of the soldiers. The musket fire alerted two

companies of the British 80th Regiment nearby. These men rushed to rescue their comrades, but instead ran into a second ambush. During this engagement approximately half of the soldiers from the 80th Regiment became casualties.

Between the two ambushes, some 80 British soldiers were killed. The ambushes effectively closed the portage between Lake Niagara and Lake Erie and prevented the British from being able to resupply Detroit. The British garrison at Fort Niagara spent the next several weeks trying to reopen the portage, but the Senecas continued to attack the convoys even when they were well guarded. This, combined with deteriorating weather conditions, halted all attempts to resupply Detroit. The garrison undoubtedly would have been starved into surrender but Detroit was saved by Pontiac's truce.

Dieskau, Jean Armand, Baron de

Born: 1701 Died: 1767

French Army officer. Born in Saxony in 1701, Jean Armand, Baron de Dieskau, began his French military service with the Maréchel de Saxe, whom he served as an aide-de-camp. Dieskau fought under de Saxe during the War of the Polish Succession (1733–1738) and the War of the Austrian Succession (1740–1748), and he was a colonel of cavalry at the Battle of Fontenoy in May 1745. In 1747, he was promoted to major general and became the military governor of Brest.

In 1755, Dieskau became the commander of French regulars in North America, sent to oppose British troops under Major General Edward Braddock at the start of the French and Indian War (1754–1763). Dieskau's instructions, however, made him subordinate to the governor-general of Canada, Pierre de Rigaud de Vaudreuil. As a consequence of Braddock's 1755 defeat in battle near the Monongahela River, the French secured papers revealing British strategy for the coming campaign. Vaudreuil then dispatched Dieskau to take Oswego on Lake Ontario. He recalled him, however, when a force under Colonel William Johnson threatened Fort St. Frédéric. Dieskau proceeded down the Richelieu River, sent some of his men to Fort Frontenac, and moved toward Fort Edward. Johnson began to construct a fort at the head of Lake George (later site of Fort William Henry) and north of Fort Edward. Intelligence garnered from a prisoner led Dieskau to believe that the British

force was split, leaving 500 men at Fort Edward. Given this information, Dieskau split his force in violation of orders. He took approximately 200 regulars, 600 militiamen, and 700 native warriors and advanced toward the fort.

On reaching Fort Edward, his native allies refused to attack a fortified position that had cannon, so Dieskau turned to assault the British at Lake George. That same day, on September 8, 1755, Johnson had sent a relief column of 1,000 men to relieve Fort Edward, but Dieskau's planned ambush of this force failed. The failure can be attributed to either unauthorized native communication with the British, or the French having prematurely revealed their position. The British fled back to Lake George, and when Dieskau's regulars reached them, he ordered a frontal assault, which failed. Dieskau was wounded three times before the French retreated under his second-in-command.

The British took Dieskau prisoner, treated his wounds, and held him until 1763. At the end of hostilities that year, he returned to France. Dieskau died at Suresnes in 1767.

Dinwiddie, Robert

Born: October 3, 1692 Died: July 27, 1770

Lieutenant governor of Virginia at the outbreak of the French and Indian War. Born in Germiston, Scotland, on October 3, 1692, Robert Dinwiddie was one of nine children. Dinwiddie graduated from the University of Glasgow in 1711.

Dinwiddie amassed wealth as a merchant and made influential friends in Parliament. In 1721, he was appointed agent for the Admiralty in Bermuda. From 1727 to 1738, he was collector of the customs for Bermuda. Then, during 1738–1749, Dinwiddie was surveyor general of customs for the Southern District of America (those colonies from Pennsylvania south). In 1749, he returned to England, where, in July 1751, he was appointed lieutenant governor of Virginia. He arrived in the colony with his family that November.

Dinwiddie served at the pleasure of two absentee Virginia governors, Willem Anne van Keppel, Second Earl of Albemarle, and John Campbell, Fourth Earl of Loudoun. Dinwiddie's troubles began in 1753, when he discovered that the French were building forts in the contested Ohio River Valley. The new French governorgeneral at Quebec, the Marquis de Du Quesne, escalated tensions when he evicted all British traders from the region. Dinwiddie, a shareholder in the Ohio Company of speculators in western lands,

Robert Dinwiddie, lieutenant governor of Virginia, who dispatched a militia force under Major George Washington into the Ohio River Valley, touching off the French and Indian War (1754–1763). (The Library of Virginia)

responded to the news by dispatching Virginia militiamen under Major George Washington into the contested territory to induce the French commanders at Fort Presque Isle (now Erie, Pennsylvania) and Fort Le Boeuf (now Waterford, Pennsylvania) to vacate that region. When Washington subsequently reported that the French refused to abandon their posts, Dinwiddie prepared for war. The expansionist Dinwiddie encouraged other royal governors to join the fight, and he mobilized Virginia's militia and lobbied native leaders for their support. He also authorized construction of Fort Prince George, a small wooden fortification at the confluence of the Monongahela, Ohio, and Allegheny rivers (present-day Pittsburgh). The French heightened tensions by attacking the isolated outpost in April 1754 and constructing Fort Duquesne in its place.

Not one to shy away from a fight, Dinwiddie responded by sending now Colonel Washington and 132 men to the region. During the ensuing campaign of 1754, Washington's army attacked an enemy force led by Joseph Coulon de Villiers de Jumonville. The ambush routed the French, killing Jumonville and 9 others. Shortly thereafter, the French counterattacked on July 3, 1754, Washington surrendered the hastily constructed Fort Necessity in Pennsylvania. Although captured, Washington and James Mackay, commander of the South Carolina reinforcements, were allowed to return home after signing the articles of capitulation. These events brought on the French and Indian War (1754–1763).

Convinced that the French encroachment must be stopped, Dinwiddie responded to Washington's defeat by helping newly arrived

British major general Edward Braddock plan an invasion of the Ohio Valley. Following Braddock's bungled 1755 campaign, Dinwiddie worried about Virginia's exposed frontier settlements.

His persistent lobbying eventually persuaded the assembly to fund military campaigns, but for defensive purposes only. As a result, Dinwiddie encouraged other colonial governors to launch offensive thrusts against the French while he tried to halt the Shawnee raids that ravaged Virginia's western communities. Dinwiddie also solicited the aid of Cherokee and Catawba allies in an effort to defend the colony.

Despite Dinwiddie's efforts, the raids continued unabated until 1756. Soon the stress became too much for Dinwiddie to bear. In January 1758, he left Virginia before the tide of war had turned in England's favor. The chronically ill Dinwiddie died at the Hot Baths of Clifton in Bristol, England, on July 27, 1770.

Discipline, Army

In 18th-century Europe, officers were almost always members of the upper class. The rank-and-file, however, were from the lower classes, and they were recruited, often by force or deception and for long terms of service. All European armies used mercenaries, so there was little to keep the armed forces motivated other than discipline, which was usually harsh. Such discipline included up to 1,000 lashes, hanging, or death by firing squad. Militaries instilled discipline (as well as morale) by continuous drill during training, but semiprofessional militias fit the needs of colonies dominated by farmers. The regular military was a full-time occupation, whereas the militia was part-time on an as-needed basis. The Dutch in New Netherland relied on a militia, as did the French, Spanish, and English from the earliest settlements in North America until the American Revolution.

Armies relied on greater discipline to increase efficiency in the loading and firing of firearms in prescribed sequences. From the time of Maurice of Nassau during the Dutch Revolt and Gustavus Adolphus of Sweden during the Thirty Years' War (1618–1648), the Dutch led the way in infantry drill. The system was expensive in time and junior officers' attention, but it was necessary to convert

the dregs of society into a fighting machine capable of withstanding the horrendous experience of 17th-century warfare.

The Dutch also provided the English with the underpinnings of the court-martial. The court-martial of the 17th century was based on the English courts of chivalry as well as the military laws of Adolphus and the Dutch military code. The English version became the Mutiny Act of 1689, which—with modifications—lasted until 1879.

For the military of New France, drill was supposed to occur daily, but it was often inappropriate to the type of war fought in the colonies, so enforcement was lax. Crime was another matter. Soldiers committed a large number of rapes, assaults, duels, thefts, frauds, and other crimes in the colonies. Punishments were to be exemplary, so they were harsh, as they were for civilians. Trials for serious crimes were held in a joint military-civilian court where torture-induced testimony was permissible. Punishments ranged from public flogging, service in the galleys, and branding all the way to the death penalty. Military courts dealt with minor offenses such as indiscipline, drunkenness, and morals/manners violations. Punishment for theft, the most serious petty crime, was generally running through two lines of one's comrades who struck the convicted man's back with ramrods or musket butts. The offender had to renew his oath after running the gauntlet before serving a month in prison.

British punishments were harsher. The British used the cat o'nine tails, a whip with nine pieces of knotted cord. The whip would be lashed across a prisoner's back perhaps several hundred times. The maximum punishment in the British Army for the lash was 1,000 times. It did not take many lashings for a man's back to be completely cut open, and few men could withstand the maximum punishment.

Desertion was less common in the New World than in Europe, as there were fewer places to go. During 1635–1684, the penalty in the French Army for desertion was death, thereafter life in the galleys, with a revival of the death penalty in 1717 (those sentenced to the galleys drew lots to see which one in four would be shot instead). Mutiny, a capital crime, occurred infrequently.

In New France, militia enrollment was mandatory for all men between the ages of 16 and 60 or 65, excluding the clergy and certain public officials. The colony provided each militiaman with a musket. Local militias saw duty frequently during the 17th and 18th centuries. During the French and Indian War (1754–1763), New France instituted the *levée en masse*, a draft of all male inhabitants.

In Spanish territories, discipline was lax. Although Spanish forces had used disciplined and coordinated infantry in conquering the Aztec and Incan empires, once the major conquests were complete, Spanish colonial authorities authorized merchants to finance expeditions to expand their territory and provide use for the surplus population. The members were rarely experienced soldiers, but there was no need for discipline or sophisticated tactics against the indigenous populations. Throughout the conquest, from the days of Cortés and Pizarro, the Spanish chose to capture or co-opt indigenous leaders and rule through them. For these expeditionary forces, rank was largely irrelevant, and arms such as pikes, crossbows, and swords were familiar to all. As long as the men remained in a com-

pact group, superior firepower would prevail. Men often had to provision and otherwise finance themselves, and payment was in the form of shares of booty gained. Because there was little military discipline or regulation, expeditionary leaders had a hard time maintaining morale and loyalty within a group with diverse interests and allegiances. As such, friends, neighbors, and relatives were preferable to strangers as members of the expeditionary forces.

In the 18th century, the authorities of New Spain established a line of forts from Texas to California. The main defense force was the militia, which enrolled all men between the ages of 16 and 40 for a 10-year term of service and called them up in time of emergency. Militiamen supplied their own arms and horses. Training was sporadic, and the militia was generally poorly trained and undisciplined.

The Spanish colonial army was a volunteer force, but army life was not attractive. Wages were minimal and duty long at isolated forts. Advancement was slow, with the officer corps reserved for Spanish-born *peninsulares* and sometimes Spanish-blood creoles. With poor discipline and morale, the army was ineffective and plagued by desertion, which normally went unpunished. Soldiers routinely brought their families with them or married local women. Otherwise, their conduct toward indigenous people was aggressive and problematic. The Marqués de Rubí toured the northern frontier in 1766–1768 and found soldiers untrained in the use of firearms, heavily indebted to profiteering officers because their salaries were in arrears, and employing deteriorated equipment and arms. Rubí recommended various reforms, including issuance of proper equipment, regular pay, and suitable training. Nevertheless, colonial Spanish discipline remained lax.

In the English colonies, militia service was much the same. The English colonists, however, inherited from the mother country the traditional fear of a strong standing army as an instrument of tyranny, and thus preferred to rely on militia service in most instances, save pitched warfare when professional soldiers would be called in. Regulations varied from colony to colony but there was general agreement that service was compulsory, save for civil servants. All able-bodied males between certain specified ages would owe service to the colony and had to enroll in the local militia. Every colony had a compulsory training law, except Quaker-influenced Pennsylvania, which nevertheless had a voluntary militia.

English colonial governments expected the men to provide their own arms. As colonies developed elite groups, the elites would often form artillery and other units with higher expenses and thus higher status than the regular foot soldiers of the militias. Colonies stockpiled arms and powder for emergencies and had the power to draft or impress under martial law conditions in emergencies.

Early settlements had militia drill once a week, usually after Sunday church services, but over time and with receding threats, units trained once a month, with some training only once a year. Each militiaman had to appear at his town or county seat on prescribed training days, armed and equipped for duty. Generals and colonels were appointed by the governor or assembly, but militia companies normally elected their officers.

Militia organization was by county or township, but expeditions rarely required more than a quota from each unit. Militia leaders usually selected their youngest members for service: volunteers or draftees who had the option of providing substitutes. The expeditionary force usually had no cohesion. Service was short-term, and the men returned to their farms and businesses as quickly as they could, often before the expedition had ended.

As the frontier moved west, the Native American threat did too. Eastern militias became more lax, their training more and more sporadic. Training day became often a day of festivities rather than drill exercises. Even on the frontier, training was European-style openfield maneuvers rather than proto-guerrilla-style forest maneuvers. To complicate matters, militiamen were not paid for drills, which did not sit well with most soldiers. To encourage attendance, the colonials used taverns as drill sites. Thus drill day became a break from the hard work of farming and a social event. Drill exercises were often sloppy until officials began reserving beer for drill's end.

Understandably, militia discipline was less harsh than that of the professional European forces. Commanders took the time to explain why something was wrong, how it could harm a unit made up of neighbors, and why it should stop. Men who elected their officers and came from a stock of independent farmers and townsmen were less in need of harsh discipline and floggings than were mercenaries and draftees held by fear or force. Generally, this system worked well.

Discipline, Navy

Until midway through the 17th century, European navies were reflective of their societies, with rank dependent largely on social class. The first professional navy arose during England's Commonwealth in the mid-17th century, and thereafter the better trained, better supplied, better disciplined British Navy dominated the seas.

The Spanish Navy, however, dominated the 16th century. A preprofessional force, it was a less-rigid reflection of the structure of Spanish society. The ships of Spain were private vessels driven by profit motive rather than patriotism. The seafaring life gave enterprising men an opportunity to rise from one class to another through intelligence and hard work. Rarely, a skilled sailor rose to ownership, but the owner was merely a craftsman, too. Generals and admirals came from the nobility, and noble passengers on merchant vessels thrust into combat sometimes took command from the captains.

The routine operation of the ship fell to a master and the stations below him: pilot, disciplinary officer, surgeon, and on down to boatswain, and of course, the common sailor, classed as either experienced men or apprentices. The crews were illiterate, tough, cynical, and kept in line largely through fear of authority.

Sailors of all navies of the time lived with tedium, lack of privacy, rats, and bad food. Conditions were often brutal, with a high mortality rate. Discipline was rigid, flogging liberal, and sailors who reached their limits often deserted, mutinied, or joined pirates.

In the pre-professional era, Spain had the superior navy, but Spain suffered from domestic inflation, the decrepitude of its fleet, and the rebellious Dutch. Indeed, Spain essentially lacked the naval values and tradition that England and the Netherlands enjoyed.

The Dutch maintained naval supremacy by relying on armed merchant vessels manned by civilian sailors capable of fighting when necessary. The civilian nature of the Dutch Navy did earn it great support among the people, as was not the case with the Dutch Army. The army was professional and mercenary, with few blood ties to the Dutch people. The navy, on the other hand, was home to officers from the Dutch canals and sailors from the back streets. The admirals were almost pirates, full of heroic adventures. Reputedly, the Dutch had less trouble recruiting a thousand sailors than a hundred soldiers. In 1670, in fact, 10 percent of Dutch men were sailors.

The Dutch originated "keelhauling," an extreme form of punishment copied by other navies during the 15th and 16th centuries. A rope rigged from yardarm to yardarm was stretched under the ship. The offender was attached to the rope, sometimes with lead or iron weights, and was hoisted up one yardarm, dropped into the sea, hauled beneath the ship, where his body rubbed against sharp barnacles, and raised up by the other yardarm. When he recovered his breath, he was keelhauled again.

Dutch discipline could be harsh, with fines levied for blasphemy, drunkenness, and spilling food overboard. Solitary confinement was one punishment for fighting or gambling. Another option for a brawler was to have his hand pinned to the mast with his knife; the sailor had to figure out how to free himself without damage. Insulting an officer brought keelhauling, and mutiny, murder, and sodomy were capital crimes. Discipline was controlled by a system of councils: officers, sailors, and a broad general council. As in all navies, the captain had final authority.

In the mid-17th century the Anglo-Dutch Wars proved the undoing of the Dutch merchant warriors at the hands of England's professional, full-time navy. The Dutch simply lacked the manpower to go toe-to-toe with the English. Their sailors were merchants and only reluctant warriors. The Dutch government had to pay men bonuses in order to get them to join the fleet, which was small and deteriorating. The reputed lack of discipline and morale in the Dutch navy led the English to define Dutch courage as arising from a bottle of schnapps.

The French Navy, like its Spanish counterpart, was officered by aristocrats, who had no status at stake in victory or defeat. Promotion determined by social standing often produced poor leadership. The major contribution of the French to naval discipline was the institution of marines. Originally army units assigned to ships, the marines were exempt from ship's discipline until they were reassigned to the navy.

Minister of Marine Jean-Baptiste Colbert (1669–1672), who is credited with creating the French Navy and the marines, built a navy equal to any other in Europe. Colbert expanded the navy tenfold during his tenure, but it was second on the sea to the French mercantile companies and second in the war ministry to the army. By the outbreak of the French and Indian War, it had only 60 ships of the line manned by poorly trained and disciplined crews. French deserters crewed many pirate ships.

England enjoyed all the advantages of excellent and highly motivated officers, a political focus on the navy, but also perhaps the harshest discipline of any European navy. Until the mid-17th century, the only restraint on ships' captains was the guidance of the lord high admiral.

The Long Parliament of 1645 required written court-martial records and enlisted membership on courts-martial of sailors, and courts-martial became regularized after 1661. Even so, English captains at sea retained the right of summary punishment. Courts-martial allowed corporal punishment including fines, up to 48 lashes, penal servitude, and death. Mutiny earned hanging at the yardarm, which meant slow strangulation, not a quick snapping of the neck. As late as the early 17th century, the English Navy authorized a maximum of 1,000 lashes, usually fatal, for mutiny and other serious offenses. Flogging among the fleet was practiced until 1735 for attempted escape or striking an officer. Under this punishment, the offender was fastened to an upright timber on a ship's boat then rowed about the fleet, giving each boatswain's mate an opportunity to lash the prisoner.

Sleeping on watch drew a first-offense punishment of having a bucket of sea water poured over the offender's head. But because sleeping on watch might place the ship and its crew in jeopardy, punishments for second and third offenses were more severe and punishment for the fourth offense was fatal. The prisoner was slung in a basket below the bowsprit with a knife, bread, and ale. The options were to starve to death or cut the basket loose and eventually drown.

From the 18th century, the British Royal Navy relied on impressment, the forcible conscription of sailors, to crew many of its warships. The British impressed Britons as well as sailors from other nations between the ages of 18 and 55. Because service in the navy was far from attractive for the sailors, impressment was often carried out by force or kidnapping.

During the French and Indian War (1754–1763), the British Navy instituted a divisional system whereby each officer had personal responsibility for a section of sailors, reducing the arbitrary regime of the boatswains' mates. In general, British sailors were better cared for than either their French or Spanish counterparts. They were bet-

ter officered, as well. English captains knew that victories meant prize money and social status, maybe even a comfortable retirement. Thus, leadership skills were paramount to personal success. Not until 1866, however, was the British code softened, and even then the captains reserved the power of summary execution of sentences.

Officers and sailors alike understood that discipline allowed officers to control crews, which often included the worst brigands of society. In combat, roughly 80 percent of a ship's crew serviced its guns; only a small percentage actually sailed the vessel. Busywork and discipline kept hundreds of men from becoming bored or sullen. Failure to follow orders could cause the loss of the ship to heavy weather or enemy action. The sailors understood that discipline was necessary. And as long as it was predictable and fair, even flogging was accepted. Sailors slow to their tasks could receive a blow from the end of a rope. By the late 18th century, captains generally allowed no more than 12 lashes at a time so the ship would not lose the services of a seaman.

Punishment was always public and dramatic, so as to maximize its deterrent effect. The crew formed on deck, with marines between officers and sailors. The crew performed some of the punishments themselves. Participation in the punishment of those who betrayed the communal trust helped to bond the men. Lesser offenses such as thievery earned a run through the gauntlet. The crew lined up in two rows, face to face, holding their knittles (knotted rope). The offender walked bare-backed and slowly through the lines while the crew beat him with the knittles. Flogging was actually considered to be more humane than the other punishments because it was more easily controlled. There was no risk of excessive bruising that might come from the gauntlet, or of accidental drowning, which could occur with dunking or keelhauling. To keep sailors working, a wise commander recognized that denial of a sailor's rum ration was preferable to incarceration for a minor misdeed. A good officer did not need to rely on punishments—a stern look or word usually sufficed. Overly harsh officers generally were dismissed. Indeed, sailors were too scarce and too valuable an asset to be abused and thrown away. Good discipline meant more than punishment. A ship in good repair and order and a crew capable of meeting its tasks were the ultimate goals. Discipline included dietary and cleanliness guidelines to reduce deaths. Sometimes captains had to force the men to eat the food they provided. The men, even those impressed, were generally well fed. Dutch sailors of the 17th century had a 4,800-calorie daily diet. Both ship and clothes had to be kept clean to reduce the chance of dysentery, typhus, and other communicable diseases. Indeed, navies fixated on cleanliness as a matter of survival.

Dominion of New England

Start Date: 1686 End Date: 1689

A governmental body established in 1686 by England's King James II to reassert royal control over the New England colonies in America. The colonies remained under its control until 1689, when the news of the Glorious Revolution reached Boston and New York and the government was promptly overthrown.

In 1676, the Lords of Trade called for an investigation into reports that Massachusetts Bay and other New England colonies were refusing to comply with the Navigation Acts. The report, authored by Edward Randolph, confirmed these violations, and the Massachusetts charter was revoked in 1684. It thus became a royal colony. Other New England colonies followed suit, and in 1686 James II formed them into the Dominion of New England, appointing Sir Edmund Andros as governor. The colonies under this government included Massachusetts, Plymouth, New Hampshire, Connecticut, and Rhode Island.

As royal governor, Andros was given sweeping power and authority. All legislative assemblies were abolished and replaced by an appointed council. James II did not authorize the establishment of a representative assembly in his instructions to Andros, and as a result the only assemblies permitted were the annual town meetings for the purpose of electing local officials. Andros levied new taxes and enforced observance of the existing tax laws including the Navigation Acts and the collection of assessments from landowners who received land grants from the Crown. Andros instituted a policy of religious tolerance in the colonies and required that Anglican Church services be conducted in Puritan colonies where they were previously banned. He also oversaw military preparation in the colonies by ordering the construction of forts and the training of militia.

By 1688, Andros's actions as governor had offended many colonists. His enforcement of the Navigation Acts enraged many merchants who had previously ignored the law. Puritans who previously withheld voting rights and religious worship to Anglicans disagreed with his policy on religious tolerance. Landowners both feared the loss of their land titles and objected to the rents paid to the Crown. And throughout the dominion, colonists objected to their lack of representation in the Andros government.

In 1688, James II was forced to flee England when his pro-Catholic policies drew the ire of Parliament and the Church of England. In April 1689, his daughter Mary and her husband William of Orange became the rulers of England. When news of the Glorious Revolution reached the colonies in March 1689, the citizens of Boston rebelled. They captured Andros, Edward Randolph, and members of the Andros council and imprisoned them. By late April 1689, the dominion government had unraveled, and in 1690, Andros returned to England at the request of King William. When the dominion ended, the colonies reverted back to their prior forms of colonial government.

Dongan, Thomas, Second Earl Limerick

Born: 1634

Died: December 14, 1715

British Army officer and governor of New York (1682–1688). Thomas Dongan was born in 1634 to a prominent Irish Catholic family and joined King Charles I's army in 1647. He served the Duke of York while in exile in France during the 1650s after the English Civil War, and after the restoration of King Charles II he held different offices in Ireland and the North African colony of Tangier. In 1682, Dongan's years of service to the duke paid off when the latter appointed him governor of his North American colony, New York.

Dongan served in New York during an age of imperial consolidation. The Duke of York, who became king as James II in 1685, endeavored to create a streamlined, efficient imperial structure, and Dongan did his part to accomplish these goals. Dongan consolidated offices among his allies, curtailed the rights of towns, and imposed English legal institutions in the Dutch-majority colony. He achieved modest success, although his policies exacerbated ethnic and political tensions that remained for decades.

Perhaps Dongan's most lasting influence was in relations with the French and Native Americans. His predecessor, Sir Edmund Andros, had formalized the Covenant Chain alliance with the Iroquois Confederation, and Dongan attempted to use this to strengthen England's hold on the North American interior. He referred to the natives not as allies but as subjects, and he claimed that all Iroquois lands rightfully belonged to the English Crown.

Indeed, Dongan proved willing to use force to defend these claims. In 1687, the French governor of Canada, Jacques-René de Brisay de Denonville, led a military assault against the Senecas, the

westernmost tribe of the Five Nations. Dongan responded by claiming that the French had encroached on English territory and gathering in Albany a force from the colony's militia to intimidate the French. Although the troops never saw action, their recruitment represented Dongan's most lasting legacy, as future governors followed his lead both in claiming Iroquois lands for the king and backing up those claims, if need be, with force.

Dongan's fortunes changed after the Glorious Revolution of 1688–1689 removed James II from power, as his Catholicism and ties to the old monarch made him a target of considerable suspicion. He left New York under duress in 1690, fleeing first to Boston and then eventually to London. Although he subsequently inherited several family titles, he never regained the prominent position he enjoyed under the Stuarts. Dongan died in London on December 14, 1715.

Dover, New Hampshire, Attack on

Start Date: June 27, 1689 End Date: June 28, 1689

Pennacook Native American attack on the English settlement of Dover, New Hampshire, on June 27–28, 1689. Relations between New Hampshire colonists and their Native American neighbors had been generally satisfactory in the 17th century; indeed, peace had been maintained until the final stages of King Philip's War.

In the autumn of 1676, many New Hampshire natives had accepted Major Richard Waldron's invitation to a meeting at his home in Dover. Waldron had been conducting considerable trade with the Native Americans, all the while earning a reputation as an unsavory and unscrupulous businessman. The natives were accompanied by several tribal leaders who had fought alongside King Philip (Metacom). A detachment of Massachusetts soldiers, who had stopped in Dover on their way to Maine to subdue some of King Philip's supporters there, quickly recognized King Philip's entourage. At Waldron's suggestion, the natives agreed to participate in a mock battle with the colonists, during the course of which the Massachusetts troops captured most of the native warriors. King Philip's supporters were kept as prisoners and the New Hampshire warriors were released.

The natives considered Waldron's role in the affair a serious breach of trust, and they retaliated with attacks on New Hampshire settlements. Hostilities ended with the signing of a peace treaty in 1678, but the Native Americans remained distrustful of the colonists. Indeed, their belief that Waldron was cheating them in the fur trade by using false weights further strained relations, especially since they had to sell land to pay their debts to the traders. Furthermore, the Native Americans suspected the New England governments of trying to incite the Mohawks to attack them.

Despite these strains, Pennacook sachem (chief) Passaconaway and his successor Wonalancet urged a policy of accommodation, and the smaller tribes followed their lead. By 1685, however, Kancamagus had succeeded his aged uncle Wonalancet as sachem of the Pennacooks. Unlike his predecessors, Kancamagus refused to tolerate further abuses from the colonists. He therefore urged the Ossipees and other tribes to unite with the Pennacooks to strike back at the English.

Kancamagus finally made his attack on the night of June 27, 1689, targeting the settlement at Dover (or Cocheco, as the natives knew it), home of the despised Waldron. Although friendly natives warned colonial officials of the impending attack, a message dispatched to Dover did not arrive in time. That evening, several Native American women arrived at the town and announced that others were on their way to trade. The women secured lodging in four of

the town's five palisaded garrison houses. After the colonists were asleep, the women opened the doors and gates of three houses, enabling the warriors, who had gathered outside, to enter. At the fourth garrison, a young man awoke and managed to bar the door.

Kancamagus's men killed Waldron, his trading partner Richard Otis, and several other occupants of Waldron's and Otis's garrisons. Altogether, 23 colonists were slain and 29 others carried off as prisoners. Because the natives apparently held no animosity toward most of the colonists, they allowed many of their captives to escape. The raiding party burned a total of six houses and a mill before withdrawing in the early morning of June 28.

A party of colonists pursued the raiders but failed to catch them. During the next several years, however, troops from New Hampshire and Massachusetts hunted down the Pennacooks and their allies, until the surviving natives finally took refuge with the French in Canada.

Drake, Sir Francis

Born: ca. 1540

Died: January 28, 1596

English admiral, privateer, navigator, and politician. Drake was also the first Englishman to circumnavigate the globe. Born sometime around 1540 in Tavistock, Devon, in England, Francis Drake went to sea at age 13 and became a ship master at age 20. At about 23, Drake entered the service of his cousin, Sir John Hawkins, who was involved in purchasing slaves in Africa for English trade goods and then selling the slaves in the New World. Drake soon developed a great dislike for the Spanish because of their Catholicism and mistrust of foreigners, but also for a supposed surprise attack made by the Spanish on San Juan de Ulúa following an agreed-upon truce. The attack nearly cost Drake his life. From that point on, he actively preyed on Spanish ships on the high seas. The Spanish counted him a pirate; the English considered him a privateer.

In March 1573, Drake and a force of Englishmen, French adventurers, and escaped Spanish African slaves sailed to Panama in two ships and there captured the Spanish treasure train at Nombre de Dios. Drake made off with a fortune in precious metals. While in Panama, Drake climbed a high tree, becoming the first Englishman to see the Pacific Ocean. Drake and the Englishmen with him returned to England rich men and heroes; he had already won the favor of Queen Elizabeth I. Drake then served the Crown, fighting in Ireland during 1573–1576.

English politician, privateersman, and explorer Sir Francis Drake, who circumnavigated the globe during 1577–1580. (Library of Congress)

In December 1577, Drake set sail from Portsmouth with five ships on orders from Queen Elizabeth to undertake a voyage against the Spanish along the Pacific Coast of the Americas. After crossing the Atlantic, Drake subdued a plot against him and abandoned two of the vessels. The remaining three ships sailed into the Strait of Magellan in August 1578 and then into the Pacific Ocean. The passage through the Strait of Magellan was difficult. Violent storms destroyed one of his ships, and the third returned to England. Drake continued on alone in his flagship, the *Golden Hind*.

Drake then proceeded north, securing vital charts from captured Spanish ships and plundering such Pacific Spanish ports as Valparaiso. Off Callao, the port of Lima, Drake took the Spanish ship *Nuestra Señora de la Concepción* bound to Panama with the annual shipment of precious metals. Continuing north, he wintered in the area of San Francisco Bay and may have reached as far north as present-day Washington State. Unable to locate the fabled Northwest Passage, he decided to strike west across the Pacific. In the process of his circumnavigation of the globe, he stopped in Manila, Ternate, and Java, arriving back in Plymouth in September 1580 with the Spanish treasure and spices. The queen's share of half the proceeds doubled the annual revenue to the Crown for that year. Elizabeth knighted Drake, at the same time insisting that all information about the voyage remain a state secret on pain of death.

Drake's great wealth allowed him to buy an estate and to become mayor of Plymouth in 1581. Recalled to the Crown's service, Drake in 1585 commanded a large fleet that sailed to the West Indies, then sacked Santo Domingo and Cartagena. Drake then captured San Augustin (St. Augustine) in Spanish Florida. He collected

tobacco and destitute Roanoke Colony survivors before returning to England.

Drake played a vital role in preventing a Spanish invasion of England. With King Philip II of Spain assembling a large force, Drake led an English force to Cádiz and occupied that Spanish port for three days, destroying 31 Spanish ships and capturing 7. He also destroyed vital stores, including a large stockpile of seasoned barrel staves to make casks to hold provisions, thus condemning the Spanish expeditionary force to rotting food supplies. His raid also set back the Spanish invasion by a year.

Drake was vice admiral of the English fleet (under Lord Howard of Effingham) in the battle with the Spanish Armada in the English Channel in July 1588. He then undertook expeditions to Portugal and the Caribbean. During an unsuccessful voyage to the Caribbean in which he tried but failed to take San Juan Puerto Rico, he succumbed to dysentery and died on January 28, 1596. Drake was buried at sea, off Portobello.

Dry Docks

Watertight basins in which ships can be docked for repair, examination, or cleaning below the ship's waterline. The two varieties of dry docks are the "graving dock" and the "floating dry dock." A graving dock is built into the ground. After a ship enters the basin, a gate or caisson (floating gate) is sealed and the water within the basin is drained or pumped away. In early dry docks, the ship would enter during high tide and the water would drain as the tide receded. The gate would then be sealed. A floating dry dock is a shiplike structure that can be sunk and then raised under a ship. Dry docks were critically important to both merchant and naval interests. Wooden ships, especially, require constant maintenance, including the removal of barnacles and wood-boring marine mollusks known as shipworms.

The earliest dry docks date from antiquity. Renaissance-era Europe introduced the open masonry basin erected below water level with the aid of cofferdams. The first such dry dock in England was constructed in Portsmouth in 1496 on the orders of King Henry VII. It was a wood and stone structure enclosed by walls of wood, stone, and earth. Subsequent dry docks were often made of stone, although heavy timber framing was also an option. The first floating dry dock dates from 1785 or earlier and may have been constructed from parts of large ship hulls.

Dry docks were not prevalent in colonial America, however. In fact, there were no dry docks in the United States before 1815. Rather, careening was the normal process for routine cleaning and other maintenance below the waterline. In careening, a ship would be pulled over with ropes ("careened") at low tide to expose one side at a time. All the major colonial ports kept careening wharves for the use of merchantmen and Royal Navy vessels. The Royal Navy also had them in Jamaica and Antigua in the Caribbean.

Dudley, Joseph

Born: September 23, 1647 Died: April 2, 1720

British colonial government official, military officer, and governor of Massachusetts (1702–1715) during Queen Anne's War. The son of Massachusetts governor Thomas Dudley and Catherine Hackburn, Joseph Dudley was born in Roxbury, Massachusetts, on September 23, 1647. He graduated from Harvard College in 1665, represented Roxbury in the Massachusetts General Court during 1673–1676, and served with provincial forces in King Philip's War (1675–1676). Afterward, he held various provincial offices until 1685, when King James II appointed him president of the council created to govern Massachusetts and New Hampshire. In 1686, Sir Edmund Andros succeeded him as council president, although Dudley continued to serve as a councilor.

The New Englanders ousted Andros in 1689 amid the turmoil associated with the Glorious Revolution in America, and Dudley spent 10 months in prison for his support of Andros. On his release, Dudley went to England, rehabilitated his political career, then returned to North America and served briefly as chief justice of New York. He was appointed governor of Massachusetts in April 1702.

As governor, Dudley almost immediately had to face the crisis brought on by the outbreak of Queen Anne's War (1702–1713). French and Native American raiding parties from Canada and Acadia attacked the province's western frontier as well as settlements

in what is now Maine; the most devastating raid was made against Deerfield on the night of February 29, 1704. Dudley responded by sending provincial militia to strike the French at Minas and Beaubassin in Acadia during the following summer. The success of this expedition helped to secure the frontier, and in 1706 Dudley secured the release of the remaining Deerfield captives. However, he failed in two efforts to capture Port Royal, from which French privateers harassed colonial shipping. The town finally fell to a combined British and colonial assault in October 1710.

Dudley's political patrons lost power when Queen Anne died in 1714, resulting in Samuel Shute replacing him as governor in 1715. Dudley died in Roxbury, Massachusetts, on April 2, 1720.

Dumas, Jean-Daniel

Born: February 24, 1721 Died: August 2, 1794

French officer in the colonial regular troops (troupes de la marine) of Canada. Born on February 24, 1721, at Montauban (Tarn-et-Garonne), France, Jean-Daniel Dumas had a successful career in the French Army during the War of the Austrian Succession before immigrating to Canada in 1750. Rather surprising for a recent arrival from metropolitan France, Dumas proved to be a natural leader of irregular troops, both Native Americans and Canadian militiamen. This became evident at the time of his first assignment in Canada, to Acadia (present-day Nova Scotia, New Brunswick, and Prince Edward Island), where his ability to forge alliances with the native peoples (the Abenakis) attracted official attention. This may explain his subsequent posting to Fort Duquesne (Pittsburgh) in the Ohio River Valley in 1754. Expecting a British attack on the strategically placed fort, its commander, Captain Daniel Liénard de Beaujeu, was scrambling feverishly to round up support among local tribes.

Dumas's great moment in the New World came on July 9, 1755, during the Battle of the Monongahela, when he found himself in command of the greatly outnumbered French and Native American force following the death of its leader, Captain Beaujeu. His role in the subsequent victory over Major General Edward Braddock's Anglo-American army earned him command of Fort Duquesne and, the next year, a knighthood in the Order of Saint Louis.

Promoted to major, Dumas served as adjutant in the army of Major General Louis-Joseph, Marquis de Montcalm, at the siege of Fort William Henry, where he distinguished himself as commander of the Canadian militia. Made adjutant general and inspector of the troupes de la marine on January 1, 1759, Dumas went on to command a brigade under Montcalm at the Battle of the Plains of Abraham on September 13 of that year and again under Brigadier General François Gaston de Lévis at the Battle of Sainte Foy on April 28, 1760. When plans to recapture Quebec after the French victory at Sainte Foy fell through, Dumas was placed in charge of a last gasp effort to block the advance of British Brigadier General James Murray's army on Montreal. Dumas returned to France after the fall of Canada to the British.

Back in France and promoted to colonel, Dumas was made governor of the Île de France (Mauritius) and the Île de Bourbon (Réunion) in the Indian Ocean in 1766. Returning to France once again in 1768, he retired with the rank of brigadier general. In 1773, Dumas published a highly regarded study titled *Traité de la Défense et de la Conservation des Colonies* (Treatise on the Defense and Preservation of the Colonies). He died a major general of the French Army at Albias (Tarn-et-Garonne), France, on August 2, 1794.

Dummer's Treaty

Event Date: 1727

Peace treaty formally ending hostilities in the five-year Dummer's War (1722-1727). The treaty was signed between Massachusetts officials and local Native Americans and was named for Massachusetts acting governor William Dummer. Armed conflict began in 1722 with Native American (mainly Abenaki) raids on English settlements in Maine (then part of Massachusetts Bay Colony). In 1723, the English struck back, beginning in Casco Bay. As in many other areas of North America, relations between English colonists and Native Americans had steadily deteriorated as a result of increasing land encroachments by white settlers. In 1723, a group of Penobscots murdered five white settlers including a military captain. When news of the massacre reached Boston, the colonial government decided to retaliate. In 1724, in a series of raids, the local militia destroyed numerous indigenous villages. The natives responded in equally violent fashion. In late 1724, after suffering heavy losses, the two sides agreed to begin discussions for a peace treaty.

Although active negotiations began in 1725, Dummer's Treaty was not signed until 1727, as Governor Dummer had sought an agreement mainly on his terms, which greatly complicated the negotiating process. It was probably the most important treaty between Native Americans of Maine and the Maritime Provinces with the colony of Massachusetts. The chief representative for the Native Americans was Chief Sauguaaram (also known as Loron). The treaty ended all hostilities but also affirmed the existence of the Abenakis' original land titles. The natives also received promise of a Catholic priest missionary as well as fishing, hunting, and land-use rights in perpetuity. Dummer's Treaty became a model for subsequent treaties between the English and Native Americans.

Dummer's War

Start Date: July 25, 1722

End Date: 1727

War between English colonists and various Native American groups, primarily the Abenakis, in New England. The 1713 Treaty of Utrecht ending the War of Spanish Succession, known in America as Queen Anne's War (1702-1713) and the Treaty of Portsmouth (1713) ending its North American component, had put a halt to most violence in northern New England; however, the roots of further conflict continued to grow during 1713-1722. No longer threatened by native attacks, New England settlers and traders once again expanded into the northern and eastern frontiers of the region, intruding on Abenaki lands and disrupting their lives. Religion furthered the divide between natives and the English as Jesuit priests such as Sébastien Râle at Norridgewock continued to proselytize among the Abenakis. Largely dependent on English trade goods, the natives restrained their anger until Massachusetts attempted to arrest Râle in the winter of 1722 and plunder his church.

The Abenakis responded to English encroachments with open insolence and property destruction, causing many English families to flee exposed areas. Hoping to coerce the natives into a settlement, the Massachusetts legislature halted all trade with the Abenakis in September 1721. Instead, the next summer the Abenakis raided the lower settlements of the Kennebec River near Brunswick, where they burned homes and took more than 60 captives (most of whom they later released), but avoided indiscriminate bloodshed. On July 25, 1722, Gov. Samuel Shute of Massachusetts denounced the eastern natives as rebels, essentially declaring war. Shute soon left for England, leaving the conduct of the war to Lt. Gov. William Dummer, who served as acting governor and for whom the conflict was named.

Native American raiding parties struck all across northern New England, engulfing Maine, New Hampshire, and western Massachusetts in war once more. New England went on the offensive in 1723, burning the Penobscot village of Panawanske (Old Town) in February. Convinced that Râle was inciting the natives to violence, New England determined to stamp out his influence for good. After unsuccessful winter expeditions in 1723 and 1724, captains Johnson Harmon and Jeremiah Moulton led forces up the Kennebec River in August 1724. Undetected, the New England forces attacked Norridgewock, killing Râle and several Abenaki leaders and burning the village. The Abenakis were less aggressive following this defeat.

In addition to organized expeditions, British colonial governments encouraged private actions against hostile natives by offering an extraordinarily high bounty of £100 for each scalp of male Abenakis over 12 years of age. Private citizens organized and equipped armed companies, essentially business ventures, to range

against the natives in hopes of gathering scalps and sharing the profits. Captain John Lovewell led one such company toward Pigwacket, where on May 8, 1725, his party was mauled by native warriors. The company lost nearly a third of its men, including Lovewell.

Peace negotiations eventually followed, but Governor Dummer wanted peace on his terms, and had difficulty obtaining agreement among the various Abenaki bands. Androscoggins, Kennebecs, and Canadian mission Native Americans continued sporadic raids on eastern frontier settlements into 1726. A formal peace was declared with Dummer's Treaty in 1727.

Fighting continued, however, in western New England in 1727, where the war was known as Grey Lock's War. Grey Lock, a Western Abenaki leader and possible refugee from King Philip's War (1675–1676), led numerous raids against English settlements in the Connecticut River Valley. He ignored repeated efforts by New York, the Iroquois, and the Penobscots to end the war. However, once the Eastern Abenakis had come to terms with the English, Grey Lock ended his war, but without signing a peace agreement.

Peace was followed by another spurt of English expansion, as the Massachusetts government approved the creation of a series of new townships across northern New England to create a buffer against northern and eastern natives, satisfy the land demands of veterans of King Philip's and King William's wars, and strengthen its claims to the region.

Following Dummer's War, the Massachusetts government took greater control of the Indian trade, establishing three truck houses in frontier regions as the only sanctioned locations for trade with the natives. Also as a result of aggressive English actions against Abenaki villages, the Abenakis dispersed north and eastward in small groups, many moving to Canada.

Dunmore's War

See Lord Dunmore's War

Duquesne de Menneville, Ange, Marquis de Duquesne

Born: 1702

Died: September 17, 1778

French naval officer and governor-general of New France (1752–1755). Born into a distinguished maritime family in Toulon, France, in 1702, Ange Duquesne de Menneville, Marquis de Duquesne, was a grand nephew of the celebrated French mariner Abraham Duquesne. He entered the Royal Marines at a young age and rose through the ranks of the French Navy, ultimately attaining the rank of rear admiral. He also served as commandant of his hometown port.

In 1752, Duquesne arrived in Canada as an unexpected choice to direct colonial policy in New France. Imperious and largely devoid of subtlety and introspection, he soon alienated Canadians and Native American allies alike. Duquesne immediately confronted the challenge of consolidating the French presence in the Ohio River Valley while preventing British encroachment in this lucrative territory.

Duquesne subjected the Canadian militia to a grueling training regimen that reflected his dim view of colonial military capabilities. He then launched missions to construct four forts in the Ohio Country regardless of what proved to be a daunting expense in money and lives. The site of the final post, Fort Duquesne, coincided with the spot selected by the Ohio Company for a British trading post at the junction of the Allegheny River and Monongahela River.

In 1754, a British expedition commanded by Lieutenant Colonel George Washington surrendered to the French at Washington's hastily erected Fort Necessity, following hostilities that had precipitated the beginning of the French and Indian War (1754–1763). Aware that his administration had raised grave doubts about the financial solvency and defensibility of New France, Duquesne deemed this a prudent time to return to naval service. His haughty dealings with native allies in the Great Lakes region (known as the Pays d'en Haut) had rendered the Ohio Country forts dangerously overextended without effective indigenous support. Although the French and Indian War opened with serious setbacks for the British, Duquesne's performance would be progressively discredited as the conflict unfolded. In 1755, he requested his own recall and sailed for France.

Duquesne's subsequent naval service was unspectacular. Given command of five ships of the line and a frigate and ordered to join French ships blockaded at Cartagena and help them break free, he succeeded in getting into that port only two of his ships of the line. On February 28, off Cape de Gata, British ships under Admiral Henry Osborn sighted the other French ships and gave chase. Only the French frigate escaped. The three remaining ships of the line, including Duquesne's flagship, the 84-gun *Foudroyant*, were forced to surrender and another ship was driven ashore. Duquesne was among the French taken prisoner. He returned home in disrepute

and did not serve at sea again. Nevertheless, King Louis XV pardoned this most obedient lieutenant and provided him with stipends and honorary titles until Duquesne's death on September 17, 1778, in Antony, France.

Duston, Hannah

Born: December 1657

Died: 1730

Settler of Haverhill, Massachusetts, captured by Native Americans during King William's War (1689–1897), and celebrated for her killing of nine of her captors. Born in Haverhill, Massachusetts, in December 1657, Hannah Emerson married Thomas Duston, a farmer from Dover, New Hampshire, in 1677, with whom she had eight children. The family resided in Haverhill.

When Haverhill was raided by natives on March 15, 1697, Duston had just given birth to her eighth surviving child. Thomas Duston and their other children were away from the house when the attack began and found shelter in a nearby garrison. However, Hannah and her nurse, Mary Neff, were quickly captured and the infant killed.

The natives marched their captives to a small island settlement near the confluence of the Contoocook River and Merrimack River, just upriver from present-day Concord, New Hampshire. Duston, Neff, and Samuel Lennardson, a young English boy captured at Worcester eight months previously, were held by an extended native family of two men, three women, and seven children.

Informed of the long march to Canada and the gauntlet they would face at its conclusion, the 3 captives contrived to escape. Lennardson convinced 1 warrior to explain how to kill and scalp a person. On the night of March 30, 1697, as the natives slept, Duston and Lennardson killed and scalped 10 of their captors and returned to Haverhill. On April 21, Duston and her husband presented the scalps to the Massachusetts General Court, petitioning for the appropriate scalp bounty. Thomas Duston received £25 on behalf of his wife. Neff and Lennardson received half that amount, although Duston reportedly killed 9 of the 10 natives herself. Duston's deeds were celebrated throughout New England, most notably by Cotton Mather in his *Magnalia Christi Americana*, and she thus

became a frontier legend. Duston survived her husband and died sometime in 1730.

Dutch-Indian Wars

Start Date: September 1, 1641 End Date: May 16, 1664

Persistent animosity resulted in a series of conflicts between European settlers in New Netherland and neighboring Algonquian tribes. Tensions flared into four periods of open warfare: Kieft's War (1639–1645), the Peach War (1655), the First Esopus War (1659–1660), and the Second Esopus War (1663–1664).

Residents of New Netherland carried on a profitable fur trade with the Iroquoian Mohawk people of the upper Hudson River Valley. But they increasingly viewed the Algonquian people—the Hackensacks, Raritans, and Wecquaesgeeks, among others—of the lower Hudson as an obstacle to the colony's expansion. Director General Willem Kieft had purchased from the Algonquins several large tracts of land around New Amsterdam. The Dutch population quickly moved onto the tracts and established farms. The European practice of fencing fields and letting livestock roam clashed, however, with the natives' open-field agriculture. When European hogs and cattle damaged native crops, the Native Americans retaliated by killing and eating the livestock.

Kieft aggravated the growing native hostility by ordering the tribes to pay a tribute to the colonial government. Indeed, Kieft sent a boat to collect the tribute from the riverside native villages. At one village, in early 1640, the crew began loading furs without permission and sparked an armed skirmish. Shortly thereafter, Kieft received word of Raritans killing hogs belonging to a Dutch planter on Staten Island, although in fact Dutch seamen were the culprits. On July 16, 1640, Kieft sent a punitive expedition of some 70 soldiers and sailors against a band of Raritans near Staten Island. Their orders were to demand satisfaction and, if that was not forthcoming, to destroy the Raritans' corn crop and take prisoners. During the expedition, Dutch commander Cornelis Van Tienhoven walked away rather than restrain his men, and the troops immediately began to kill Raritans.

Kieft mistakenly believed that his attack would subdue the Raritans, but it only enraged them. Although conflicting reports

obscure whether a particular incident triggered Kieft's War, a picture emerges of a cycle of murder and revenge, some of it fueled by alcohol, the colonists' main stock in trade. On September 1, 1641, the Raritans retaliated for the July 1640 expedition, killing four Dutch men and burning several houses on Staten Island. Kieft then called for the other tribes to turn on the Raritans. Enough of them did so that the Raritans sued for peace by the end of the year.

In the meantime, in August 1641 a Wecquaesgeek man had robbed and murdered a Dutch craftsman, claiming that he was avenging the long-ago murder of his uncle by Dutch traders. Kieft demanded, without result, that the killer be turned over to him for punishment. The end of hostilities with the Raritans freed Kieft to seek redress from the Wecquaesgeeks. He mounted an expedition against them in March 1642, but the soldiers failed to find the native encampment.

Frightened by how near they had come to being attacked, the Wecquaesgeeks sued for peace. They promised to turn over the fugitive, but never did. In the summer of 1642, the son of a Hackensack sachem, while drunk, shot and killed a Dutch man at work on a Staten Island farm, then fled the area. Again Kieft demanded custody of the fugitive, to no avail.

In February 1643, Kieft decided that the time had come to mount an attack so brutal that it would end all native resistance. He chose two targets: an encampment at Pavonia where several hundred Tappan and Wecquaesgeek people had taken refuge after an attack by the Mohawks, and an encampment of Hackensacks on Manhattan Island. On the night of February 25, 1643, Kieft ordered his militia to massacre the refugees. Eighty Dutch soldiers torched the Pavonia encampment as their victims slept and killed some 80 defenseless men, women, and children. Some 50 volunteers attacked the refugees on Manhattan, killing another 40 of them.

Kieft's massacre ignited a general Indian uprising against colonial settlements—both Dutch and English—throughout New Netherland. Eleven tribes mounted ambushes on the colony's farms and settlements, and the colonists fled to the New Amsterdam fortifications. Many Dutch families desperately sought passage back to the Netherlands. In late April 1643, the tribes accepted the terms of a peace treaty. However, Kieft insulted the sachems by giving them only the bare minimum of the expected gifts.

The young men of the tribes agitated for a return to war, and violent incidents proliferated. In August 1643, the Wappinger tribe began attacking trading vessels on the Hudson. The violence quickly escalated, and within a month 1,500 warriors from seven tribes attacked and occupied much of Manhattan.

Kieft then hired John Underhill, the New England officer who had taken part in the 1637 massacre of the Pequots, to lead a militia force of some 40 English volunteers. Underhill's troops joined with Dutch militia and swept through the countryside, killing more than 100 Native Americans and mutilating several prisoners. A third of the war's native casualties occurred on one night in February 1644. In an action similar to that of the Pequot massacre, Underhill led a 130-man force in the slaughter of more than 500

Illustration showing New Netherland governor Willem Kieft leading a massacre of Mohawk Native Americans during the 1640s. Warfare in the region was in large part caused by the harsh Dutch treatment of the natives. (North Wind Picture Archives)

Wecquaesgeeks and Wappingers in present-day Westchester County, New York, setting fire to their village and killing them as they fled.

Some of the Algonquian tribes sued for peace in April 1645, and by August all parties had signed a treaty. Kieft's War ended with more than 1,500 Algonquians killed, and the countryside virtually emptied of Dutch settlers. The thinning of both populations reduced the opportunities for conflict. However, colonists complained bitterly about Kieft's incompetence, some calling him too bellicose and others saying he failed to prosecute the war with sufficient vigor. Their complaints spurred the West India Company to replace him with Petrus Stuyvesant, who arrived in May 1647. Euro-

pean immigration surged, and once again natives and colonists struggled for control of the land. Isolated killings occurred, but unlike his predecessor, Stuyvesant showed restraint.

The so-called Peach War began in 1655 with the murder of a native woman as she picked peaches from a colonist's trees. Nearly 2,000 Mahican, Esopus, and Hackensack people had come down the river to invade an enemy people, the Canarsies of Long Island. Camped on Manhattan, they foraged for food, and a hot-tempered Dutch land owner shot the woman in his orchard. To avenge her death, on September 15 hundreds of warriors invaded Manhattan Island, Staten Island, and Long Island. During a three-day rampage they burned farms and orchards and captured nearly 100 women

and children. The attack took place while Stuyvesant was absent in Delaware, subjugating the Swedish. On Stuyvesant's hurried return, colonial forces retaliated against native villages and farms, although peace negotiations began in October. Although the combatants did not bring the war to a formal conclusion, hostilities ceased and the Native Americans began ransoming their prisoners. The episode caused the deaths of some 50 colonists and 60 Native Americans, the loss of some 500 cattle, and the destruction of 28 farms.

Stuyvesant began instructing his colonists to live together in defensible villages rather than on their scattered farms. The settlers, however, preferred to live independently and thus remained isolated and vulnerable to attack. They also gave the natives brandy in exchange for furs. Young men of the Esopus tribe, fueled by brandy, harassed colonists around the village of Esopus, a Dutch settlement between New Amsterdam and Fort Orange. Stuyvesant visited Esopus in 1657 and sternly admonished both settlers and natives to refrain from liquor trafficking. He insisted on the fortification of Esopus and stayed long enough to see it accomplished. The situation returned to a semblance of tranquility, but resentment simmered on both sides.

On September 20, 1659, a colonist gave 8 Native Americans brandy in payment for harvesting his corn. They proceeded to have a loud party just outside of Esopus. Several settlers then attacked them after they had fallen asleep and killed 10f the men. The next day, some 500 Native Americans avenged the murder by destroying the settlers' crops, killing livestock, and burning barns. The Esopus and Wappinger peoples attacked colonists' farms and villages along the Hudson River and lay siege to Esopus for 23 days. Stuyvesant raised an army of some 300 men and came to its aid on October 10, but the natives had already abandoned the siege. After a quiet winter, Stuyvesant and his force again sailed north in March 1660 to finish the war. After a series of skirmishes and the killing of the eldest Esopus chief, the combatants signed a treaty in July 1660.

Still resentful that Stuyvesant had deported 11 captives to slavery in the West Indies during the previous war, the Esopus began a new series of attacks on June 7, 1663. They massacred the inhabitants of Wiltwyck (formerly Esopus), including women and children, leaving more than 20 dead and taking nearly 50 prisoners. Calling for volunteers among the panic-stricken populace, Stuyvesant was able to assemble only 150 men, 80 of whom were mercenaries. Their capable leader, Martin Cregier, received a description of the terrain from a woman who had escaped from her captors. On September 3, Cregier led a successful expedition from Wiltwyck, killed some 30 of the Native Americans, and recovered a number of prisoners.

The remnants of the Esopus continued to harass the settlers until a second expedition in October destroyed what was left of their crops. The surviving Esopus took refuge with the Wappingers, and the two tribes planned a joint attack but lacked the resources to carry it out. Instead, they sued for peace near the end of 1663. Distracted by the growing English threat, Stuyvesant accepted their

offer. A treaty concluded on May 16, 1664, divested the Esopus of all their land near Wiltwyck.

Dutch-Mohawk Treaty

Event Date: 1643

Treaty of alliance between the Mohawks and the Dutch colonists of New Netherland. Both the Mohawks and Dutch settlers in New Netherland came under increasing pressure in the early 1640s from their Native American neighbors and other European colonial powers. France was expanding its settlements in Canada, and the French, together with their Algonquin and Huron allies, posed a significant military threat to the Mohawks. But the more immediate danger came from the French-allied natives' challenge to Mohawk dominance of the regional fur trade.

Dutch claims to the territory along the Connecticut River were jeopardized by the growing number of New Englanders settling in the area. At the same time, tensions with New Netherland's neighbors had led to a series of conflicts called Kieft's War (1639–1645), named after the colony's governor, Willem Kieft.

In these circumstances, the Dutch and the Mohawks recognized the benefits of an alliance. Building on earlier treaties of friendship that Dutch traders at Fort Orange (now Albany) and the Mohawks had made, Kieft entered into negotiations to formalize the relationship between the Mohawks and the colonial government. The actual treaty has not been found, although references to it elsewhere give some information regarding its terms.

The treaty was apparently an economic agreement as well as a political alliance. The Dutch affirmed the Mohawks' position as intermediaries in the fur trade with New Netherland, and provided firearms with which the Mohawks could oppose the efforts of the pro-French tribes to gain a larger share of the trade and direct it to New France. The Mohawks agreed in turn to serve as intermediaries for the Dutch in the colonists' disputes with other natives in

180 Dutch-Mohawk Treaty

the area; they later played a crucial role in bringing the Esopus tribe to negotiate with the Dutch during the Esopus Wars (1659–1660 and 1663–1664). The Dutch-Mohawk Treaty remained in effect to the benefit of both parties until the English capture of New Netherland in 1664. The English then followed in he footsteps of the Dutch and formed their own alliance with the Mohawks.

Easton Conference and Treaty

Event Date: October 26, 1758

Meeting of various Native American groups, Pennsylvania representatives, and British royal officials held at Easton, Pennsylvania, from October 11 to 26, 1758, sometimes referred to as the Easton Congress. The Easton Conference was the largest meeting of its kind in the colony's history. The congress and resulting treaty came about at the height of the French and Indian War (1754–1763) and thus must be viewed within the context of that conflict. The 1758 meeting was actually the culmination of a series of conferences held at the same location beginning in 1756. The negotiations involved a variety of groups, often with competing interests.

For the British, the key issue at the time was their desire to assure the support of the Iroquois and Ohio-area tribes, or at least to guarantee their neutrality in the British war effort against the French. The outcome of the negotiations at Easton held special importance for Brigadier General John Forbes, whose campaign against the French at Fort Duquesne hung in the balance. George Croghan was the chief representative of the British government. In addition, several groups represented various Pennsylvania interests at the congress. On the Native American side, the Iroquois Confederacy, the Delawares, the Shawnees, and others were represented. Altogether, there were some 500 Native American representatives from 13 nations present at Easton.

The various indigenous groups sought a redress of grievances stemming from previous land agreements, most notably the Walk-

ing Purchase. Likewise, there existed internal divisions among the natives as the Iroquois sought to reimpose their hegemony over various tribes they considered dependent, such as the Delawares. Teedyuscung, the Delaware chief, who played a significant role in the two previous Easton conferences, thus had his prestige undercut by the representatives of the Iroquois Confederacy.

The atmosphere at the conference was tense and confused from the start, with Teedyuscung frequently drunk and then ignored by the other tribal leaders in their private councils. The meeting ended on October 26 with the promise by British officials to look into the various native claims of mistreatment in land dealings. Further, the British promised to keep land beyond the Appalachian Mountains free from white settlement. This pronouncement was key in that it allowed the Iroquois to use their considerable influence with the Ohio tribes to keep them neutral.

The British pledge cleared the way for Forbes to advance on Fort Duquesne and the subsequent French abandonment of that post. On the Native American side, the Iroquois succeeded in reasserting their hegemony at the cost of Teedyuscung's reputation. Likewise, they believed they had achieved a clear guarantee of protection from the British crown for the lands beyond the Appalachians.

Ecuyer, Simeon

Born: Unknown Died: Unknown

Swiss-born soldier in the Royal Americans and commander of Fort Pitt (1761–1763), best known for employing a crude form of germ warfare against the Delawares during Pontiac's Rebellion. No reliable birth information is available for Ecuyer, and his early years are shrouded in obscurity.

Ecuyer entered the historical record at the end of the French and Indian War (1754–1763). Beginning in 1761, Ecuyer, a captain, took command of Fort Pitt (present-day Pittsburgh). The Fort had sustained repeated attacks and siege attempts before the British finally defeated the French and peace was declared in 1763. As soon as the French and Indian War ended, another conflict flared, this one between the British and Native American tribes in the Ohio Valley, Great Lakes, and frontier areas of the established colonies.

The renewed warfare was instigated by the Ottawa chief Pontiac. He and other native leaders believed they had just cause for rebellion, including new policies instituted by the British commander in chief in North America, Major General Jeffery Amherst, which included an end to the French practices of gift giving, a staple of Native American diplomacy. In the spring of 1763, in what became known as Pontiac's Rebellion or Pontiac's War, local natives laid siege to Fort Pitt, burning homes as they advanced. The attacks forced dozens of frightened, homeless colonists into the confines of the fort. Realizing that the post was now terribly overcrowded, the warriors laid siege to it, allowing no one to enter or exit. In May or June 1763, Captain Ecuyer informed Colonel Henry Bouquet that he feared an outbreak of disease because of the conditions. Indeed, right after the letter was sent, smallpox broke out within the fort. Ecuyer quarantined those affected and stubbornly refused to capitulate to the besiegers.

On June 24, 1763, according to the journal of the trader William Trent, two native chiefs entered Fort Pitt to convince Ecuyer to give up the fight. He refused, but he did present them with two blankets and a handkerchief. All three articles had come from the smallpox victims.

Historians are still in disagreement over who actually hatched the plan to infect the natives with contaminated articles. But Trent's journal leaves little doubt that it was Ecuyer who carried out the deed. In a July 1763 letter, Amherst had mentioned that the natives should be infected with smallpox, though it is unlikely that he had heard about Ecuyer's action. Whether he had mentioned this previously to Ecuyer cannot be determined, but it is obvious that he would have approved of it in any case. In a matter of several months, a smallpox epidemic swept through the native populations of the Ohio River Valley. Whether it was a result—direct or indirect—of Ecuyer's deed at Fort Pitt cannot be definitively proven.

In July 1763, a group of Shawnee and Delaware warriors assaulted Fort Pitt. Sometime during the fight and ensuing siege, Ecuyer was wounded. The garrison nevertheless fended off the attackers until Bouquet arrived with some 400 reinforcements. Bouquet took command of Fort Pitt in August 1763. Little is known of Ecuyer's remaining years, and the circumstances of his death remain obscure.

Edged Weapons

In Colonial America, edged weapons appeared in both great variety and design. Traditionally, edged weapons provided a relatively inexpensive means of conducting combat. The most common types of edged weapons in North America during the colonial period were swords, pikes, hatchets, knives, and bayonets.

In the Spanish empire, the common *espadon* (two-handed sword) of Medieval Europe eventually gave way to the lighter and more flexible rapier. The rapier possessed distinctive *quillons* (protective metal rings about the handle) and a long, thin double-edged blade. Elsewhere, rancheros and soldiers alike carried less fanciful *espadas anchas* (common swords). Although the Spanish government formally adopted a cavalry, light infantry, and dragoon sword in the 18th century, the conservative nature of Spain's bureaucracy and the need for economy required the heavy reuse and refurbishment of old swords. Most Spanish colonial swords proved ruggedly simple in design and were worn either in the belt or over the shoulder.

In Britain, the English Army relied essentially on two types of slightly curved, single-edged swords that saw widespread use in America, unofficially known as the Model 1742 and the Model 1751, respectively. However, the English were not known for their cutlery; as a consequence, many army and navy officers frequently purchased their swords from abroad. At the time, Solingen, Toledo, Valencia, and Milan produced some of the finest blades in Europe. Furthermore, neither the British Army nor the Royal Navy standardized their sword designs until after the American Revolutionary War. Consequently, the actual design and acquisition of swords often fell on individual regimental commanders and ship captains. Despite the popularity of the weapon, the French and Indian War (1754–1763) proved the relative uselessness of the sword. Although edged weapons remained the weapon of choice among cavalry,

elsewhere such pieces were fast becoming strictly ceremonial because of the growing lethality of artillery and muskets.

As with the British, the French also realized the sword's impracticality during the French and Indian War. After 1764, French infantry no longer employed swords as combat weapons, although the cavalry did retain them, as did noncommissioned officers, musicians, and grenadiers. The French did not standardize their sword design until 1767.

Colonial American swords revealed tremendous variety in both style and design. American militiamen not only used swords made in Europe and by local smiths but also made use of family heirlooms and captured pieces. In the end, no truly innovative sword designs or patterns emerged in America. As a rule, American-made swords tended to be of poorer quality than their European counterparts. However, beginning in the 18th century, the immigration of German swordsmiths—with their patterns, molds, and tools—slowly but steadily increased the viability of the craft in the British colonies.

On both sides of the Atlantic, other types of swords also existed. For example, "hunting swords" and "small swords" remained popular among the civilian population, whereas fanciful and often bejeweled "town" or "walking" swords continued to be used within diplomatic and court circles.

Another broad class of swords, the cutlass (also known as a "hanger") was a short, single-edged weapon. In the military, swords generally fell into one of two categories: foot (as a back-up weapon for infantry) and mounted (as a primary weapon for cavalry). Generally, officers' swords possessed such fineries as engraving, silver inlay, and handles made of bone or ivory.

Another popular edged weapon was the pike. A weapon ancient in design, it consisted of an iron or brass blade attached to the end of a long, thin, wooden pole. The pike went by various names, including bill, gisarme, lance, partisan, poleaxe, spontoon, halberd, and even half-pike. Although similar in design, each name suggested a slight variation in pattern. For example, a full pike measured 14-16 feet in length, whereas a half-pike came to 6-8 feet; a fauchard was a pike with spikes protruding from the dull side of the blade, and a halberd flaunted a head with a long spear point and a crescent-shaped blade. Originally introduced to the Americas by the Spanish, the pike normally served as a weapon against cavalry, to protect infantry made temporarily vulnerable when reloading their muskets. Although pikes proved effective against cavalry, they too became obsolete with the emergence of improved firearms and artillery. Also, the sheer length of pikes (up to 22 feet) rendered them impractical in North America's heavily wooded terrain. Consequently, by the end of the 17th century, Europeans and Americans alike abandoned the use of pikes as formal weapons. They were, however, retained as ceremonial pieces employed by officers and court officials.

The most commonly used polearm, however, was the hatchet. In the colonial period, the hatchet resembled the European half-axe or American felling axe. Simple in design, hatchets entailed the same fundamental construction: a short wood or iron handle with a forged iron head. The blade edge normally flared out slightly so that it was

approximately twice the width of the base of the blade. Easily repaired by camp blacksmiths, hatchets were generally preferred over bayonets because of their ruggedness and utility. The hatchet consisted of a handle (or "helve") that fit into the "eye" of the head. The blunt end of the hatchet head was the "poll," and the sharp-edged end was referred to as the "bit." One curious innovation—the pipe tomahawk—appeared in the early 1700s. It incorporated a smoking pipe into the body of the handle; a cast brass version appeared around 1750. Another (but less common) innovation was the so-called spontoon hatchet, an unwieldy weapon that used the head design of a traditional long polearm. Other designs entailed a "hammer" poll (which was just as the name suggests) and the less common (and decidedly unwieldy) "spiked" poll, which brandished a picklike extension opposite the blade. Militia laws long required soldiers to carry both a sword and a hatchet, but by the time of the American Revolutionary War, most colonies had resorted to the hatchet alone because of the latter's versatility and low cost. Eventually, both the French and British made the hatchet a standard piece of soldiers' equipment.

As with the hatchet, the knife dates to ancient antiquity (in fact, the word "knife" dates to the Anglo-Saxon *cnif*). The value of the knife traditionally lay in its simple design, ease of manufacture, and its practical use as a weapon—and a tool—for the soldier. Colonials employed a wide variety of knives. For example, soldiers used a rifle knife—with a short blade of about 3–4 inches in length—during combat to trim the excess cloth from musket-ball patches.

Daggers were more fanciful and a bit less common. Such weapons were normally finely made, double-edged knives with blades approximately six inches long and a small hand guard. They usually possessed such adornments as silver hilts and ivory grips. Generally, daggers were carried by officers.

The most common blade of all, however, was the formidable-looking "hunting" knife. Also known as the "fighting" or "scalping" knife, this particular weapon brandished a cutting edge up to 12 inches in length. Handles on knives tended to be either antler, cow horn, or wood. Like many edged weapons, however, knives lost their primacy as combat weapons with the advent of advanced muskets and artillery.

The bayonet also came into prominence during the colonial Period. The exact origins of the weapon remain unclear (the Old French word for arrow was *bayon*, and in the 17th century, "bayonet" referred to a dagger; another theory holds that the weapon was developed in the French town of Bayonne). In any case, the bayonet—a blade approximately 16 inches long attached to the muzzle of a musket—emerged in France as early as the 1640s.

Bayonets allowed a soldier protection against enemy cavalry during the dangerous lull required to reload a musket. In short, the bayonet crudely merged the pike with the musket. The original prototype of the bayonet, the plug, consisted of a blade attached to a tapered wooden handle, the latter part fitting snugly into the muzzle of the musket. Unfortunately, plug bayonets usually proved a nuisance to soldiers; not only could its handle break off inside the musket barrel, but it could be rendered useless because of the buildup of hard gunpowder residue inside the muzzle. Moreover,

184 Edwards, Jonathan

the plug bayonet also required the soldier to remove completely the entire blade each time to fire and reload.

A solution to such problems, the so-called socket bayonet, emerged in Sweden in the 1680s. By attaching the bayonet to the exterior surface of the muzzle using a hollow metal cylinder, a soldier could load and fire a musket while the bayonet was attached. By the early 18th century, the socket bayonet became standard throughout European and American armies. It would remain essentially unchanged for the next 150 years.

Edwards, Jonathan

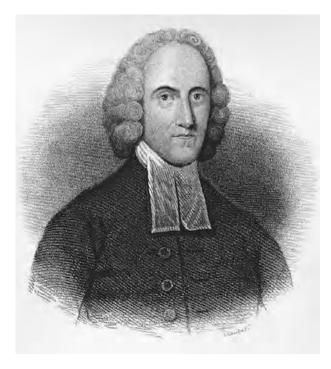

Born: October 5, 1703 Died: March 22, 1758

Leading American theologian and revivalist of the 18th century, largely responsible for spurring the Great Awakening. Jonathan Edwards was born in East Windsor, Connecticut, on October 5, 1703. He was educated in his father's church with other boys preparing for college, and from an early age he was exposed to contemporary philosophy and ideas from Europe.

When he was 12, Edwards entered Yale College and graduated at the top of his class in 1720. Before receiving his master's degree from Yale in 1723, Edwards briefly preached at a poor New York City Presbyterian church. He returned to Yale as a tutor in 1724 but left two years later to serve with his grandfather, Solomon Stoddard, the pastor of Northampton, Massachusetts.

Stoddard was a successful but domineering pastor whose preaching had accomplished several small revivals in the Connecticut River Valley. Revivals at the time referred to an outpouring of God's grace on the congregation of a church, reflected in exceptionally large numbers of new members and evidenced by improved moral conduct among the people. Stoddard died in 1729, and Edwards assumed his position. At first, Edwards's sermons were conventional, but he soon developed a distinctive style. He compared the depravity of human life with the joy of salvation by faith. He concentrated first on the young people of Northampton, whom he saw as licentious and morally challenged. Beginning in 1734, observers saw changes in the conduct of these young people, then their elders, in response to Edwards's teaching.

Visitors spread Edwards's message to neighboring communities, giving rise to the "Little Awakening." Edwards's success had

Jonathan Edwards (1703–1758) was a theologian and evangelical Congregational minister who exerted an enormous influence on the course of religion in America. (Library of Congress)

drawbacks, however. Many young people failed to resume their deferential relationship toward their parents, and other members of the congregation fell into despair at scrutinizing the faults of their souls. When Edwards's own uncle committed suicide in 1735, the movement faltered.

Edwards described his work in Faithful Narrative to the Surprising Work of God in 1737. His teachings began to concentrate more on God's wrath and justice toward sinful men. His best-known sermon, "Sinners in the Hands of an Angry God," in which he said that man earns his own damnation but a merciful God sustains him for a time, dates from this period.

In 1740, Edwards invited George Whitefield, an itinerant preacher known for sparking revivals in England and America, to visit Northampton. The resulting wave of revivals became known as the "Great Awakening." Edwards became the best known of the preachers and theologians in this movement.

Many have interpreted the movement as a response to the growing secularization of society and social tensions. For some converts, receiving the Holy Spirit's grace meant trusting in their own consciences and gaining approval for surviving in a less harmonious and more competitive society. The excitement caused by the revivalists soon caused disorder in many of the towns in which they were active. Some followers turned away from established churches and formed their own. Divisions over religious issues were common. Edwards emerged as the chief spokesman for the revivalists. His works included *Some Thoughts Concerning the Present Revival of Religion* (1742) and *Treatise Concerning Religious Affections* (1746).

Edwards was disappointed by the impermanent nature of the revivals during the Great Awakening. He demanded that no new members be admitted to his congregation who did not display outward signs of God's saving grace. He alone would judge whether someone was worthy of admission. His congregation rebelled, and Edwards was removed in 1750. He moved to Stockbridge, Massachusetts, where he ministered to Christianized Native Americans. While there, Edwards wrote *A Careful and Strict Enquiry into the Modern Prevailing Notions of Freedom of the Will* (1754). His discussion of how to define freedom marks Edwards's place in the history of ideas. In 1758, Edwards became president of the College of New Jersey (later Princeton University). He served only a month before dying there on March 22, 1758, of complications from a smallpox vaccination.

Emistisiguo

Born: ca. 1718 Died: 1782

Prominent chief of the Upper Creeks from approximately 1763 until his death in 1782. Born in what is now western Georgia about 1718, Emestisiguo rose to a prominent leadership position in the Creek Confederacy. He participated in the war against the neighboring Choctaws during 1763–1776 and took the leading diplomatic role in the Creeks' territorial dispute with Georgia in 1773–1774.

After the Creeks ceded a large amount of land to that colony in 1773, several disgruntled warriors launched attacks against colonists in these "Ceded Lands" at the beginning of 1774. The Georgians retaliated, and officials halted all trade with the Creeks. These actions threatened to spark all-out war. To resolve the dispute, Emistisiguo traveled to Savannah in October, where, with representatives of the Lower Creeks, the native leaders reached agreement with Gov. Sir James Wright and Indian Superintendent John Stuart to halt their attacks in exchange for a resumption of trade.

At the start of the American Revolutionary War, Stuart understood that Britain could rely on the support of the Creeks, the Chero-

kees, the Choctaws, and the Chickasaws, all of whom considered the westward expansion of the colonies a significant threat. These tribes believed that if the British prevailed in the war, they would protect native land rights from further encroachment. However, divisions prevailed among the Creeks, as many leaders hesitated to join the war against the colonists without assurances of British support. Emistisiguo disagreed and led his followers against the rebels, often cooperating closely with Lieutenant Colonel Thomas Brown's Loyalist Florida Rangers.

Other Creeks, influenced by American agent George Galphin, attempted to kill Emistisiguo and some British agents in 1777 but failed. Stuart eventually secured the allegiance of these dissidents, but Emistisiguo, undaunted, continued to harass the Americans on the frontier.

After British forces had been confined to Savannah in 1782, Emistisiguo led several hundred Creeks in an attempt to reach the town. Finding his way blocked by American troops under Brigadier General Anthony Wayne, Emistisiguo launched a surprise night attack on the American camp near Gibbons's Plantation. Wayne's troops repulsed the natives after a fierce struggle in which Emistisiguo was killed.

Encomienda

A feudal-like arrangement that involved land allotments—but not grants—as well as a tributary system of labor for Spanish conquistadors. The word "encomienda" comes from the Spanish word *encomendar*, meaning "to entrust." Spanish conquistadors employed the encomienda throughout the Spanish empire in return for services to the Crown. The encomendero, or holder of the encomienda, received a revocable grant from the Crown that included the native peoples occupying the land. The encomendero did not actually possess native lands, although his absolute power made him the de facto local ruler.

First used in Spain against the Moors, then established by the Castilian Crown for the empire in May 1493, the encomienda was designed to spread Catholicism and Spanish civilization to the natives as well as to protect them against outside attack. For such services, natives were bound to provide labor to the encomendero. By the Law of Burgos, any encomendero with 50 people or more

under his care was required to instruct one young male who could teach the others the tenets of Catholicism and other "civilizing" lessons. The crown also encouraged intermarriage as a means of civilizing the natives.

The encomienda was not inheritable, and the natives retained ownership of their lands as well as independence from encomendero legal or political control. In practice, however, they were often subjected to significant and arbitrary exploitation at the hands of the encomienda holder. Far from official oversight and control, the conquistadors indulged their voracious appetites for wealth. Unwilling to perform manual labor themselves, ambitious encomenderos acquired lands of their own and established a plantation-like economy based on free labor performed by the natives. The encomenderos eventually became a landed gentry, living off the backs of indigenous peoples, many of whom became virtual slaves. Empowered to set the amounts of tribute (tax) that could be collected from the natives, encomenderos used that power to exact huge concessions from them. Very soon, abuses of the system in the Caribbean contributed to major population losses. The Caribbean encomienda was all but defunct within a generation.

The New Laws of 1542 and the establishment of the Council of the Indies set limits on the amount of tribute and established local government in the form of the Audienca. However, the encomenderos quickly took control of local governments and the encomienda continued, although it evolved ultimately into the repartimiento, finally becoming debt peonage.

Endicott, John

Born: ca. 1588

Died: March 15, 1665

Governor of Massachusetts (1628–1630, 1644–1645, 1649–1650, 1652–1654, 1655–1665) and colonial military leader best known for his exploits during the Pequot War. John Endicott (also spelled Endecott) was born in Devon, England, about 1588. It is believed that he had some military service before joining the New England Company and leading a group of colonists to Salem, Massachusetts, in 1628.

Endicott served as governor of Massachusetts Bay Colony until the arrival of John Winthrop in 1630. A staunch Puritan, Endicott

John Endicott, colonial magistrate and governor of the Massachusetts Bay Colony. Endicott is best known for his military exploits leading up to and during the Pequot War. (Library of Congress)

is often associated with his strict reproach of religious dissenters, such as the tearing down of Thomas Morton's maypole and the hanging of Quakers.

In 1636, Endicott led a group of 90 colonial volunteers on a preemptive strike against the natives of Block Island and the Pequots. This action precipitated the Pequot War. Outraged by the assault, the Pequots retaliated against the English at Fort Saybrook. The war culminated in the 1637 Mystic Fort Fight, which killed 700 Pequots and virtually extinguished the tribe.

Considered an upstanding citizen of Salem and Massachusetts Bay, Endicott held several high offices, including the governorship, for multiple terms. After the death of John Winthrop in 1649, Endicott served as either governor or deputy governor of the colony until his death on March 15, 1665, in Boston.

Endicott Expedition

Event Date: August 1636

Military expedition mounted by Massachusetts Bay Colony against Native Americans on Block Island (now part of Rhode Island) that precipitated the Pequot War. In July 1636, a ship captained by John Gallop came on John Oldham's pinnace near Block Island. Seeing a number of Block Island Native Americans on board, Gallop investigated. A fight ensued in which Gallop and his men killed 10 or 11 of the natives before discovering Oldham's body below deck.

The Block Islanders paid tribute to the Narragansetts, and Massachusetts then sent a delegation to the Narragansetts to investigate Oldham's murder and whether that tribe was hostile to the English. The investigators returned with a report that the leading Narragansett sachems (chiefs) were loyal and willing to punish those responsible. Nonetheless, Gov. Henry Vane of Massachusetts ordered John Endicott (also spelled Endecott) to lead a force of volunteers from the colony against Block Island.

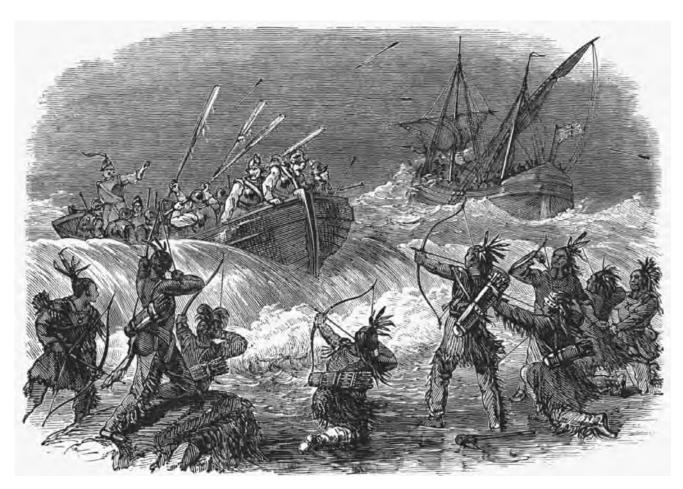

Vane's instructions to Endicott were to take possession of the island, killing all the native adult males there and capturing the

women and children (who would then be sold as slaves). Immediately thereafter, Endicott was to sail to Pequot territory and there demand the surrender of those natives responsible for the 1633 murder of colonist John Stone. The Pequots were to pay damages in wampum and to turn over several Pequot children as hostages to ensure the tribe's future good behavior.

Endicott's force of some 90 men set sail in five ships on August 24. Endicott had the assistance of captains John Underwood, Nathaniel Turner, William Jenningston, and an Ensign Davenport, as well as two native guides. High waves and wind at Block Island prevented their ships from effecting a landing, and the men had to disembark off shore and wade in, whereupon they promptly came under native attack. Musket fire soon brought a native retreat, however.

Over a two-day period Endicott and his men attempted to do battle with natives, who had sought refuge in the swamps on the island. The colonists burned two abandoned villages and set fire to much of the island, including its corn fields. After having killed perhaps as many as a dozen natives and unable to locate the remainder, Endicott ordered his men to return to their ships in order to fulfill the second part of his orders.

Endicott first sailed to Fort Saybrook at the mouth of the Connecticut River on Long Island Sound. His men remained there for

Woodcut depicting the colonial attack on Native Americans inhabiting Block Island, 1636. John Endicott led some 90 Massachusetts Bay volunteers to Block Island, touching off the Pequot War. (North Wind Picture Archives)

four days because of bad weather. The commander of the fort, Lieutenant Lion Gardiner, was a strong critic of the expedition, fearing native retribution on Saybrook, wondering why Massachusetts leaders would be mounting a military expedition to avenge the murder of a Virginian, and warning Endicott of the likely repercussions.

When Endicott's ships finally sailed up the Pequot River, the Pequots inquired as to the reason for the English presence. Endicott remained on his ship and did not answer. The next day the Pequots sent an emissary to meet with Endicott, who then revealed the purpose of his expeditionary force, saying that he had come to avenge the killing of Virginian John Stone. The envoy replied that the sachem Sassacus and others had killed Stone in retaliation for the murder of the sachem Tatobem. The Dutch had captured and killed the grand sachem, and the Pequots had taken revenge on Stone, not recognizing that he was English. In their defense, the Pequots believed that it had been an honest misunderstanding and that the murder had been justified. They refused, therefore, to surrender those involved in the attack.

The envoy departed and asked the English to wait for a response. Fearing a trick, the English went ashore, ready to do battle. The Pequots asked for time, claiming their principal sachems were away. Endicott took this as a ruse by which the Pequots would gain time to prepare for battle, and he ordered an attack.

Here, as on Block Island, the Pequots refused to fight; they simply fled. Endicott repeated the tactics of Block Island, torching and destroying the Pequot settlements and crops. Endicott's force then returned to Massachusetts Bay, having failed to accomplish any of the mission's objectives.

As Gardiner predicted, Endicott's actions led to war. Despite defense of the action by new governor John Winthrop (1637–1640) as necessary to avenge the deaths of two Englishmen, colonial settlements and trading posts on the Connecticut River soon came under attack by angry Pequots. This fighting soon expanded into the destructive Pequot War.

English Bend (Louisiana)

Heavily reinforced French stronghold located some 15 miles southeast of New Orleans along the Mississippi River. Now known as

Shingle Point or English Turn Bend, this point on the river was originally called Detour de l'Anglois (English Bend). Jean-Baptiste Le Moyne de Bienville, who eventually became Louisiana's first governor, gave the point its name in 1699. That year, Bienville took charge of the 70-man garrison at Fort Maurepas on Biloxi Bay while his brother Pierre le Moyne d'Iberville returned to France with news of the new colony. While exploring the lower Mississippi in 1699, Bienville encountered an English corvette bringing French Huguenots to found a colony on the Mississippi. Bienville managed to convince its captain that the river was already in French possession, and the corvette departed. Henceforth, the spot came to be called English Bend. The incident is noted in d'Iberville's Second Voyage to the Mississippi, The Journal of the Renommée.

The French considered English Bend as a potential site for the capital of Louisiana, but they instead chose New Orleans in part because of ocean access. Still, it remained an area of strategic importance, particularly during King George's War (1744–1748).

Following the British capture of Louisbourg in 1745, Louisiana governor Pierre de Rigaud de Vaudreuil de Cavagnial developed plans for creating fortifications on either side of the Mississippi at English Bend. These plans came into fruition a few years later with the construction of earthworks to hold batteries of 18-pounder guns. Although Vaudreuil had wanted stone fortifications, they were deemed too expensive and were never built.

The battery on the right side of the river was named Fort St. Leon, and the battery on the left was called Fort St. Marie. The 1748 Treaty of Aix-la-Chapelle temporarily ended hostilities in the New World, which meant that the French removed the cannon from English Bend and placed them in storage. They likewise withdrew garrisons at Fort St. Leon and Fort St. Marie.

By 1751, however, the international situation had deteriorated and Vaudreuil reestablished garrisons and built officers' quarters at both forts. By 1753, there were a total of 42 guns at English Bend: 30 18-pounders, 48-pounders, 46-pounders, and 44-pounders. By the middle of the French and Indian War (1754–1763), each fort had a garrison of 3 officers, 2 noncommissioned officers, and 20 to 25 soldiers. The British, however, never attempted an invasion of Louisiana.

In 1762, France ceded this portion of Louisiana to Spain, and English Bend was abandoned again. The French shipped their cannon back to France, and the forts fell into disrepair. It was not until 1807 that the U.S. government, after purchasing the Louisiana territory from France, built its own fortifications on the site. Although these fortifications were not involved in any action during the War of 1812, their garrisons did help to defend New Orleans in 1815.

English Bill of Rights

Event Date: February 13, 1689

Declaration of certain civil and governmental rights promulgated by Parliament during the Glorious Revolution and made a condition for William III and Mary II to ascend the throne. The English Bill of Rights was one of the most important documents in the legal history of Great Britain and its colonies. Along with the Magna Carta (1215) and the Habeas Corpus Act (1679), it is a fundamental document in the development of liberty and the "rights of Englishmen." The bill in fact marks the beginning of the supremacy of Parliament over the king in England.

On February 1, 1689, a convention of Parliament declared that King James II had abdicated his throne by his flight to France. It also issued a Declaration of Rights, which was reissued by Parliament on February 13, 1689, as the English Bill of Rights. The declaration provided that James II had endeavored to subvert and destroy the Protestant religion as well as the laws and liberties of England. It also held that he had assumed power to dismiss or block the execution of laws without the consent of Parliament. In addition, it charged that he had promoted "unacceptable" religious practices, maintained a private army, and levied taxes without Parliament's consent.

In addition to stating grievances against James II, the Declaration of Rights established important principles of England's

Etching of William III and Mary II ascending the English throne in 1689. (Brown Brothers)

constitutional monarchy and, by extension, its colonies. It guaranteed members of Parliament freedom of speech and immunity of prosecution for statements made in parliamentary debate. It prohibited the king from levying taxes without Parliament's consent and forbade a standing army in peacetime without parliamentary approval. In addition to guaranteeing the right to trial by jury, it forbade the king from interfering with jurors. Finally, it required frequent meetings of Parliament (subsequently spelled out by the Triennial Act) and forbade the king from interfering in parliamentary elections.

The Glorious Revolution and the English Bill of Rights firmly established Parliament as the dominant force in English politics and codified accepted practices of constitutional governance. The latter formed the foundation of rights for British colonists in the New World.

English Civil War, Impact on America

The period of the English Civil War (1642-1649) and Interregnum (between reigns) that followed had a profound impact on the English North American colonies. During this time frame, the colonies enjoyed considerable autonomy and underwent significant change in their political institutions.

Discontent in England between Parliament and King Charles I (1625-1649) led to civil war in 1642. The struggle was essentially between royal absolutism and parliamentary rule. Religion was also an important factor, as the Puritan-dominated Parliamentary side rejected the High Church Anglicanism of Charles I, the religious authority associated with the monarch, and the open Catholicism of some members of the king's circle.

On the victory of Parliamentary forces and the execution of Charles in 1649, Puritan leader Oliver Cromwell assumed control of the English government. This period, referred to as the Interregnum, lasted until 1660, when the monarchy was restored under King Charles II. The new government did little regarding the colonies until the Council of State was formed in 1649. During the English Civil War, the mid-Atlantic colonies of Virginia and Maryland experienced some population expansion from English immigrants who arrived soon after the Puritans assumed power.

Many were supporters of Charles I who chose to emigrate to avoid persecution.

Events in England also had political repercussions in the colonies. When Cromwell's Council of State attempted to secure recognition from Virginia, that colonial government refused. Emissaries from London sent in 1651 achieved that recognition in 1652 by granting Virginia's assembly the power to legislate and authority to choose a governor and councilors.

Maryland experienced rebellion during the English Civil War, by which time the majority of the colony's population was Protestant. In 1645, the Protestants rebelled against their Catholic governor, Leonard Calvert, forcing him into exile in Virginia. Protestants governed Maryland until the spring of 1647, when Calvert regained control of the colony. Before his sudden death in June, Calvert appointed a staunch royalist, Thomas Greene, as governor. In 1648, Lord Baltimore demoted Greene to the council and replaced him with William Stone, a Protestant. In 1649, the colony's government passed the Toleration Act to protect the Catholic minority and promote religious tolerance. In 1654, this act was challenged by the Protestants with the support of the commissioners. The next year saw an armed clash between the Protestants and Lord Baltimore's forces. The Protestants won the contest and retained control until the restoration of Lord Baltimore's proprietary rights by Charles II.

Cromwell's government in England largely ignored the New England colonies, the leaders of which soon came to the conclusion that they would need to address problems on the local level themselves rather than count on the government in England. The English Civil War brought both a decline in immigration to the region and an economic depression. In 1643, New Englanders established the New England Confederation to oversee the internal affairs of the Massachusetts, Plymouth, Connecticut, and New Haven colonies. This body dealt with the economic depression, intercolonial boundary and commercial disputes, and the military threat posed by the French, the Dutch, and the Native Americans in the region until the mid-1660s.

The English Civil War had unforeseen long-term effects on the North American colonies. The brief period of self-government at this time resulted in important political reforms in the colonies and in a sense permanently altered their relationship with Britain and the Crown.

Esopus

Native American group that occupied the Hudson River Valley and Delaware River Valley as the Dutch and English began to colonize the region. The Esopus were a classic colonial tribe in the sense that they organized during the colonial period in response to changing colonial power relations among native tribes and between natives and Europeans. Indications point to Lenni Lenape ancestral roots. The Esopus, along with the Dutch, controlled much of the vital Hudson River trade from the Great Lakes to the Atlantic in the early 1600s. As with most native groups of the region, the Esopus relied on agriculture, hunting, fishing, and trapping to power their economy. As the colonial period progressed, fur trapping became especially important for trade with the Europeans.

In the pre-Columbian period, Algonquin legends suggest that the Lenape, the Nanticoke, the Powhatan, and the Shawnee peoples all came from an Algonquian-speaking, Lenape homeland, probably associated with mound-building cultures. The Lenapes (or "true ancestor people") slowly migrated and were transformed into the Delaware peoples that occupied much of the New York area by 1600. The northern Lenapes occupied the region from the headwaters of the Delaware River to the Catskills and the western shore of the Hudson River. By the mid-17th century, these Munsee-speaking peoples or "people of the stoney country" were known as the Esopus, who were subdivided into four principal tribal groups: Catskills, Memekotings, Waranawonkongs, and Warasinks.

As the Dutch settled the Hudson Valley during 1610–1664, they established a relationship with the Esopus that was alternatively cooperative and antagonistic. By 1660, the Dutch numbered 10,000 people; the Esopus numbered perhaps 15,000. The Esopus, as with many other native groups, were not really a tribe or even a nation. Rather, they were a set of linguistically and territorially related clans and bands that defined relationships of power with one another and with Europeans on that level. The so-called wolf and turkey clans were the most prominent. They also had the most dealings with the Dutch.

With the French in Canada, the English in New England, and the Dutch and the Swedes along the Hudson and Delaware Rivers, power relationships in the 1600s changed radically for the Esopus. Conflicts with the Dutch, the Mohawks, the Senecas, and the Iroquois left the Esopus with little population and even less land. Indeed, the Esopus Wars (1659–1660, 1663–1664) with the Dutch decimated the tribe. A smallpox epidemic in the mid-17th century further taxed the tribe and forced them into refugee status with the Iroquois after 1664. They now became wards of the Iroquois, supplying some manpower and foodstuffs in return for protection. The English takeover of Dutch New Netherland in 1664 cemented their fate by cutting off further trade through the Dutch. Eventually, the surviving Esopus, who had lost all of their land holdings to the

Dutch and the English, migrated west and south to settle in central Pennsylvania, where other Lenni Lenape tribes already resided.

Esopus Wars

Start Date: 1659 End Date: 1664

Armed conflict between the Dutch and their native allies and the Esopus Nation, centered in the Hudson River Valley. The Esopus Wars were part of a long history of conflict between European settlers and natives in the northeast region of North America. Between 1614 and 1640, some 2,000 Dutch colonists settled on Esopus (Waranawonk) lands along the Hudson, from Long Island to Kingston, New York. They did so under the auspices of the Dutch West Indies Company. By 1640, a series of Dutch-native conflicts had developed stemming from land issues and revenge killings. The last of these conflicts were the First and Second Esopus Wars. Ironically, those wars ended with the Dutch destruction of much of the Esopus tribe by 1664, the same year in which the English invaded New Amsterdam and put an end to Dutch colonization in North America. After 1664, the Iroquois Confederation replaced the Esopus as the major native power broker in the Hudson River Valley.

In the early 1600s, French, English, and Dutch colonists flowed into a region already experiencing complicated political affairs between indigenous tribes. The river valleys were key strategic transport corridors, both for trade and for maintaining maritime power. In New York, the Hudson River and its mouth at Long Island was a vital corridor for both Native Americans and Europeans. The natives wanted to be involved in trade markets to receive goods such as firearms and liquor, whereas the Europeans desired native lands along the Hudson River and those lands' resources, such as beaver pelts. A classic colonial confrontation soon ensued with both natives and colonists using the other to reconfigure power relationships in the valley.

At the time of the first Dutch settlement in 1614, the Susquehannocks controlled the east bank of the Hudson, the Esopus the west bank, and the Mohawks the upper reaches around the Catskill Mountains. The Dutch then established Fort Orange (Albany, New York) on the Hudson River in 1614, Fort Good Hope (Hartford, Connecticut) on the Connecticut River in 1624, and Fort Amsterdam (New York City) on western Long Island in 1626. Although claimed by England, which was often preoccupied by war with France and Spain, the region was actually controlled by Native Americans such as the Esopus. The Esopus and other natives tolerated the Dutch presence because they offered an additional outlet for trade, especially for guns that were vital to native diplomatic negotiations and political affairs. With the French in Canada, the English in New England, and the Dutch on Long Island, the Hudson River became the strategic center of trade, with New Amsterdam as the key port.

Dutch expansion upriver, the devastation wrought by Old World diseases, and increasing conflict between native tribes all took their toll on indigenous peoples along the Hudson River. News of the 1636–1638 Pequot War in New England and the virtual extermination of a once-powerful Pequot Nation also heightened tensions and increased the flow of native refugees into the region. This powder keg ignited over a series of revenge killings that led to Kieft's War (1639–1645) with the Raritans around Long Island. That was followed by wars involving the Iroquois (1642–1655), the Anglo-Dutch Wars (1652–1654, 1654–1657) centered on New Amsterdam, the capture of New Sweden by the Dutch in 1655, and a final conflict with the Raritans known as the Peach War (1655–1657). Both the Dutch and the Esopus found themselves increasingly drawn into these conflicts on opposing sides. Inevitably, they were bound to face each other directly over the control of the Hudson River.

During 1652–1655, the Dutch settlement of Kingston, New York, established the Dutch at both ends of the valley. By 1660, the Dutch population was at 10,000. Centered on a small settlement known today as Esopus, Dutch-native land conflicts developed into full-scale war all along the river. The Mohawks entered it on the side of the Dutch and turned the tide against the Esopus. The Mahicans then intervened as peacekeepers and ended the first conflict in 1660. But because the natives were mobile seasonally, the European-style treaty proved inadequate as Mohawk, Mahican, and Dutch interests were advanced at the expense of the Esopus.

Mahicans settled on Esopus lands to act as a buffer against future conflict. Eventually, they left the lands to the Mohawks. Many Esopus refugees fled to Mahican buffer lands only to find that they could not reacquire their homelands when the conflict ended. Return of captives also worked against the Esopus, as many of the Esopus returned from captivity with diseases that spread rapidly.

The Esopus fared even worse in the second phase of the Esopus Wars from 1663–1664. They and the Susquehannocks had dominated the Hudson Valley up to the Dutch arrival. Now both groups found their gunpowder and weapon supplies severely limited. Also, their access to European trade goods had almost been cut off. This was largely the result of Dutch success in halting Swedish and English shipments in 1655 by capturing New Sweden and by a peace treaty with England ending the First Anglo-Dutch War (1652–1654). By 1663, the trade guns remaining to the Esopus were at best old and unreliable, and deadly to the user at worst. Mohawks, supplied by the English and granted access by the Dutch, now poured into Esopus territory. Most Esopus fled as refugees to Mahican lands in the Catskills, never to return to their former home.

In 1664, a British fleet captured New Amsterdam, and the role of the Dutch and the Esopus as major power brokers in the Hudson River Valley ended. The British and the Iroquois now replaced them. The Esopus sold the last of their lands in 1677 to newly arrived French Huguenots and moved west with the permission of their Iroquois landlords to Pennsylvania's Wyoming Valley.

Falls Fight

Event Date: May 19, 1676

Massacre of Native Americans by New Englanders during King Philip's War (1675–1676). The assault took place on May 19, 1676, and helped cripple native resistance and allowed for a venting of colonial frustrations over the guerrilla tactics used against their communities. Settlers learned from engagements such as this to fight counterinsurgencies by relying on native allies, stealth, and the merciless treatment of captives.

Although most natives of southern New England had answered the call of the Wampanoag sachem Metacom (King Philip) to attack European settlements, the momentum in the conflict began to shift in favor of the English by the spring of 1676. Intelligence arrived at Hatfield, Massachusetts, regarding an encampment of Pocumtucks 20 miles away, near the falls of the Connecticut River at a site known as Peskeompscut. An assortment of warriors, women, children, and the elderly had gathered at this popular fishing spot to resupply.

Captain William Turner commanded a small garrison at Hatfield and he recruited men and boys from surrounding towns to mount an assault on Peskeompscut. A Baptist imprisoned several times in Puritan New England for his religious beliefs, Turner owed his billet to the widespread damage suffered in Massachusetts that overrode concerns over spiritual compatibility. Weakened by illness during his latest incarceration, he led a force of roughly 150 troops. They thoroughly lacked discipline, experience, and expertise. Little more than a rabble, Turner's force reached Peskeompscut at dawn on May 19, intent on providing no quarter to a foe whose assaults had threatened every New England colony.

Surprising the unguarded native position, the prearranged signal for the attack entailed firing directly into the wigwams. The

ensuing bloodbath left several hundred natives dead, including women and children. Not a single prisoner was taken. Turner's men rejoiced at suffering merely one fatality.

But the engagement was far from over. The sounds of battle had roused other natives along the Connecticut River, who prepared an ambush. Negligent in planning for his retreat, Turner divided his forces only to face a withering onslaught. Thirty-nine colonists, including Turner, died in the ensuing melee. Although technically the campaign was a triumph for colonists, the high casualty rate of the ambush rendered the earlier victory bittersweet. As word spread of the slaughter, there was no public outcry to reassess the conduct of the war. Attitudes were now hardening among New Englanders as the conflict grew dangerously close to genocide. Indeed, wracked with guilt and uncertainty over the maintenance of what they believed was their unique covenant with God, Puritans embraced a spirit of vengeance that manifested itself on the battlefields and in the courtrooms of their land during and after King Philip's War.

Falls Fight was notable as the first clear-cut English victory in the war (more specifically, in the western theater). It also decimated a still-powerful native force, which adversely affected morale among the native combatants. The battle also served to propel the bulk of Metacom's forces out of the Connecticut River Valley and toward the south and east, into Rhode Island and the eastern reaches of Massachusetts and Connecticut.

Finally, Falls Fight can be seen as a sort of unintended pincer movement against Metacom's forces. The chief had to make the decision whether to retreat west or east. He chose the east because he greatly feared conflict with tribes to his west, in particular the Mohawks. But the east would prove to be no more hospitable, as it was the center of colonial power. In effect, Metacom's forces were

Contemporary illustration of Falls Fight, an English attack on an Abenaki village on the Connecticut River on May 19, 1676, during King Philip's War. Also known as the Peskeompskut Massacre, it brought the deaths of many Native American noncombatants. (North Wind Picture Archives)

stuck between threats on either side. It would thus only be a matter of time before they would meet the brunt of colonial strength, which would bring about the downfall of Metacom.

Falmouth, Battle of

Start Date: May 16, 1690 End Date: May 20, 1690

Battle in which French and allied Native American forces captured Fort Loyal and Falmouth (now Portland, Maine, then part of Massachusetts) as part of a three-pronged attack against English settlements during King William's War (1689–1697). In early 1690, three raiding parties comprised of Native Americans and Frenchmen departed Canada to attack New England's northern and eastern frontiers. One party of 60 Abenakis and 50 French troops under

René Robineau, Sieur de Portneuf, targeted Falmouth and Fort Loyal on the shores of Casco Bay, Maine. By the time Portneuf reached Falmouth in May, his party had grown to 400 or 500 men, having been strengthened by local Abenakis and a French raiding party that had struck Salmon Falls in March.

Falmouth was protected by four garrison houses and Fort Loyal, a picketed stockade along the bluff of the bay, which mounted a few light cannon to command water and land approaches to the town. A large portion of the garrison had left on a scouting expedition on May 10, however, leaving Captain Sylvanus Davis and perhaps 100 men in the garrison.

Portneuf intended to surprise the garrison, but his eager Native American allies gave away their presence by ambushing a solitary settler early on May 16. Davis then dispatched a scouting party of 30 men to investigate the shots, but they too fell into an ambush, and only a handful escaped back to the fort. Falmouth's soldiers and settlers defended the four garrison houses until nightfall and then withdrew into Fort Loyal.

On the morning of May 17, the Abenakis and Frenchmen plundered and burned the deserted village and then turned on Fort Loyal. For three days Portneuf's forces maintained a withering volley of fire on the English fort, wounding many of Davis's men. At the same time, French soldiers crept toward the fort, eventually placing incendiaries against the palisade's base.

Badly outnumbered and threatened by a fiery end, Davis negotiated a surrender with Portneuf on May 20. The French granted quarter to the garrison and promised safe passage to the nearest English town. When the English gave up the fort, however, the French declared them traitors and rebels for supporting the claims of William of Orange against their rightful king, James II. Bargains with rebels being void, the Frenchmen and Abenakis killed or wounded numerous English soldiers and inhabitants and took as prisoners more than 70 men, women, and children, most of whom remained in Abenaki hands.

Combined with attacks on Schenectady, New York, and Salmon Falls, New Hampshire, the destruction of Falmouth caused considerable panic along the New England and New York borders. The New England frontier contracted as soldiers and settlers west of Wells, Maine, abandoned posts and homes. The Abenakis were encouraged by their successes and French participation, and they continued their attacks on English settlements even after Portneuf and his French soldiers had returned to Ouebec.

Firearms Trade

Firearms played an important, perhaps vital, role in the European settlement of North America. Conflicts between settlers and Native Americans were waged with firearms, and European superiority in these weapons gave them an advantage that the Native Americans could never overcome. Naturally, firearms were prized possessions and became one of the most important trade items for the various cultures involved.

The earliest recorded use of firearms in North American warfare was at the Battle of Lake Champlain in 1609. Samuel de Champlain's intervention against the Iroquois to help his Algonquin friends created a conflict between the French and the Iroquois that continued for 150 years. The incident taught the Iroquois that they needed firearms to defend their territory against the newcomers. Fortunately, the Dutch soon opened trading posts with the natives in New Amsterdam (later New York).

Beginning in 1624, Native Americans were able to obtain firearms in exchange for highly prized beaver pelts. By 1630, the Iroquois had driven the Algonquins from their territory. To protect their native allies and to obtain furs, the French began to arm Native Americans allied with them. The English also supplied weapons to natives in their spheres of influence. An average exchange rate of the 18th century

was 1 pelt for a pound of shot or three flints, 4 pelts for a pound of powder, 10 pelts for a pistol, and 20 pelts for a trade gun.

As the demand for furs continued, the number of firearms manufactured for trade to the Native Americans soared. Most European countries followed a policy of mercantilism with their colonies. According to this theory, only the motherland would produce manufactured goods, and the colonies would supply raw materials. Manufacturing was actively discouraged in the colonies. As a result, the vast majority of the firearms produced during the colonial period came from Europe.

Gradually, a specific type of weapon, the trade musket, was developed for trade with Native Americans. It was the most commonly exchanged weapon during the 17th and 18th centuries in North America. European gun makers during this time created weapons for trade that shared certain characteristics, no matter which country produced them. Trade muskets were all smoothbore weapons. Native Americans wanted a firearm that could be used for hunting or warfare. The trade musket could fire either small shot or a ball. Its bore was much smaller than that of European weapons. Eventually, the 24-bore was accepted as standard. This meant that a pound of lead would produce 24 balls for a trade musket. In contrast, the English Brown Bess musket was a 12-bore, meaning only half as many balls could be produced from the same amount of lead. The smaller ball also meant that trade muskets required smaller amounts of gunpowder. These considerations were important to Native Americans, as they could only secure lead and powder from the colonists. In addition, the smaller-bore weapons meant that more ammunition could be carried for less weight than that for the weapons generally carried by the colonists.

Trade muskets also had shorter barrels than those of their European counterparts. In dense forests, shorter barrels were handier and less likely to catch in brush. A 30-inch barrel was most popular, although other lengths were common. The accompanying loss in accuracy with a shorter barrel was acceptable because most targets were relatively close. The trade musket normally was about 4 feet long overall, compared to a long rifle that might be up to 6 feet in length. The trade musket was also plain, without decorations. Many natives preferred to decorate their own weapons with brass tacks, feathers, or paint. Trade weapons were designed to be rugged and stand up to frontier conditions. Trigger guards were also larger than normal, to allow firing while wearing mittens.

Gun makers did all they could to reduce the cost of the trade muskets. This fact and the lack of decorations led many to believe that trade muskets were inferior to European weapons. Stories circulated about trade muskets bursting or breaking, and although some were obviously true, the Native Americans who used the muskets were not fools, and they soon accumulated sufficient experience to recognize an inferior weapon. Keeping trade muskets in working order became such an important issue that most treaties in the 18th century required colonial governments to make gunsmiths available at trading posts to repair Native American weapons.

Florida

The Florida Peninsula, known as La Florida to the Spanish, has long coastlines bordering the Atlantic Ocean to the east and the Gulf of Mexico to the west. Because of its commanding maritime presence and proximity to the Caribbean, Florida has always held an important strategic significance. The Florida Peninsula was initially home to dozens of Native American tribal groups. The first Europeans to undertake significant exploration of Florida were led by Juan Ponce de León, whose expedition mapped the coastline of most of southern Florida beginning in 1513. In the ensuing decade, Francisco Hernández de Córdoba led three expeditions to expand Spanish knowledge of the topography and resources of the region and initiate contact with the native tribes in the region. In 1521, Lucas Vázquez de Ayllón revealed the perils of the slave trade for natives in the region. He invited 60 natives aboard his ship then promptly transported them to the slave markets of the West Indies. By the time of Ayllón's visit, European diseases had already begun to decimate the local populations, opening them to Spanish conquest.

In 1528, Álvar Núñez Cabeza de Vaca mapped the remainder of the Florida Gulf Coast. Yet with the exception of a brief visit during Hernando de Soto's ill-fated plundering expedition, the Spanish largely lost interest in Florida until 1565. In that year, French explorers constructed a fort at the mouth of the St. Johns River (near St. Augustine and modern-day Jacksonville), directly challenging Spanish authority in the region. In response, the Spanish attacked and destroyed the fort, subsequently founding St. Augustine, which has been continuously inhabited since that time. St. Augustine was intended as both a military fortification and a focal point for Spanish missionary efforts in the region. Eventually, the Spanish would build the huge and imposing masonry presidio at St. Augustine known as Castillo de San Marcos.

The lack of any obvious desirable resources in Florida, such as the gold and silver found in other regions of the New World, kept the development of Florida as a fairly low priority for the Spanish authorities. Nevertheless, Spanish influence in Florida steadily grew with the establishment of trading posts and missionary settlements. The missionaries, led initially by members of the Society of Jesus (Jesuits) and later the Franciscan Order, viewed conversion of the local populace as a divine mission.

At times, local tribes rebelled against missionary influence, but the Spanish missionaries consistently established control through the region. Although the Spanish were certainly willing to use military force to subdue the native populations, religion proved most effective. By the 1640s, most Florida Native Americans had converted to Christianity. Catholic priests, meanwhile, remained remarkably flexible in adapting Catholic doctrine to local customs, even allowing the practices of polygamy and matrilineal succession. The conversions were not entirely harmonious, however. Although the Apalachee and Timucua populations entirely converted, each revolted against Spanish control in the mid-17th century. Indeed, the Timucuan Revolt of 1656 was particularly violent. Both revolts were brutally suppressed by Spanish military might, and by 1700, Spanish control of the region was largely unchallenged.

Spanish holdings in Florida remained safe from overthrow or conquest until the establishment of English colonies along the Atlantic Coast of North America. The foundation of Carolina in 1664 and the establishment of Charles Town (present-day Charleston, South Carolina) in 1670 brought English colonists close to territory claimed by Spain. Charles Town lay less than two days by sail from St. Augustine. As English settlers poured into the region and expanded their territory, conflict with Spanish Florida became increasingly likely.

During the colonial period, Spanish Florida and English Carolina fought a series of frontier engagements. In Queen Anne's War (1702–1713), Carolina colonists launched an ill-fated assault on St. Augustine. After the attack had failed, the Spanish retaliated with an equally futile attack on Charles Town. Carolinians also sought to capture Pensacola, in the Florida panhandle, but this effort proved entirely unsuccessful. As in other colonial regions, the war deteriorated into a series of cross-border raids, using native allies to augment the strength of colonial forces. In 1732, the British colony of Georgia was founded; it was designed in part to serve as a buffer zone between Florida and the lucrative Carolina colony.

In King George's War (1744–1748), English colonists again encouraged the British government to attack Spanish colonial possessions, including Florida. Once again, an offensive to capture St. Augustine proved disastrous, as did a joint provincial-regular expedition to Cartagena. Spanish counteroffensives also proved futile, and yet another series of punitive raids characterized the last years of the war.

During the French and Indian War (1754–1763), Spain remained neutral until 1761. When Spain did join the war as an ally of the French, it was too late to turn the tide of battle in the colonies. By becoming a co-belligerent, Spain invited attacks in Florida as well as other locales. At the peace negotiations in 1763, Spain agreed to surrender all of its territorial claims east of the Mississippi River, including Florida. In exchange, Spain received all French North American territory west of the Mississippi River. The king of Spain offered free transportation out of Florida, and most Spaniards sold their possessions to English speculators and departed for Cuba or Mexico.

English control of Florida solidified the safety of the two Carolinas and Georgia. The British government divided its new acquisi-

Depiction of Native Americans attacking the Spanish in Florida in the early 1600s. A 1606 engraving by Theodor de Bry. (Library of Congress)

tion into the provinces of East and West Florida. The latter province attracted some settlers eager to farm the fertile lands along the Mississippi River but was recaptured by Spanish forces from New Orleans in a series of campaigns from 1771 to 1781. Florida remained under nominal English control until 1783, when it reverted to Spanish control as a part of the Treaty of Paris ending the American Revolutionary War (1775–1783). In 1819, Spain agreed to cede Florida to the United States after the U.S. government agreed to assume all private American claims against the Spanish government. Florida became a state in 1845, formally ending the colonial period in the region.

Florida, British Invasion of

Start Date: January 1740 End Date: June 1740

Primary campaign of the Anglo-Spanish War (1739–1744), occurring during January–June 1740. In an attempt to remove Spaniards from their North American outpost at St. Augustine, Florida, British forces under the command of Major General James Oglethorpe attacked St. Augustine in June 1740. Although the invasion came in response to a larger border dispute between English and Spanish officials in North America, Oglethorpe's invasion reflected a final rupture between the two governments in Europe.

Prior to the declaration of war, Oglethorpe had conducted raids along Florida's northern border. In particular, the English sought retribution for Spain's policy toward runaway slaves. Since the early 1730s, the Spanish government in Florida provided refuge to any British runaway slave who was able to reach Florida. These slaves were armed and allowed to live with the African militia at Fort Mosé. In the fall of 1739, South Carolina was plunged into turmoil as a result of the Stono Rebellion, in which slaves killed several whites, and British officials pointed to Spanish policy toward fugitive slaves as its cause. Indeed, participants in the uprising admitted their intentions to travel to Florida in search of freedom.

When Oglethorpe began his invasion in 1740, the Stono Rebellion seemed a legitimate excuse for the attack. In late December 1739, a British declaration of war against Spain arrived in the British colonies. Only weeks later, Oglethorpe began his march toward St. Augustine. After first failing to take Spanish outposts on the St. Johns River, British forces captured Fort Picolata and Fort Pupo on January 7. Oglethorpe was confident that he could conquer Florida. After the quick and decisive victories, his army returned to Georgia to prepare for a final push to St. Augustine. By May 1740, the English had several thousand troops and six warships ready to move against the Spaniards.

As the English traveled southward in late May, Oglethorpe destroyed Fort Diego, a small blockhouse north of St. Augustine. On June 2, English forces closed in on St. Augustine itself. Reconnaissance scouts came up on Fort Mosé, and Oglethorpe prepared to attack this outpost only two miles north of St. Augustine. A violent rainstorm postponed Oglethorpe's plans, but at first light on June 3, British soldiers arrived at the fort only to find the Spaniards had already abandoned it.

Fort Mosé provided Oglethorpe and his men an excellent site from which they could mount their final advance on the Castillo de San Marcos. Directly across the inlet, Oglethorpe stationed another contingent on Anastasia Island, a barrier island directly across from the Castillo. Once the English captured the Castillo, all Florida would fall.

For days, fighting between the two sides raged as the Spanish garrison and most residents of St. Augustine found cover inside the

walls of the stone fort. On June 25, 300 Spanish soldiers marched to Fort Mosé and there defeated the British. This battle marked the turning point in the struggle for Florida.

Shocked at this setback, the English soldiers on Anastasia Island nonetheless continued their bombardment of the fort and city. The impenetrable walls of the Castillo de San Marcos protected the Spanish militia and residents of St. Augustine. While the English shelled the fort to no avail, Florida governor Manuel Montiano waited for reinforcements to arrive from Cuba. Montiano had confidence in the fort's ability to withstand the English attack, but he worried that the residents inside the fort might run out of provisions before the battle ended.

For the English, time also played an important role in the outcome of the battle. Gradually, English morale fell. On June 14, an English soldier defected to the Spaniards, providing them with a complete report of English strength and strategy. The confidence of the English soldiers suffered another reverse on June 26, when Oglethorpe and his men happened upon the decaying bodies of the English killed by the Spaniards at Fort Mosé.

Oglethorpe's last attempt to take St. Augustine involved a bold plan to blockade the city from the Matanzas River, Atlantic Ocean, and St. Johns River. In preventing any water access to or from St. Augustine, Oglethorpe believed he could starve the city into submission. It was, however, too late. Spanish galleys from Cuba slipped through the blockade to bring supplies, and in a matter of days Spanish warships would arrive. With few options and many of his soldiers sick with dysentery, on July 4 Oglethorpe ordered a retreat from Florida. The high hopes of the English of conquering Florida had given way to defeat.

Skirmishes between British and Spanish forces in Florida continued during the remainder of July as the remaining British soldiers found their way home, but the threat to Spanish control had ended. In Georgia and South Carolina, residents could not comprehend how Oglethorpe failed to take St. Augustine. Most expected the Spaniards to retaliate, and Oglethorpe prepared Georgia for an expected Spanish incursion. Finally Spanish troops invaded in 1742, but they met defeat in the Battle of Bloody Marsh on July 7. Although this Spanish reverse did not erase the memory of Oglethorpe's loss two years earlier, it ended a decades-long struggle between England and Spain over the southeastern borderlands.

Florida, Franco-Spanish Conflict over

Start Date: September 20, 1565

End Date: April 1568

Struggle between France and Spain over control of Florida. Although Spanish explorers had visited the coast of Florida and Spaniards had occasionally visited that peninsula to capture Native Americans to work as slaves in their Caribbean colonies, Spain made no effort to establish a permanent settlement there until 1521. In that year, Juan Ponce de León, who had led an earlier expedition to Florida in 1513, tried to establish a colony on the peninsula but was stopped by food and water shortages and Native American resistance. Pánfilo de Narváez led another expedition to Florida in 1528, which suffered disaster in a storm on its return after failing to find gold. Another attempt to establish a colony in Florida, led by Hernando de Soto in 1539, was abandoned when de Soto set out across the American Southeast in search of riches.

Frequent warfare between France and Spain from 1521 to 1559 led French king François I to consider challenging Spanish control in America by establishing a French presence there. However, these intentions produced no results except the harassment of Spanish shipping in the area by French privateers. Finally, in 1562, Charles IX and his chief minister, Gaspard de Coligny, revived the plan.

Coligny, who was a Huguenot Protestant, hoped to simultaneously strengthen France in relation to Spain and provide a refuge for his co-religionists by sending them to colonize North America. In May of that year, 50 Huguenots led by Captain Jean Ribault landed at Port Royal, near modern Beaufort, South Carolina, and built a fort there. Ribault returned to France for supplies and reinforcements, but when he did not come back, the colonists built a ship and also returned to France. Learning of the French presence, the Spaniards dispatched a military force there that destroyed the abandoned fort. A year later, the Spanish established the settlement of St. Elena on the site of the wrecked fort, which they considered part of Florida.

The French made a second attempt to colonize Florida in 1564, sending René de Laudonnière along with 300 Huguenots to secure France's claim to the region. Laudonnière landed at the mouth of the St. Johns River, where the French built Fort Caroline (also known as Charlesfort). After a promising start, the French explored the area and established a good relationship with the local Timucuan tribe; however, food shortages caused dissent among the colonists. Some left, and others blamed Laudonnière for the problems and staged an unsuccessful mutiny.

Spanish officials became aware of the threat to their position in Florida and dispatched Pedro Menéndez de Avilés with 1,000 men and four ships to oust the French. Menéndez landed at the site of present-day St. Augustine, 40 miles south of the French colony, in 1565. The Spaniards immediately erected a fort to protect their position. Indeed, Menéndez had arrived just in time to prevent the landing of 600 French reinforcements led by Ribault.

With his ships blocking Ribault's access to the St. Johns River, Menéndez set out to destroy Fort Caroline. On September 20, 1565, 500 Spanish soldiers stormed and captured the French fort after a brief struggle. Laudonnière and some 50 people managed to escape and eventually returned to France. Menéndez, after learning that his prisoners were Protestants, executed about 130 men but spared 60 women and children. He then marched back to St. Augustine to deal with Ribault.

While Menéndez attacked Fort Caroline, Ribault sailed along the coast seeking access to the St. Johns River. During his journey, a storm wrecked the French ships and fewer than 400 survivors managed to reach shore. Learning of their location from his Native American allies, Menéndez marched south to find the French. On his way, he encountered and annihilated several small groups of Huguenots before encountering Ribault and his defenseless followers at Matanzas Bay. After fruitless negotiations between the two commanders, Menéndez ordered the execution of the approximately 350 remaining French on October 12.

The capture of Fort Caroline and the destruction of Ribault's expedition put an end to French efforts to colonize Florida. The Spanish established a settlement at St. Augustine and occupied Fort Caroline, which they renamed Fort San Mateo. In April 1568, the French avenged Menéndez's massacre when Dominique de Gourgues attacked Florida with more than 150 men, capturing two small Spanish posts and then seizing Fort San Mateo. Gourgues then executed all of his Spanish prisoners and claimed that the Spanish loss equaled the number of French killed three years earlier by Menéndez. Despite this success, the Spanish hold on Florida remained secure.

Forbes Campaign

Start Date: April 1758 End Date: November 1758

Successful British military campaign in the summer and fall of 1758 against Fort Duquesne during the French and Indian War (1754–1763). In 1758, Prime Minister William Pitt reorganized British military strategy in the French and Indian War. Determined to break French power in the Western Hemisphere, Pitt outlined plans for a major offensive in North America while deemphasizing British efforts in other theaters of the conflict. Pitt's strategy hinged

on a two-prong assault against French positions in Canada. His goal was the capture of New France's two principal settlements of Quebec and Montreal, which Pitt believed would force French capitulation in the North American theater.

In order to achieve his objective, Pitt hoped to seize control of the upper Ohio River region from the French so that British armies could simultaneously pressure Canada from access corridors in the Great Lakes and along the St. Lawrence River. The key to French control of the upper Ohio River Valley was Fort Duquesne, located at the Forks of the Ohio River (present-day Pittsburgh). Following the dismal failure of Major General Edward Braddock's campaign to capture the fort in 1755, the French had used it as a supply depot and organizational center in support of far-ranging Native American raids against the Pennsylvania and Virginia frontiers. These raids devastated the backcountry regions of Pennsylvania and Virginia, preventing either colony from supporting the British war effort to London's satisfaction. Recognizing the potential benefit of bringing the two largest American colonies more fully into line with British military needs, Pitt made the capture of Fort Duquesne a primary military objective for 1758.

To command the campaign, Pitt chose Brigadier General John Forbes, a Scottish surgeon turned soldier whose prior experience included service in the War of the Austrian Succession and the suppression of the Scottish Highland uprising in 1745. Determined not to repeat Braddock's mistakes, Forbes carefully planned his campaign. He spent several months in Philadelphia organizing an army of some 7,000 men, the majority of whom were colonials raised in Pennsylvania and Virginia. Among Forbes's colonial staffers were several future prominent American military leaders, including George Washington.

Forbes developed a plan of advance through the southern Pennsylvania countryside that mandated that the British Army stop and secure each segment of territory along the march before moving forward. Thus, during the summer of 1758, Forbes's army advanced cautiously, hacking a road out of the rugged wilderness and stopping often to construct forts and blockhouses where provisions and reserve garrisons were located. The crux of these responsibilities fell to Forbes's chief assistant, Lieutenant Colonel Henry Bouquet, who executed them with great competency. As a result, Forbes secured a lasting British presence in the region, one that would be difficult to dislodge even if the British failed to conquer Fort Duquesne.

As he marched his army west, Forbes decided to employ diplomacy in an effort to deprive the French of their native allies. Forbes sent a diplomatic mission under the leadership of Moravian missionary Christian Frederick Post inviting native representatives to a peace conference with the British at Easton, Pennsylvania. When native leaders accepted, Forbes ordered colonial officials to address Native American land grievances. After lengthy negotiations, the Easton Conference produced a tenuous peace agreement by which the natives of the upper Ohio Valley agreed not to participate in the fighting when Forbes's army reached Fort Duquesne.

All that remained was for Forbes to complete his mission and drive the French from the Forks of the Ohio. The final events of the

campaign proved anticlimactic, however. Following an ill-fated assault against Fort Duquesne by advance units of Forbes's army under Major James Grant, Forbes reigned in his troops and debated whether to delay an all-out assault until the spring of 1759. Fortune, however, favored Forbes. Impressed by the size of the British force and distressed by the inability of the French to provide them with adequate supplies and provisions, in November the few Great Lakes tribes still supporting the French at Fort Duquesne melted away into the forests. Recognizing their inability to hold the fort without Native American assistance, on November 24 the small French garrison demolished the main structures and retreated down the Ohio River. Attracted by the noise of the exploding powder magazine, Forbes ordered his advance units forward, and they took possession of the smoldering ruins the following day. Forbes dubbed the site Pittsburgh in honor of his patron, William Pitt, and authorized the construction of a significantly larger garrison to be known as Fort Pitt.

Forbes had triumphed where Braddock had failed. His success was surely the result of careful planning and skillful diplomacy, and his campaign proved successful on all fronts. It opened a route for British military units to threaten French positions in Canada from the west, relieved the pressure on the frontiers of Pennsylvania and Virginia, and induced those colonial governments to be more forthcoming with economic and logistical aid for the war effort. Forbes, however, did not live long enough to reap his just rewards. Ill for much of the campaign, he returned to Philadelphia in January 1759, where shortly thereafter he succumbed to his aliments.

Forbes, John

Born: September 5, 1707 Died: March 11, 1759

British general who led an expedition to destroy Fort Duquesne in 1758 during the French and Indian War. John Forbes was born on September 5, 1707, in Edinburgh, Scotland. After training in medicine, Forbes purchased a coronet's commission in the Scots Greys cavalry regiment in 1735. Serving in Flanders during the War of the Austrian Succession (1740–1748) as an aide-de-camp and quarter-master general, he was present at the Battle of Fontenoy and the Battle of Laffeldt. Forbes also served in the 1745 Jacobite Rising, seeing action at Culloden. Appointed colonel of the 17th Foot in early 1757, he went to North America to serve as adjutant general to the commander in chief, John Campbell, Lord Loudoun.

Promoted to brigadier general by Prime Minister William Pitt on December 28, 1757, Forbes was assigned to lead a campaign against Fort Duquesne, which Major General Edward Braddock had failed to capture three years earlier. Rather than repeat Braddock's failed advance on Fort Duquesne through Virginia, Forbes, much to George Washington's dismay, chose a route through Pennsylvania. Although shorter in distance, this course of advance required the opening of a new 200-mile road over the rugged Allegheny Mountains.

Arriving in Philadelphia in mid-April 1758 to take command of his expedition, Forbes spent several weeks organizing his troops, supplies, and financial backing as well as resolving difficulties with colonial leaders and his Native American allies. By the time he reached Carlisle, Pennsylvania, in July to begin the offensive, a force comprised of 5,000 provincial troops, 1,400 Montgomery Highlanders, 400 Royal Americans, and 40 artillerymen had been assembled.

Assigning command of the expedition's forward elements to the capable Lieutenant Colonel Henry Bouquet, Forbes devoted his attention to the construction of Forbes Road, which included the building of a series of forts at intervals along the route. He also ensured the maintenance of adequate supplies and negotiated with the Shawnees, the Delawares, and other tribes to deny allies to the French. Throughout the expedition Forbes was ill with dysentery and in severe pain, which limited his travel to a litter borne by horses.

On September 14, 1758, an advance force of 800 men, led by Major James Grant, engaged the French at Duquesne without authorization from Forbes or Bouquet. Despite suffering a severe reverse and losing 300 men, Forbes's expedition, unlike that of Braddock, was not forced to retreat but, instead, was in a strong position to continue its advance.

Abandoned by their native allies and cut off from Canada by John Bradstreet's destruction of Fort Frontenac, the French quit their position at Fort Duquesne in November 1758. With Forbes less than a day's march from the fort, the French abandoned and burned Duquesne. The British occupied the remains of the fort on November 25. Plagued by illness, Forbes remained at Fort Duquesne for only a week, long enough to rename it after Pitt, before he returned to Philadelphia, where he died on March 11, 1759.

Forks of the Ohio

The strategically vital confluence of the Monongahela River and Allegheny River that forms the Ohio River at the site of present-day Pittsburgh, Pennsylvania. Considered the key to control of the Ohio Country, the Forks of the Ohio became the target of French, British, native, and colonial ambitions and thus served as the flash point for the French and Indian War (1754–1763).

The Forks of the Ohio dominated trade along the river routes up the Ohio north to French Canada and down the river south to British Virginia. Although valuable, the forks also presented strategic challenges. For the French, supplying a post at the forks relied on a chain of forts from the St. Lawrence River through the Great Lakes and down the Allegheny River. Loss of any one fort in the chain would isolate those farther along it. For the British, there was no direct water route to the forks, requiring the construction of roads to support any major effort aimed at the forks, either from Virginia (Major General Edward Braddock's route) or across Pennsylvania (Brigadier General John Forbes's route).

The French, the British, and the Iroquois Confederation (along with other native nations) disputed ownership of the Ohio Country and its strategic heart. The Ohio Company, a group of Virginia and London land speculators, attempted to build a fort at the forks, but was driven out by the French. The Virginia colonial government's effort to support the company with armed forces led by company member George Washington resulted in open warfare between the Virginians and the French, supported by their native allies. French victory allowed the construction of Fort Duquesne at the forks and opened the French and Indian War.

In response to the Virginians' defeat, the British dispatched regular troops under Braddock, who also failed to dislodge the French. A later British effort under Forbes in 1758 proved successful. The French destroyed Fort Duquesne and retreated, allowing the British to construct Fort Pitt to control the forks.

Fort Pitt rapidly attracted British settlers, both to trade with the natives and to farm the fertile lands of western Pennsylvania. The natives welcomed the traders but not the farmers, leading to increased tension. Changes in British policy regarding gifts and trade regulation also contributed to the outbreak of Pontiac's Rebellion in 1763, which included an unsuccessful siege of Fort Pitt, the final effort to wrest control of the Forks of the Ohio from the British.

Fort

A site or structure that was fortified so as to provide protection and defense. Because of the threats posed by hostile Native Americans and rival colonists, fortifications were crucial in many areas during the colonial period. European settlers built most of the forts, although natives also fortified some of their towns and villages. Forts ranged in size from a single wooden blockhouse or palisade to a virtual city surrounded by stone walls. Although the primary purpose of a fort was protection, some forts, especially those on the frontier, also served as storehouses or trading posts.

The first forts in North America were built by the continent's first inhabitants—the Native Americans. These were the simplest of fortifications, usually consisting of a palisade of upright logs. Offering only minimal protection, they were susceptible to fire and relatively weak against gunpowder weapons. The battles against the Pequots at Mystic Fort and the Narragansetts at the Great Swamp Fortress showed the ineffectiveness of native fortifications, especially against European weapons.

The earliest structures fortified by the colonists were in two forms: blockhouses and simple forts. These posts protected local populations from raids by hostile natives or enemy soldiers, provided temporary shelter to nearby settlers when facing such threats, and housed the munitions and provisions necessary to guard the town's inhabitants for a limited time. These structures were not intended to house the citizenry for extended periods; rather, they provided protection until either assistance arrived from other towns or the assailants left or were repelled by the town's militia. Many settlements relied on blockhouses, which were often surrounded by a simple wooden palisade, for protection. Offering rudimentary protection, these palisades were constructed of logs placed in the ground vertically and sharpened at the top to discourage scaling attempts. Land outside the palisade was cleared of brush to create a firing zone clear of obstacles and to deny the enemy places for cover.

Fortifications Used during the Colonial Period in North America

Name	Description
Abatis	Obstruction made of trees placed in front of a field fortification
Blockhouse	One- or two-story structure used by militias, usually made of logs
Breastworks	Temporary, chest-high defensive structures made of earth or timber
Fort	Permanent structure used for protection or defense
Garrison house	Private dwellings used for local defense
Presidio	Permanent Spanish fort, often made of adobe and used for defense against Indians
Redoubt	Unsophisticated, temporary, fully enclosed field fortification, often made of earth

Some early settlements possessed larger dedicated forts. The earliest were triangular in shape, such as France's Fort Caroline, near present-day Jacksonville, Florida, and James Fort, built to protect the English inhabitants of Jamestown, Virginia. Both of these garrisons contained a few cannon mounted on earthen bastions, or outward-projecting fortifications that provided flanking fire along the fort's walls and created overlapping firing zones outside the fort. They also featured simple wooden palisades. Early forts could also be square or rectangular, although many, especially those near smaller settlements, lacked artillery.

Frontier forts often defended a nation's territorial claims, protected goods that fostered and preserved trade with Native Americans, and served as safe houses in which frontier-dwelling colonists could seek shelter in case of attack. Because they served many of the same purposes, frontier forts bore strong resemblances to early fortifications. They were almost always made of timber, rather than stone. Although they were generally more significant structures than the early forts, frontier posts were usually not designed to withstand artillery bombardment. Most took the form of a dedicated blockhouse surrounded by a simple wooden palisade. They contained few, if any, artillery pieces.

Forts built along the primary routes between supply centers and frontier forts served as way stations that protected the men and goods making the journeys. The British posts at Fort Bull and Fort Brewerton guarded goods en route from Albany to Oswego. France's Fort Machault offered safety to merchants and soldiers ferrying supplies to Fort Duquesne. These posts often guarded major portages as well. Britain's Fort Stanwix protected the so-called Great Carrying Place, the portage that connected the Mohawk River and Wood Creek in upstate New York. The French strongholds like Fort Ticonderoga and Fort Niagara each contained small forts or blockhouses that defended nearby portages, and Fort de la Presque Isle and Fort Le Boeuf each guarded the two ends of the portage between Lake Erie and French Creek. Britain's Fort Venango consisted of a large central blockhouse with some outworks. Forts built along major thoroughfares were also natural links in a colony's

communications system and could be used to extend supply lines in times of war.

By the beginning of the 18th century, stouter forts began appearing. With growing populations and territorial expansion, tensions among the French, the British, and the Spanish colonies began to escalate. In addition to native attacks, officials thus began to fear full-scale invasions of their most strategic areas by the military forces of rival colonial powers. Fortifications designed to withstand artillery bombardment and prolonged sieges were now built with more frequency. The strongest forts were made of stone, but most in North America were still constructed of timber. The decision to build with wood was primarily attributed to haste, as Europeans put up outposts very quickly to counter an immediate threat. But speed compromised quality, resulting in a weaker structure. In some cases, proper construction materials were not readily available, or if available, difficult to access. The use of stone meant either expensive transportation of necessary materials, or if supplies existed nearby, quarrying, which required significant time and intensive labor. Fort Duquesne and Fort William Henry each had facings of logs instead of stone. Fort Carillon was built of timber, with the intention of later adding a stone facing. Fort St. Frédéric was a stone structure, but its condition had nevertheless deteriorated by the onset of the French and Indian War (1754-1763). France's most significant stone stronghold was Fort Niagara.

The larger forts in North America defended strategically significant areas. Forts such as Ticonderoga and William Henry on the Lake George-Lake Champlain corridor guarded potential invasion routes. They served to delay, if not block, enemy incursions. Other strongholds like Fort Niagara stood watch over important positions. All of the supplies destined for France's Ohio Valley posts passed through Fort Niagara, and it also guarded the western approach to Canada. These defensive structures were usually built on the model of a European artillery fort, though they generally did not completely conform to the teachings of renowned military engineers like Sébastien Le Prestre, Marquis de Vauban. Vauban called for polygonal or star-shaped forts, but those in North America both French and British—were usually square in shape. The points of the star, called bastions, projected outward and created overlapping fields of fire, thus allowing defenders to batter attackers from several angles. The more bastions the fort had, the more obtuse the fort's angles became. Wider angles allowed multiple bastions to better cover any single point beyond the fort's walls. Connecting the bastions was the main wall, or curtain. Outside the fort were usually ditches, moats, palisades, outworks, or fortifications not attached to the fort's primary defenses. Some examples of this included Fort Duquesne, Fort Carillon, and Fort Frontenac (French), and Fort William Henry and Fort Edward (British). France's Fort St. Frédéric was roughly square, but with a tall citadel at one bastion. The British frontier garrison Fort Frederick was square but built of stone instead of timber.

Although most forts in North America were square, some were star-shaped or pentagonal as Vauban had suggested. The British posts Fort Ontario, Fort Pitt, and the fort at Crown Point were each star-shaped with five points. The British frontier base Fort Bedford was roughly pentagonal, with five bastions and some small outworks.

Some posts took irregular shapes that more closely followed the local terrain. The French island fort at Île-aux-Noix sat in the middle of the Richelieu River, just north of Lake Champlain. Its walls encompassed the island's perimeter, as well as a triangular fort near the southern end of the island. Chain booms stretched across the water to the opposite shores, blocking the passage of enemy vessels. Similarly, Fort Lévis was positioned in the St. Lawrence River to the southwest of Montreal. It too contained walls that surrounded the island, as well as an inner citadel. France built Fort Niagara on a triangular piece of land formed by the juncture of Lake Ontario and the Niagara River. Its landward side included a hornwork, which consisted of two demibastions, or half-bastions, connected by a curtain. In front of the hornwork were a ravelin, or triangular outwork, and V-shaped fortifications called redans. Within Niagara's outer wall was a wooden palisade that enclosed the main citadel.

Fortresses, which were the largest fortified places in North America, defended major population centers and strategic positions. A fortress was a fortified settlement that contained significant civilian as well as military structures. Although they existed primarily for defense, fortresses could serve other purposes. The Castillo de San Marcos, the Spanish garrison at St. Augustine, defended Spain's claim to Florida and protected a harbor in which friendly merchant and naval vessels sailing between Europe and the Caribbean could weather storms, refit, or take on new stores. Louisbourg had its own harbor as well. But it also protected French claims to the highly profitable fisheries off the coast in the North Atlantic, guarded the mouth of the St. Lawrence River from British vessels, and housed dwellings of the colony's governor and engineer. Although Louisbourg was the largest fortified place in colonial North America, it was still considered just medium-sized compared to its European counterparts. Quebec had two sections, Upper Town and Lower Town. Upper Town harbored the wealthier residents and the majority of the city's administrative and military structures, whereas Lower Town held mostly civilians' houses, taverns, and shops.

Every fortress in North America possessed stone walls with multiple bastions, but each also had some unique qualities. French engineers sought to make Louisbourg a solid stone fortress, but the moist, salty air prevented mortar from drying properly. These conditions helped to create walls that constantly required maintenance; engineers covered most of them with wooden planks. Quebec's west-facing wall contained four bastions, and terminated in a demibastion at its southern edge, which also contained a small citadel. Quebec's design left the city's Upper Town dominated by higher ground outside the walls from which enemy forces could fire down into the majority of the city. Where they existed at all, the fortifications outside the walls consisted only of shallow ditches, and the walls were not designed to allow cannon emplaced on them to fire out toward the plains beyond—they could only strafe attackers attempting to scale the walls. The Castillo de San Marcos, the

most significant Spanish fortification in colonial North America, had walls built of coquina. This soft sedimentary rock featured the peculiar but effective quality of absorbing solid shot fired against it.

Fort Algernon (Virginia)

Colonial Virginia fortification constructed in 1609 at Point Comfort (now known as Old Point Comfort), located at the bottom end of the peninsula between the York River and James River. Fort Algernon was described by a Spaniard in 1613 as a weak structure 10 hands high garrisoned by 25 soldiers and armed with four iron cannon.

Fort Algernon was constructed by John Ratcliffe, one of John Smith's rivals for power in the Jamestown Colony. Ratcliffe wrote to Lord Salisbury on October 4, 1609, explaining that 100 men were stationed at the falls of the James River and others were at Jamestown. He also informed Lord Salisbury that he was building a fort at Point Comfort. It was clear from the very early history of Virginia that Point Comfort was a key to the defense of the colony. Before his departure for Virginia in 1609, Thomas Gates, who became the colony's governor in 1611, received instructions to build a fort there to prevent attacks from hostile European powers.

The fort burned to the ground in 1612, and was halfheartedly rebuilt; however, after several years it fell into disrepair.

In 1630 the colonial government commissioned a new fort at Point Comfort, which was abandoned in the 1660s. The location was fortified again in the 18th century, when Fort George was built, and again in the 19th century, when Fort Monroe was constructed. Old Point Comfort is currently the location of the U.S. Army's Fort Monroe.

Fort Algernon illustrates two key themes in early American history. First, the English colonists viewed other Europeans as the biggest threat, not the native inhabitants. That would change in Virginia, however, with the native attacks of 1622. Second, attention and money were given to defense only when there was a perceived threat.

Fort Allen (Pennsylvania)

British fort erected in 1756 during the French and Indian War (1754–1763) under the direct supervision of Benjamin Franklin and situated at the present-day site of Weissport, Pennsylvania. Fort Allen was on the banks of the Lehigh River, immediately across the river from the Moravian mission of Gnadenhutten, which had been established as early as 1742.

The fort was a rectangular stockade 12 feet high, 125 feet long, and 50 feet wide. It was located 70 yards from the river. The post had a bastion on each of its long walls and two half-bastions on opposite corners, and was armed with two swivel guns. Within the walls were a 19-foot well (the Franklin Well), two barracks, and an officers' quarters. All the structures were made of logs.

After the construction of France's Fort Duquesne and the defeat of Major General Edward Braddock in his British expedition against that post in 1755, the Pennsylvania frontier was left vulnerable to the French and their Native American allies. In the autumn of 1755, numerous small Delaware war parties harassed the colony's northern frontier settlements in an effort to regain land they had lost 20 years earlier. On November 24, 1755, 12 warriors destroyed the Gnadenhutten mission.

Hoping to stop the Delaware raids and fearing that the French might also attack, on November 26 the Pennsylvania Assembly at the instigation of Franklin established its first colonial militia. It also appropriated £60,000 for the construction of forts along the Appalachian Mountains. This vote split the Quaker bloc, divided the Germans and the Quakers, and marked the end of the Quaker hold on Pennsylvania politics. Stockades were to be built at 20-mile intervals with blockhouses at five-mile intervals between them. Forty militiamen were dispatched to the Gnadenhutten site in December to protect the property and grain stores, but they too were routed by the Delawares.

On January 5, 1756, Gov. Robert Hunter Morris appointed Franklin the military and civil commander of the frontier. Commissioned a colonel, Franklin departed Philadelphia with 500 troops in February. Construction of Fort Allen was completed in about a week, although Franklin later questioned whether the name "fort" should be given to "so miserable a stockade."

Low on supplies and fearing retribution, the Delaware leader Teedyuscung arrived at Fort Allen in July 1756 to engage in peace negotiations with Governor Morris. The presence of the Delaware delegation, however, was unsettling to the civilian population, and the talks were relocated to Easton before Morris's arrival.

War tensions contributed to interethnic disputes at the post. Differences between German and Irish troops led to a mutiny at Fort Allen in August 1756. Isolation and heavy drinking were also problems. In 1758 the Pennsylvania Assembly established a provincial monopoly on Native American trade. Fort Allen was one of three sites selected as stores. However, the colony's short supplies of food and trade goods made the plan impractical at that time.

Fort Allen was garrisoned regularly until about 1761 and intermittently thereafter. It stood until at least 1780. Colonel Jacob Weiss of Philadelphia purchased the land in 1784. The only remnant of the fort is the Franklin Well.

Fort Among the Apalachicolas (Alabama)

Fortification in the Chattahoochee River Valley (modern-day Alabama), also known as Spanish Fort, built to project Spanish power and deter English trade in that area during the period 1689–1691. In 1689, Don Diego Quiroga y Lossada, governor of Spanish Florida, ordered troops to construct the Fort Among the Apalachicolas near the tribal villages. In doing so, he hoped to discourage English traders who often acquired deerskins from the Apalachicolas, whom

the English called the Lower Creeks. Quiroga also sought to keep the English from expanding into Spanish Florida.

Indeed, the Spanish attempted to secure alliances with the Apalachicolas. In contrast to the English, who used trade as a way to win Native American allies, the Spanish employed religion and military techniques to win over the natives. The Apalachicolas initially rejected peace efforts by missionaries and soldiers, preferring English merchandise to religious conversion. Despite Spanish threats and raids on four villages, some Apalachicolas continued trading with the English.

Desiring to purge the area of English traders once and for all, Governor Quiroga realized that a fort was needed to resist English encroachments. Thus, in 1689, he instructed Captain Enrique Primo de Rivera to direct Spanish workers and Apalachee carpenters from the San Luis mission to construct and man a fortification near the Apalachicolas' villages. Using indigenous supplies, the men fashioned a fort resembling St. Augustine's Castillo de San Marcos. The fort included a stockade, blockhouse, guard posts, and a protective parapet constructed of dirt. It was rectangular and measured approximately 62 feet long by 53 feet wide. It also featured a waterless moat that was reportedly 11 feet across and 5 feet deep. Fully garrisoned, the fort was commanded by a Spanish lieutenant, assisted by a corporal, with about 40 men, including 20 Spanish soldiers and a like number of indigenous warriors.

The fort's commandant, Lieutenant Favian de Angulon, easily interacted with natives, giving them maize, livestock, and supplies. He told them that the Spanish were there to protect them from the English, whom he claimed often enslaved Native Americans. The Apalachicolas briefly allied with the Spanish because they feared retaliation for trading with the English.

The Spaniards' remote fort failed to impress the Spanish Court, and interest in it quickly waned. In 1690, many Apalachicolas, looking to continue trade with the English, left the Chattahoochee Valley, moving farther east, where English trading thrived unimpeded. Because of mounting threats against St. Augustine, Quiroga ordered the Fort Among the Apalachicolas destroyed in 1691. Soldiers demolished the fort, filled in the moat, and removed supplies before returning to San Luis and reinforcing St. Augustine.

Fort Amsterdam (New York)

Fortification located at the southern tip of Manhattan Island built by the Dutch in 1626. When the first Dutch settlers arrived at New Amsterdam, under the direction of Gov. Peter Minuit, they soon began to build a fort on Manhattan Island. This location afforded a wide perspective of the harbor and two rivers (the present-day Hudson and East).

The fort had been designed by the engineer and surveyor Kryn Frederick. One of its functions was to serve as a marketing tool to get more colonists to come to the settlement. Within the fort were located the Dutch Reformed Church (Gov. Willem Kieft had ordered it built within the fort's walls), government buildings, and quarters for soldiers. Outside the fort was a well and pump, the young town's sole water supply.

The first cluster of houses were nestled close to the fort, but the settlement soon grew and expanded northward. The Dutch West India Company had planned an impressive structure, but in reality the fort was rather simple. It was of square shape, with points at the corners. The walls were mostly earthworks, as a stone addition was never completed. Loose livestock were a problem because they often dug holes in the dirt walls, necessitating repairs on several occasions.

During Kieft's War, the fort served as a refuge for settlers from outlying areas fleeing Native American attacks. Under Gov. Petrus Stuyvesant, who took control of New Amsterdam in 1647, attempts were made to keep the fort in better repair. As British colonies were only a few hundred miles to the northeast, Stuyvesant was wary of

British attack. The settlers found that the fort offered little protection from native attack, and by the 1650s decided to erect a wall across the width of the island. However, the wall also soon fell into disrepair.

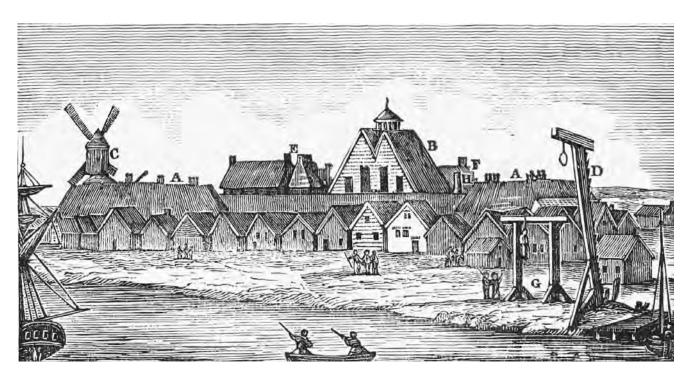

The British finally did sail into the harbor in 1664, and the city's defenses were shoddy at best. The fort was in poor condition, and the 1,500 citizens there (including 150 soldiers) did not believe they would stand a chance against the four well-armed British warships off shore. There were 600 pounds of powder stored within the fort, insufficient to overcome the 92 guns and 450 soldiers on the British ships. After a few days' standoff, the Dutch colonists decided to surrender to the British on September 8, 1664. On the surrender of Fort Amsterdam, the British took all of New Netherland. Not a single shot had been fired. The fort was renamed Fort James on its transfer to the English.

One reason the fort had such a small overall impact was the spread of colonists to Brooklyn, Queens, Staten Island, and the Bronx, as well as farther north on Manhattan Island. It had failed in its main purpose, to protect the settlers against the English, and it had also proven useless in protecting the citizens from marauding Native Americans. As the writer Washington Irving wrote in his satirical *Knickerbocker's History of New York*: "The mighty bulwarks of Fort Amsterdam frowned defiantly to every absent foe; but, like many a whiskered warrior and gallant militia captain, confined their martial deeds to frowns alone."

Fort Anne (New York)

The name Fort Anne collectively describes the numerous, distinct fortifications constructed during the late 17th and 18th centuries at the juncture of Wood Creek (which flows into the southern end of Lake Champlain) and Halfway Brook. This site was important as it protected the land route connecting the northern end of the Hudson River and the southern entrance to Lake Champlain. As such, it was key terrain for armies moving between French-held Canada and English New York.

During King William's War (1689–1697), the site of Fort Anne served as a staging area for abortive English attempts to invade Canada. In August 1690, Fitz-John Winthrop of Connecticut and a force of provincials and native allies occupied this area and constructed a fortified camp as they prepared to move on Montreal to support Sir William Phips's attack on Quebec via the St. Lawrence River. Winthrop's advance faltered as a result of disease, a shortage of boats, and inadequate native support. He withdrew to Albany, with the bulk of his army, leaving Captain John Schuyler to launch a raid against the outskirts of Montreal on August 23, 1690. In 1692, Winthrop again temporarily occupied the site and constructed an earthwork fortification.

From June to October 1709, during Queen Anne's War (1702–1713), Colonel Francis Nicholson used the site to attempt another invasion of Canada along Lake Champlain. As in 1690, this attack was to support a planned naval thrust up the St. Lawrence River. Nicholson constructed an earth and wood fort with either bastions or blockhouses on each corner and with barracks to protect the men and supplies being marshaled on Wood Creek. This fortification was known as both Queen's Fort and Fort Schuyler (in honor of Indian commissioner Peter Schuyler). When the naval attack on the St. Lawrence failed to materialize, and because he had difficulties keeping his force supplied, Nicholson withdrew, destroying the fort. He built a second fortification, named Fort Anne, on the same site in the fall of 1711 for another push up Lake Champlain. This operation, like the others, never moved beyond Wood Creek.

During the French and Indian War (1754–1763), the site was again fortified to include the construction of a stone powder magazine. During the American Revolutionary War, Britain's Lieutenant General John Burgoyne used the Lake Champlain–Wood

Creek–Hudson River route in his attack against Albany. After taking Fort Ticonderoga, approximately 30 miles to the north, an advanced element of his army skirmished with American forces near Fort Anne on July 8, 1777. After the engagement, the Americans retreated, burning the fort in the process. The Americans constructed yet another fort on this site after Burgoyne's surrender. It was destroyed, however, by a British raid in October 1780.

Fort Argyle (Georgia)

English fort constructed in 1733 on the west bank of the Ogeechee River, southwest of Savannah, Georgia. Fort Argyle was a key position within a network of frontier defenses designed to protect colonial Georgia from raids by Native Americans and the Spanish. In June 1733, soon after he arrived in Georgia, Gov. James Oglethorpe directed Carolina Rangers led by Captain James McPherson to establish a military post southwest of Savannah. The fort was built along a well-established trail used by natives that led from the interior of Georgia.

Named Fort Argyle after Oglethorpe's friend John Campbell, Duke of Argyle, the post served as a base of operations for colonial rangers and as a place of refuge for settlers in the region during two colonial wars. From their Ogeechee River base, the rangers at Fort Argyle patrolled the lawless frontier on horseback, on foot, and by boat.

Archaeologists have determined that there were at least three different structures built at the same site throughout the colonial period. The first, completed by McPherson in December 1733, was a small structure about 75 feet across with 6-inch-thick, 8-foot-high palisades with projecting corner bastions. It contained a two-story central blockhouse supported by wooden posts, a stable for 30 horses, and 12 crude wooden houses. The rangers also dug a 4- or 5-foot-deep moat around the perimeter of the stockade. By 1737, Fort Argyle reportedly was in a state of disrepair. During this period, an unknown number of civilian settlers and rangers endured a drab existence on the isolated frontier, exacerbated by

alcohol abuse, irregular pay, and the dangers of mosquitoes, alligators, and snakes.

Oglethorpe ordered the building of a second Fort Argyle, which was constructed in 1741. The fort's palisades were 11 feet high and formed a square enclosure measuring 110 feet on each side. Larger than the previous fort, it appears to have lacked the corner bastions and central blockhouse of the original. A barracks building with brick chimneys and at least two rooms was located along the eastern wall of the fort near the bank of the Ogeechee River.

Fort Argyle was never a battle site. In July 1742, during the Anglo-Spanish War of 1739–1744, however, it served as a refuge for women and children from the Georgia coast who had evacuated to avoid the fighting near St. Simons Island.

The third incarnation of Fort Argyle was constructed during the French and Indian War (1754–1763). This was the largest of the structures, with two rows of barracks designed to hold a contingent of 35 rangers charged with ensuring peace with the natives. After the peace of 1763, which effectively ended the Spanish threat when Spain ceded Florida to Britain, Fort Argyle lost its importance as a strategic location. The English abandoned it in 1767.

Fort Argyle fell into disrepair and did not play a role in the contest for Georgia during the American Revolutionary War. The military legacy of the fort continues today, however, as the site is located within the U.S. Army's Fort Stewart Military Reservation.

Fort at Number Four (New Hampshire)

Northernmost fort located on the Connecticut River in Charlestown, New Hampshire, which guarded the upper Connecticut River Valley in the mid-18th century. It was the target of numerous attacks by the French and their Native American allies. In 1743, in preparation for King George's War (1744–1748), Massachusetts decided to establish a fort at land grant Number Four (hence the name).

Kinship ties connected not only many people who moved to the fort, but also connected the settlers near the fort with other settlers farther south in the Connecticut River Valley. These connections were important because the fort was in an exposed area. Settlement along a river was desirable because of the fertile land, but the valley was a major invasion route for the French and their Abenaki allies.

As the northernmost fort along the Connecticut River, the fort suffered numerous attacks by the French and Indians from the moment people arrived in the area. A simple trip to work the fields, gather firewood, or fetch water could bring deadly attacks on the settlers. During the spring and early summer of 1746, the fort successfully defended against several large-scale attacks. However, because of the difficulties created by the frequent attacks, it was virtually abandoned over the following winter.

In late March 1747, Captain Phineas Stevens led about 30 men back to the fort. Eleven days later, on April 7, 1747, the defenders were attacked in what was the beginning of a three-day siege by 700 French and native allies led by Ensign Boucher de Niverville. Stevens and his men defended the fort so ably that Admiral Sir Charles Knowles, governor of Nova Scotia, sent his dress sword in honor of Stevens's defense. When the area was chartered as a town by the New Hampshire government in 1753, the inhabitants named it Charlestown in his honor. Despite deadly attacks on various settlers, the fort provided one of the few areas of relative security during the war.

In the period of relative calm between King George's War and the French and Indian War (1754–1763), hostilities did not end, but they were greatly diminished. The population grew, and more people began to settle beyond the boundaries of the enclosed fort. By 1754, there were 30 dwellings and about 180 settlers. Inhabitants also increased their trade with Native Americans. As Susannah Johnson, whose family ran a small trading establishment, wrote in her captivity narrative, "Every appearance of hostility at length vanished—the Indians expressed a wish to traffic, the inhabitants laid by their fears."

This calm was shattered by the start of the French and Indian War in 1754. Although only several people from the fort were killed during the war, this time there were far more settlers taken captive by the Native Americans, especially those in the town of St. Francis, or sold to the French who held them for ransom.

During the war, English soldiers going to or from the front often stayed at the fort. Although Massachusetts had been responsible for manning the fort despite its location in the province of New Hampshire, in 1757 New Hampshire began to take over the costs of supplies and troops for frontier protection. Yet troops from other provinces still provided protection. During the winter of 1758–1759, the fort was garrisoned with about 100 soldiers from New York; in late spring, they were replaced by a company of Massachusetts soldiers. In 1759, Robert Rogers and what remained of his rangers limped into the fort after their destructive attack on the Abenaki village at St. Francis.

In 1759–1760, the British military constructed a road from the fort to Crown Point. The road increased the importance of the Fort, but decreasing military tensions ended the fort's raison d'être. After 1760, it quickly fell into disrepair. Although Charlestown was the gathering point for those who marched to fight at the Battle of Bennington in 1777, it was the town and not what may have remained of the fort that was the focus. The end of the need for a fort meant that the area was now safe for habitation.

Fort Augusta (Georgia)

British military outpost erected in 1737–1738 at the falls of the Savannah River in Georgia and abandoned in 1767. In 1736, the governor of the colony of Georgia, James Oglethorpe, ordered the construction of Fort Augusta with the twin aims of defending Georgia's northern frontiers against French-led native attacks and increasing his colony's oversight of the Anglo-native deerskin trade, then based in New Windsor on the South Carolina side of the Savannah River. Construction began on the fort in 1737 under Captain Roger Lacy but was not completed until 1738, under Lacy's successor, Lieutenant Richard Kent. Although no plan of the fort survives, recent research provides a reasonable approximation of Fort Augusta's appearance. It was apparently a wood palisade fort, measuring 110 feet square, with bastions at the four corners.

From the outset, however, settlement at Augusta expanded to the north and west of the fort, rendering the structure all but obsolete for its original strategic purposes. Its garrison, usually comprised of between 10 and 30 provincial rangers, assisted military campaigns in other parts of the southeast, such as Oglethorpe's Florida campaigns in the 1740s and South Carolina's Cherokee campaigns in 1760–1761. Frequently in disrepair, Fort Augusta provided little in the way of defense, but it did serve as a refuge for outlying settlements when Anglo-Creek relations soured in 1756 and when South Carolina settlers fled Cherokee attacks in 1760.

These two latter events prompted the rise of Augusta's primary defense system of fortified private homes, mostly belonging to leading merchants in the deerskin trade and garrisoned by the local militia. Armed with small cannon and firearms, these houses likewise served as refuges in time of crisis. The defense of Augusta also benefited from a small band of Chickasaws who had resided in Savannah since the late 1710s, and who joined scouting parties during the Cherokee War. In the aftermath of the French and Indian War (1754–1763), Britain's Major General Thomas Gage ordered that Fort Augusta be abandoned, which occurred in 1767.

Fort Augusta (Maine)

A fortification built in 1718 and situated at Small Point Harbor (modern-day Phippsburg), Sagadahoc County, Maine (then part of Massachusetts). Following the Treaty of Utrecht (1713) and subsequent agreements with Native Americans of the region, settlers began returning to the large stretches of Maine that had been abandoned during decades of wars with the French and especially with the Abenaki tribe. The colonial government of Massachusetts chartered land companies and encouraged settlement of the northern frontier in order to establish a defensive line as far as possible from Boston. The Abenakis, however, resented the fact that the French had ceded Abenaki territory to the English and especially resented the establishment of English settlements where none had existed before the wars. In this resentment they were encouraged by officials of New France and especially by Sébastien Râle, a Jesuit residing in the Abenaki village of Norridgewock. They questioned whether Maine was part of Acadia, the territory France ceded to Britain in 1713.

In 1716, the Pejepscot Proprietors (a Boston-based land company) established a fishing village known as Augusta (not the present-day city of Augusta) at Small Point Harbor. Oliver Noyes, one of the proprietors, was the principal director and patron of the settlement. In 1718, as tensions mounted, Noyes ordered the construction of Fort Augusta as a defense against possible future native attacks.

The diamond-shaped fort was built of stone on a commanding knoll near the shore. Each of its four walls was 50 feet long. Diamond-shaped flankers, 12 feet on a side, projected from the east and west corners. The wall nearest the water had a gate. According to Captain John Penhallow, it was "ye best in ye province save Castle William."

Following the fort's construction, the General Court of Massachusetts then dispatched a small detachment of soldiers under Penhallow to garrison it. Eventually, however, the troops were redeployed to points farther east. Believing themselves abandoned by the government, the settlers also left after the outbreak of Dummer's War in 1722.

Fort Augusta (Pennsylvania)

Military post and trade center located on the Susquehanna River at Shamokin (present-day Sunbury), Pennsylvania. The fort was built between 1756 and 1758 and was the largest in eastern Pennsylvania. Gov. Robert Hunter Morris planned Fort Augusta as a mustering point for loyal Native Americans. Once royal commissioners approved the plan and Pennsylvania's legislature appropriated £2,000 to construct the fort, the governor instructed Colonel William Clapham to raise a regiment of 400 soldiers. Clapham's unit began construction in 1756 and had largely completed the fort by July 1757. The next year, 1758, his successor, Colonel James Burd, improved the installation.

Fort Augusta was situated on the Susquehanna River's eastern shore, south of the confluence of its North and West tributaries. Situated in advance of settlements, its cannon commanded the water outlets and river itself, through interdiction of shore and stream approaches downward. Enemy onslaughts west of the Susquehanna River provided argument for a defense of strategic Shamokin.

Fort Augusta was square in shape and furnished housing for up to 400 soldiers. Bastions covered the corners and its sides measured 204 feet. Its armaments consisted of 12 cannon, 7 blunderbusses, and 2 swivel guns. Outside the bastions nearest the river, a staked fence reinforced by blockhouses ran all the way to the riverbank. Governor Morris christened the post in recognition of Princess Augusta, the deceased Prince of Wales's widow and the mother of King George III.

In November 1756, in the Second Treaty of Easton, Gov. William Denny of Pennsylvania guaranteed to Delaware chief Teedyuscung the establishment of a trading post at Fort Augusta, one of three established by the province. This was to placate Teedyuscung for grievances with both New Jersey and Pennsylvania officials over land taken from the Delawares. Appointed by Denny in October 1757 as temporary trade agent, John Carson began selling merchandise at Fort Augusta that December. In June 1758, Nathaniel Holland took over as permanent trade agent. Despite Native Americans' accusations against Holland for price gouging, the post stayed open at the natives' insistence until 1763.

As with other forts on the northeastern Pennsylvania frontier, Fort Augusta experienced little hostile contact. Placed to block the Susquehanna River's passages and to deter Native American movements southward to Lancaster and Berks counties, the garrison suffered few casualties. When Pontiac's Rebellion began in 1763, Fort Augusta regained its military significance and it was garrisoned by Pennsylvania forces until 1765. It also saw some service during the American Revolutionary War.

Fort Barnwell (North Carolina)

Military post built in April 1712 during the Tuscarora War (1711–1713), located in eastern North Carolina on the Neuse River, some 20 miles northwest of present-day New Bern, North Carolina. During the Tuscarora War, colonial officials in South Carolina dispatched Colonel John Barnwell to North Carolina. Barnwell departed with a contingent of 500 troops, many of whom were native warriors. Barnwell's mission was to aid the besieged North Carolinians and drive back the Tuscaroras.

Arriving close to New Bern in late January 1712, Barnwell instructed his men to erect a fortification along the Neuse River. It would be used chiefly as a headquarters for local forces. Fort Barnwell was not particularly well fortified, which reflected its role as a headquarters and staging area rather than a full-fledged defensive bulwark.

Probably composed chiefly of earth and small logs, the hastily built structure was triangular in shape with walls roughly 180 feet long. There was probably at least one bastion in one of the corners. It is not known what types of cannon, if any, were employed there.

Barnwell intended on taking the fight directly to the Tuscaroras. His choice of location for Fort Barnwell makes this abundantly clear. Indeed, it was only seven miles from Hancock's Fort, where the Tuscarora chief resided.

Following a series of stunning successes against the Tuscaroras and believing the war to be over, Barnwell returned to South Carolina. Fighting flared up again in the late fall of 1712, however. For the remainder of the war, Fort Barnwell served as a headquarters. It was also likely employed during the Yamasee War (1715–1717).

Fort Barrington (Georgia)

British fort in Georgia. Constructed in 1760, Fort Barrington was situated on the northeast side of the Altamaha River near the well-traveled Native American trade route between the Carolinas and Florida. The structure was 12 miles northwest of the town of Darien in what is now McIntosh County, Georgia.

Fort Barrington was constructed to secure key trading routes from attacks by natives or rival Europeans. The nearby trails also served the British as a military road for moving troops to strategic areas. Fort Barrington was named in honor of Lieutenant Colonel Josiah Barrington, a prosperous Georgia landowner and a close friend of James Oglethorpe, Georgia's founder.

Fort Barrington was probably designed by the royal surveyor general for the southern colonies, William Gerard De Brahm, whose detailed drawing of the fort clearly identifies its characteristics. It was square in shape with stockaded walls made of puncheons, or split logs, for protection from small-arms fire. There were four corner bastions with elevated and protected sentry boxes for lookouts. In the center was a fully enclosed two-story blockhouse with a cupola-like lookout tower on the roof. The blockhouse served as officers' lodgings, a storehouse, and a magazine. Fort Barrington had sleeping areas for 48 men, a well, a baking oven, and necessary houses.

Lieutenant Robert Baillie built the post and garrisoned it with 25 rangers in 1761.

The rangers at Fort Barrington conducted several operations suited to their organization and mobility, which included enforcement of colonial laws on the frontier. In November 1765, they were ordered to search for a "nest of villains" near the Canoochee River. In December 1765 they left Fort Barrington to pursue and capture three runaway slaves who had killed a Creek native near the Satilla River.

In 1773, well-known naturalist and botanist William Bartram visited the site and noted the remnants of a nearby ancient native village. Fort Barrington played a role in the American Revolutionary War, when it was renamed Fort Howe by the British, though the site changed hands numerous times between Patriot and Loyalist forces. Fort Barrington was abandoned after the war.

Fort Beaufort (South Carolina)

English-built fort located south of Beaufort, South Carolina, erected in 1715 during the Yamasee War (1715–1717). On April 15, 1715, the Yamasee tribe launched a broad offensive against South Carolina settlements. Their goal was to drive the English out of the area completely. They were soon joined by other southeastern tribes, including the Creeks. In response to what was near-panic among the settlers in coastal South Carolina, colonial officials ordered the construction of Fort Beaufort (also known as Port Royal Fort).

Construction began sometime in the late spring of 1715. A small militia unit was stationed at Fort Beaufort into early 1716, when two scout boats were added to its defenses. Their mission was to interdict any native attempt to assault Beaufort by water.

The Yamasee War wound down by mid-1716. Nevertheless, colonial officials continued to man Fort Beaufort in an effort to guard against possible attacks by the Spanish and Native Americans. The precise location of the post is still disputed among historians and archaeologists. It was built either at Spanish Point, south of Beaufort (and later the location of Fort Lyttelton), or farther south still in modern-day Port Royal, South Carolina. Fort Beaufort was allowed to deteriorate to such an extent that it was substantially rebuilt in 1724. The second iteration of the post was likely a palisaded structure with either earthen walls or walls made of tabby (a mixture of lime, water, and oyster shells). Between 1721 and 1728, a regular British Army infantry unit—the Independent Company of Foot—occupied the fort on three occasions. Fort Beaufort was torn down in 1733 and was replaced by Fort Prince Frederick the following year.

Fort Beauharnois (Minnesota)

French fort, mission, and trading post built in 1727. Fort Beauharnois was situated on the west shore of Lake Pepin (an expansion of the Mississippi River on the Minnesota-Wisconsin border), about two miles from modern-day Frontenac, in Goodhue County, Minnesota. The original fort was probably on Sand Point, a waveformed spit of sand and gravel jutting into the lake. The fort was a square stockade, 100 feet long on each side and 12 feet high, with two bastions. Within the palisade were log structures for the commandant, the mission house, and the chapel. Quarters for the enlisted men were located outside the stockade. The fort was named for Charles de la Boische, Marquis de Beauharnois, governor-general of New France.

The mission to the Sioux peoples, named for Saint Michael the Archangel and led by the Jesuit Michael Guignas, was the first in Minnesota. In June 1727, the Compagnie des Sioux was formed and granted a three-year monopoly on the fur trade with the Sioux in order to finance both the mission and the fort. The purpose of the operation, however, was to attach the Sioux to the French cause and to gain intelligence on possible routes to the Pacific Ocean.

Fort Beauharnois was founded on September 18, 1727, by René Boucher, Sieur de la Perrière. The site proved problematic when the lake level rose and the fort was flooded with three feet of water in

April 1728. The hostility of the Fox tribe, which incited the Sioux to join them, forced the fort's abandonment in October 1728. The fort was rebuilt on a higher spot near the original location in 1732, and trade was conducted there for a number of years. In 1737, however, Sioux hostility again led to its abandonment. The fort was rebuilt yet again in 1750 but then abandoned in 1756, when the garrison was called away for service in the French and Indian War (1754–1763). The *coureurs de bois* (French woodsmen) and other fur traders continued to frequent the site, but Fort Beauharnois had failed in the intended goal of winning over the Sioux to New France or helping to find a way to the Pacific.

Fort Beauséjour (Nova Scotia)

Garrison built by French troops between 1750 and 1752 to command the western edge of the Chignecto Isthmus on the western bank of the Missaquash River in Canada. Since the 1713 Treaty of Utrecht, the Chignecto Isthmus had been contested territory. The British claimed to have received control over the area—which links present-day Nova Scotia and New Brunswick—along with the colony of Acadia, but the French argued that it remained under the sovereignty of New France.

In 1749, French officials in Canada relocated the mission of the Jesuit Jean-Louis Le Loutre to Point Beauséjour, ordering him to gather both his Micmac followers and local Acadians to form a new village. When a British attempt to rout the newcomers was thwarted in April 1750, work began on a fort. With the British building Fort Lawrence to the east, just across the river, French and Acadian workers toiled, according to one officer, "to check the English, who were advancing... more and more on Canadian territory." The result of French labors was a pentagonal stone breastwork encircled by a six-foot-deep fosse. Manned by Canadian regulars and supplied by the Acadians who lived outside its walls, Fort Beauséjour became France's easternmost stronghold on the North American mainland.

In 1754 Britain and France renewed hostilities in North America in the French and Indian War (1754–1763). In 1755, Gov. Charles Lawrence of Nova Scotia, who had led the unsuccessful 1750 assault on Chignecto, became privy to British plans to conquer Fort Beauséjour. As the bulk of British forces attacked Crown Point, Niagara, and Fort Duquesne, a joint Anglo-American force was to lay siege to Beauséjour. Led by Colonel John Winslow of Massachusetts and Lieutenant Colonel Robert Monckton, the attack on Fort Beauséjour began in June 1755. Aided by information passed on by the fort's

French commissary, Thomas Pichon, the siege lasted less than two weeks. The French commander capitulated on June 16, after a British mortar shell broke through the roof of a subterranean casement, killing an officer, a prisoner, and 2 other men. Some 300 Acadians were found within the fort's walls, leading to the charge that they had taken up arms against the British. Although the idea of removing the Acadians from Nova Scotia had circulated since the 1720s, their presence at Fort Beauséjour provided justification for Lawrence's stunning decision to carry out the forced expulsion in 1755.

Renamed Fort Cumberland, the installation was used by the British throughout the remainder of the French and Indian War. Led by the French officer Charles des Champs de Boishébert, some Acadians who had escaped to the St. John River during the 1755 expulsion participated in unsuccessful attempts to retake the fort. Following the French and Indian War, Fort Cumberland moldered for a decade, only to be attacked by rebelling colonists and disgruntled Native Americans in 1776. Their ill-considered assault failed, leaving Nova Scotia in British hands for decades to come.

Fort Bedford (Pennsylvania)

Pennsylvania frontier fort constructed in 1758 astride a branch of the Juniata River at a gap through southwestern Pennsylvania's Allegheny Mountains. Fort Bedford served as the eastern terminus of the Forbes Road, a 90-mile military road that supported Brigadier General John Forbes's British Army operations against French-held Fort Duquesne. The site was known as Raystown, after John Ray's trading post. In 1755, Pennsylvania colonel James Burd cut a road from Carlisle through Raystown to support Major General Edward Braddock's 1755 offensive against Fort Duquesne. However, construction stopped following Braddock's defeat.

In June 1758, nearly 2,500 British and provincial troops under Colonel Henry Bouquet began construction of the fort, storehouses, a hospital, and a military road westward. Named for the Duke of Bedford, the pentagonal log stockade enclosed roughly one and a half acres. The soldiers also constructed six entrenched camps nearby for the gathering forces. By September, nearly 4,000 troops

were encamped around the post. The fort's storehouses contained sufficient provisions to sustain 6,000 men for at least three months. After the British seized Fort Duquesne that November, Fort Bedford remained an important supply link for maintaining the now-renamed and newly constructed Fort Pitt on that same site.

During Pontiac's Rebellion in 1763, the fort and its token garrison provided refuge for local settlers. They also helped supply Bouquet's successful relief of Fort Pitt and his Ohio expedition the following year.

The British maintained a small presence in the area through the late 1760s, but they could not effectively police the frontier. Pennsylvanian vigilantes, the so-called Black Boys, often harassed garrisons along Forbes Road, faulting them for inadequately regulating Native American trade. Following the arrest of several members of the Black Boys in September 1769, James Smith and 18 followers captured Fort Bedford by overwhelming a sentry as he opened the fort's gate. The attackers then seized the garrison's stacked arms, freed their compatriots, and fled. Despite his numerous illegal activities, Smith routinely escaped punishment thanks to sympathetic juries. In any case, by the early 1770s the British had abandoned the post.

Fort Biloxi (Mississippi)

French fortification on the Mississippi Gulf Coast, designed to guard the mouth of the Mississippi River from rival traders and claimants and to strengthen alliances with Native Americans. Constructed in

Map of Fort Biloxi, Mississippi, ca. 1721. (Library of Congress)

1699 on Biloxi Bay at the site of present-day Ocean Springs, Mississippi, Fort Biloxi is the commonly used name to refer to Fort Maurepas, named for French minister of colonies Jérôme Phélypeaux de Maurepas, Comte de Pontchartrain. Settlers adopted the name Biloxi from the local Biloxi tribe.

After the death of Fort Biloxi's commander, Antoine Le Moyne de Sauvole de la Villantray, soldiers tore down the fort in 1701 and transferred to Fort Louis in Mobile Bay, which had better facilities for transportation, military maneuvers, and trade with both the natives and Europe than the fort at Biloxi.

In the early 1720s, the French planned to build a new fort and town on the opposite shore from the first fort's site on Biloxi Bay. However, insects and heat tormented builders, stopping the new fort's construction and preventing New Biloxi from becoming the colony's capital at the time, which was established instead at New Orleans. A replica of Fort Biloxi is located in Ocean Springs.

Fort Buade (Michigan)

French redoubt also known as Fort de Buade, located on the north bank of the Straits of Mackinac and built in 1689. The first settlement in the area was St. Ignace, a mission built by Father Jacques Marquette in 1671. Because of its location, St. Ignace was an important gathering point for Ottawas, Chippewas, Hurons, and fur traders in the region.

The first military post was built at St. Ignace about 1680. It had a garrison of 30 soldiers led by Greysolon Dulhut. By 1689, however, this outpost had been replaced with a palisaded fort named Fort de Buade, named for the governor of New France, Louis de Buade, Comte de Frontenac. The new fort was commanded by Louis de La Porte de Louvigny and garrisoned 150 French Canadian soldiers. The need for new fortifications arose partly because English fur traders had ventured into the area, but also because of the outbreak of King William's War (1689–1697).

In 1695, Antoine de la Mothe Cadillac replaced Louvigny as commandant, but his tenure was short lived. The following year, concerns over an oversupply of furs led King Louis XIV to order a halt to the fur trade in the upper Great Lakes. Cadillac obtained permission to abandon Fort Buade and establish a new post at Detroit,

named Fort Pontchartrain. Cadillac successfully convinced the Native Americans to travel to Fort Pontchartrain, leaving St. Ignace and Fort Buade to languish. The mission was also abandoned in 1705, when the missionaries returned to Quebec. Around 1715, a new fort, Fort Michilimackinac, was built on the south bank, opposite the deteriorating Fort Buade, in order to protect the straits.

Fort Bull (New York)

Fort in the British colony of New York protecting the portage between the Mohawk River and Oswego River. Built in October 1755, during the French and Indian War (1754–1763), Fort Bull was located at the west end of the portage road that connected the Mohawk River, which flowed east, and Wood Creek, which flowed west toward Fort Oswego. The road was called the Great Carrying Place by the Oneidas. Any supplies destined for Fort Oswego from the coastal part of the colonies had to use this road to reach Fort Oswego.

In March 1756, a force of 60 French regulars, 166 Canadian militiamen, and 136 natives led by Lieutenant Joseph-Gaspard Chaussegros de Léry snow-shoed to Fort Bull. On March 27, they demanded the surrender of Fort Bull. Its defenders promptly fired a volley to register their refusal. The French force then attacked the fort and within an hour had battered down its main gate. French-led forces stormed into the fort and killed almost everyone in sight.

Of the fort's 60 inhabitants, only a single woman and 2 soldiers were taken prisoner. The remainder was killed. Most of the killing inside the fort was the work of the French and Canadians, as only 6 of the more than 100 natives that accompanied them took part in the massacre. French loses were just 2 dead and 5 wounded.

The attackers destroyed the fort and buildings along with supplies destined for Fort Oswego, including gunpowder, ammunition, and provisions. The French also destroyed the horses, wagons, and boats used to transport the supplies. Loss of the fort made supplying the garrison at Fort Oswego much more difficult because the supply line had lost one of its key forts.

Fort Burd (Pennsylvania)

Pennsylvania post and supply station located at the fork of the Monongahela River and Nemacolin's Creek (now Dunlap's Creek). Constructed in 1759, the fort figured in military planning during the French and Indian War (1754–1763). Fort Burd, a British installation linked to the Forbes Road, was placed on a site once occupied by Captain William Trent of the Ohio Company known as Redstone Fort. It stood on a hill at the entrance of Nemacolin's Creek, about a mile from where Redstone Creek runs into the Monongahela River. As opposed to British major general Edward Braddock's disastrous strategy of moving deep into enemy territory, in 1758 Brigadier General John Forbes mounted a campaign of deliberate advance, safeguarded by fortified positions close to his advancing forces. Braddock's disastrous experience in 1755 had shown the disorder caused by a shortage of forts to which one might retreat following a defeat.

Fort Burd was erected in October 1759 by Pennsylvanian colonels James Burd and Joseph Shippen. The fort served as a fortified store-house and livestock pen and facilitated water passage to nearby Fort Pitt. Fort Burd was a sturdy stockade of square shape with curtain sides measuring 97.5 feet long. Its bastions included 30-foot fronts with 16-foot flanks. Inside the fort's walls, a magazine 39 feet square could accommodate local civilians in the event of an attack. Ringed by a moat and commanded by Virginia sergeant Angus McDonald, Fort Burd often attracted squatters to its environs. For lack of manpower, the British evacuated the garrison at the outbreak of Pontiac's Rebellion in 1763. In 1785 the settlement of Brownsville was situated at the spot of the former installation.

Fort Burke (Massachusetts)

Fort in Falltown (now Bernardston), on the Fall River in modern Franklin County, Massachusetts, built during 1744–1745. Fort Burke consisted of a square palisade, 99 feet long on each side and 12

feet high. There was an elevated watchtower at each corner. Within the palisade were eight buildings used as barracks and a blockhouse with two swivel guns. The intended garrison was 20 men.

The towns (or townships) of western Massachusetts had been settled after the end of Queen Anne's War (1702–1713), and in the case of Falltown in 1738. As tensions with France mounted once more, Gov. William Shirley of Massachusetts considered the settlements vulnerable to attack from Canada by way of Lake Champlain and Wood Creek. Thus, in 1744 and 1745 a series of forts, including Fort Burke, was built across the northern frontier of Massachusetts from Northfield, on the Connecticut River, westward toward the New York line. The garrisons were financed with the £100 that the Massachusetts General Court had granted each town on November 11, 1743, for the purpose of self-fortification. Fort Burke was constructed by Major John Burke, who was wounded during a native attack there in 1747. During the French and Indian War, area residents frequently sought refuge at the fort.

Fort Burlington Island (New Jersey)

Seventeenth-century Dutch and English trading post on the Delaware River. Located on an islet in the Delaware River a few hundred feet from the modern-day city of Burlington, New Jersey, 300-acre Burlington Island was formerly known as Matennecunk Island, Hooghe Island, or High Island. In 1624, the Dutch West India Company built a fortified trading post on the island and named it Fort Wilhelmus. Also called Verhulsten Island Fort, it was the first attempted European settlement in present-day New Jersey. It was also occupied by several Walloon families who had fled religious persecution in Belgium.

The director general of the settlement, Peter Minuit, established a successful fur trade with the local Delaware (Lenni Lenape) tribe. However, Minuit soon determined that Manhattan, along the Hudson River, would better serve Dutch trading operations and made it the capital of New Netherland in 1626. As such, nearly all of the families on Burlington Island were relocated by 1628.

Meanwhile, fur trading along the Delaware River moved to nearby Fort Nassau (modern-day Gloucester City, New Jersey), where the Dutch competed with the Swedish who had also settled along the river. Swedes displaced the few Dutch who remained on Burlington Island in 1656 and were replaced by the English in 1664. The Dutch regained control in 1673 but were again ousted by the English in 1677. The Quakers who settled Burlington City on the New Jersey shore opposite the island in the 1680s maintained a productive

trading relationship with the Native Americans, and used the island as a key trading location. By the mid-18th century, however, such trade had dissipated and the post was abandoned. Since the colonial period, the island has been used for farming, as an amusement park, a ferry landing, and for summer retreats.

Fort Carillon (New York)

See Fort Ticonderoga (New York)

Fort Caroline (Florida)

French-built military outpost first established in 1564 by René Goulaine de Laudonnière, an aide to Jean Ribault, and located on the south bank of the St. Johns River, roughly 10 miles to the east of modern-day Jacksonville, Florida. Fort Caroline was the site of the only French settlement in Florida. It was destroyed in 1565, when the Spanish killed its inhabitants and otherwise eliminated the French presence in the territory.

In 1562, the French Huguenot leader Ribault discovered the mouth of the St. Johns River and made plans to turn it into a French settlement. Two years later, Laudonnière returned to Florida and established a small settlement for Huguenot refugees near the mouth of the St. Johns River. The French named the settlement Fort Caroline, in honor of King Charles IX.

Constructed on the south bank of the river, Fort Caroline contained several palm-thatched buildings surrounded by earthen walls. Located on level ground to the west of St. John's Bluff, the redoubt's buildings were constructed to resemble the letter "A." The base of the "A" was oriented toward the river. The French dug moats along the fort's sides and erected a palisade that fronted the river. Facing south was a stone gateway of significant size.

Soon after the fort's establishment, Ribault returned to France to obtain additional supplies. While he was gone, Laudonnière and the approximately 400 inhabitants struggled to survive. They were unable to find gold or silver, and they could not provide for their own basic needs. The settlers survived largely as the result of the assistance of the Timucuan tribe, which supplied food in return for protection from the Spanish.

Spain, of course, had already laid claim to Florida and quickly deemed the Protestant Huguenots as a threat to its military and reli-

gious presence in the region. In August 1565, Pedro Menéndez de Avilés left Spain for Florida with five ships and about 700 men, hoping to beat Ribault and his supplies to Florida. However, storms slowed his progress and he did not preempt the Frenchman.

While Spain prepared to eliminate Fort Caroline, the French faced troubles in Florida when several residents tried to force the Timucuans into providing food and other supplies. As relations with the Timucuans deteriorated, so did morale in the colony. Threatened with starvation, the French settlers prepared to flee. Only the return of Ribault with supplies and additional soldiers prevented the complete abandonment of the colony.

Ribault and Menéndez had first confronted each other at sea on September 4, 1565. The French disengaged, and the two squadrons took different paths back to Florida. Ribault arrived at Fort Caroline first, and Menéndez landed at St. Augustine on September 8. The French prepared to attack the Spanish fleet, but a storm threw them off course and prevented the action. Menéndez's effort was more successful. Almost immediately after Ribault's arrival, Menéndez and his Spanish fleet confronted the French settlers. On September 20, 1565, with most of Ribault's supplies still on board the ships, Menéndez attacked the French at Fort Caroline. The French were outnumbered two to one, and the Spanish attack triumphed. The Spanish killed approximately 132 French settlers in the assault; another 45 escaped. Spain renamed the fort San Mateo.

In 1586, the French returned to Florida, and avenged their earlier defeat by burning the fort to the ground. They did not, however, attempt to rebuild Fort Caroline or colonize Florida again.

Fort Casimer (Delaware)

Dutch fort built in 1651, located on the Delaware River between Fort Elfsborg and the Swedish-held Fort Christina, which was seven miles downstream. The Dutch constructed the garrison in an attempt to control water routes to New Sweden. Petrus Stuyvesant ordered construction of the fort, which he personally supervised, using 200 soldiers. The fort was completed in short order.

Swedish engineer Peter Lindeström made drawings of Swedish and Dutch forts at Sand Hook in 1655. His renderings show the east side of Fort Casimer at 180 feet wide, with a gate. The fort's walls were 12 feet high, and two buildings are shown extending above the

Engraving by Theodor de Bry (after a painting by Jacques Le Moyne) of Fort Caroline, Florida, in 1564. (North Wind Picture Archives)

walls, one of them a two-story frame building with a large dormer window set into the roof. The post's main building was located along the west wall of the fort. This building housed the commander's office, and its window served as a lookout post. The second building was a square building with a tall conical shaped roof that may have been a magazine. Lindeström depicted the fort as square in shape with four large arrowhead-shaped ramparts. Firing platforms, fitted along each wall between the ramparts, doubled as the roof of various enclosed spaces within the fort.

Fort Casimer mounted a dozen 12-pounder iron cannon and one "brass" (actually bronze) gun. Although Stuyvesant had placed heavy weapons in the fort, he chose not to give the fort commander any means to use them, as the fort was supplied with neither gunpowder nor cannonballs. It had only 63 small lead balls for the brass gun and 1,000 musket balls.

Swedish governor Johan Classon Rising led an attack against Fort Casimer on May 1 (Trinity Sunday), 1654. The Swedes took the fort easily, as it had a garrison of only nine men and lacked gunpowder. Rising promptly renamed the post Fort Trinity, for the day on which it had fallen. He allowed Fort Casimer's Dutch residents to

either leave unharassed or to swear loyalty to the Swedish Crown and remain. Most chose to stay. Within a month, however, alarming reports reached Rising that Stuyvesant intended to retake the fort. In response, in early 1655, Rising decided to strengthen the fort significantly.

Rising's journal reports that his first decision was to construct a bulwark just outside the Dutch fort along the river's edge. This bulwark was a massive wooden structure built of two parallel log walls, 210 feet long and probably some 16 feet apart, set vertically like a palisade and located between the Dutch-built fort and the river. These walls were about 12 feet above the ground. A pier was erected extending out into the river from a landing at the top of the vertical log-wall structure. Next, a horizontal log edifice was added on top of the vertical log structure with a gun platform and firing ports for six cannon. This effectively made the structure into a blockhouse. Lookout platforms at the top of the walls were fitted at each end. Next, four 14-pounder cannon, probably of Danish origin, were taken from the ship *Örnen* (Eagle) and mounted in trenches. Lastly, low earthwork bulwarks with log curtain walls, soil ramparts, and fore trenches were added between the gun trench

and the river. This seems to indicate that Fort Trinity was never armed as designed because the cannon were not installed on the gun deck. There were now essentially two forts on one site.

In September 1655, during his expedition against New Sweden, Stuyvesant and his forces recaptured Fort Trinity, which became known again as Fort Casimer. That same year, the outpost became the center of Dutch authority in both New Jersey and Delaware. The fort and surrounding settlement fell under English control in 1664.

Fort Chambly (Quebec)

French fort constructed in 1665, situated on the Richelieu River north of Lake Champlain at the point where the rapids give way to navigable water stretching to the St. Lawrence River Valley. Initially, Fort Chambly was used to launch raids against the Iroquois Confederation, and it was the site of a consequential 1691 Iroquois defeat by French forces under Philippe Clément de Vuault, Sieur de Valrennes. Later, after the advent of peace between the Iroquois and the French in 1701 and with the imperial struggle against Britain just getting underway, Fort Chambly was employed primarily as a supply depot for key strongholds on Lake Champlain, such as Fort St. Frédéric at Crown Point. As with many French forts in the region, it also helped funnel Albany-bound furs toward the merchants of New France. Upgraded in 1709, Fort Chambly had become a square-shaped, stone structure with walls over 100 feet long and a bastion in each corner by 1711. It was then the largest fortification on the Hudson-to-Richelieu invasion route, and the last major line of French defense before Montreal.

Fort Chambly played an important role in quashing Anglo-American incursions against Canada in 1690 and again in 1691. Because of its commanding position at the foot of the Richelieu rapids, enemy troops moving downstream from Lake Champlain had to disembark and portage through swampy woods in order to pass. This gave the Fort Chambly garrison the option of engagement, which it exercised when Major Peter Schuyler of the Albany militia arrived on August 1, 1691, with 266 troops and 146 Mohawk and Mahican allies. Although the French suffered heavy losses in the engagement and their enemy was able to push on and raid La Prairie for the second time in as many years, the encounter at Fort Chambly helped ensure that the overall campaign fell far short of its original goal of the conquest of Montreal.

The last time in the colonial period that Fort Chambly would witness major military action came near the end of the French and Indian War (1754–1763). After Louis-Joseph, Marquis de Montcalm's, replacement as commander in chief of French forces in North America, Brigadier General François-Gaston de Lévis, failed in his bid to retake Quebec in the spring of 1760, three British forces began closing in on Montreal from the south, east, and west. The southern force, consisting of 3,400 troops under Colonel William Haviland with Robert Rogers's fabled rangers in the vanguard, took Fort Chambly on September 1, 1760, after a short battle with the French garrison, which numbered fewer than 100 men at that point. Haviland's forces then moved northward along the Richelieu and joined up with the forces of Major General Jeffery Amherst and Brigadier General James Murray, where they collectively encircled Montreal with 17,000 troops. Only one week after the fall of Fort Chambly the capitulation of Montreal occurred, presaging the official end of New France that came with the Treaty of Paris in 1763.

Fort Chambly would bear witness to conflict one additional time, during the American Revolutionary War, when it was taken by Patriot forces on May 17, 1775, and briefly occupied. A restored Fort Chambly stands today, part of a Canadian National Historic Site.

Fort Charles (Virginia)

Military outpost built about 1610. During 1610–1611, Sir Thomas Gates, governor of the Jamestown Colony, responded to the threat of Native American attacks by ordering that two small forts be erected near the coast. The forts, Fort Charles and Fort Henry, were named for the sons of King James I. They were situated astride the mouth of Hampton Creek, very near the modern-day city of Hampton. In 1611, English ship pilot John Clark described Fort Charles as being located half a league away from Fort Algernon on Point Comfort. It was garrisoned by 15 soldiers and boasted a single castiron cannon for defense against the natives.

In 1613, Don Diego de Molina, one of three Spaniards captured in 1611 who was held at Fort Algernon, described Fort Charles in a

letter as being half a league from Fort Algernon and a bit larger than Fort Henry. In 1614, Captain George Webb was the commander of both Fort Charles and Fort Henry. He wrote that their surroundings were commodious for the garrison, but noted that the forts were indefensible if they were to come under attack from European forces. By the 1630s, both Fort Charles and Fort Henry had been abandoned.

After a Native American attack on Virginia in 1644, however, Fort Charles was rebuilt at the fall line of the James River, where present-day Richmond is located. Construction was completed in 1645.

Fort Chartres (Illinois)

One of a series of forts built in what is now modern-day southwestern Illinois that served as the center of French military and civil activity in the Illinois Country from 1720 until 1765, when it was transferred to the British. The first fort was constructed on the east bank of the Mississippi River, 18 miles north of present-day Kaskaskia, Illinois. The fort served as both a base for trade and exploring expeditions and as the headquarters for the commandant of upper Louisiana.

In October 1718, Pierre Boisbriant was authorized by the Company of the Indies to construct a fort to protect the Illinois Country from the English and Spanish. A wooden fort was completed in the spring of 1720 and named Fort Chartres in honor of Louis, Duc de Chartres, son of King Louis XV of France. The fort became the seat of government for the Illinois Country while the territory remained under French rule. Fort Chartres offered a degree of protection from the Fox tribe for the French settlements of Prairie de Rocher, St. Philippe, Cahokia, and Ste. Genevieve. The fort was square, palisaded, made of wood, and featured two bastions and four curtainlike walls.

The original wooden fort fell into disrepair and was replaced in 1727. The new structure was much stronger than the original, with four bastions and walls that were double palisaded. The interior had a barracks, officers' quarters, a storage area, and a chapel. In 1731 the management of Louisiana was transferred from the Company of the Indies to the French government, and in 1732 the commandant of the fort constructed a new wooden fort farther away from the river. This too was abandoned in 1747, and the garrison removed to Kaskaskia. A fourth fort was begun in 1751 under the guidance of the French engineer Francois Saucier and was completed in 1760. Unlike the previous wooden forts, the new structure was built of limestone with four bastions connected by walls measuring 340 feet long, 3 feet wide, and 15 feet high. On completion, the

Plan of Fort Chartres, Illinois. (Library of Congress)

fort could house over 400 men, although the French never garrisoned that many soldiers at the fort.

After the French and Indian War (1754–1763), the French surrendered Illinois to the British according to the terms of the Treaty of Paris (1763). Two years passed before the British garrison arrived from New Orleans to occupy the fort because of hostile Native Americans in the region. On October 10, 1765, British troops of the 42nd Highland Regiment took possession of Fort Chartres and soon afterward it was renamed Fort Cavendish.

The British occupation of the fort resulted in a number of French settlers relocating west to St. Louis in Spanish Louisiana. The British continued to maintain a small garrison at the fort to protect their western territory from Native Americans and the French. The fort was extensively damaged in 1770 by a flood on the Mississippi River, and the British ordered it abandoned in late 1771.

Fort Chiswell (Virginia)

Fort constructed in the autumn of 1760 during the Cherokee War (1759–1761). Fort Chiswell was situated about eight miles east of present-day Wytheville in Wythe County, in the far southwestern corner of the present state of Virginia. It was named for Colonel John Chiswell, the owner of several nearby lead mines, and built by Colonel William Byrd III.

Byrd, commanding a Virginia militia regiment, had marched to the relief of Fort Loudoun (Tennessee), located at the confluence of the Little Tennessee River and Telico River. The Cherokees had been allies of the English, but a war party returning from service against the French and their Native American allies tried to supplement their war booty with horses from several Virginia frontier settlements. In the ensuing exchange of fire, several Cherokees were killed. Following this, another party had attacked other frontier settlements, and a general war against the Cherokees followed.

On August 8, 1760, the western Cherokees forced the surrender of Fort Loudoun, although its garrison was promised safe passage back to South Carolina. However, the retreating garrison was attacked two days later at Ballplay (Tennessee) by Cherokees hoping to avenge their earlier losses. Several Englishmen died in the skirmish. Byrd, whose mission was to relieve Fort Loudoun, arrived too late. The Cherokees posed a threat of more fighting to come. Thus, to position himself advantageously for a spring campaign, Byrd built Fort Chiswell as winter quarters. The garrison served as a post, arsenal, and supply depot until approximately 1790. Later that decade the property was sold.

Fort Christanna (Virginia)

Fort built in Brunswick County, Virginia, next to the Meherrin River, in 1714 in the aftermath of the Tuscarora War (1711–1713). During this time, Virginia was scrambling to protect its frontier from invasion by the Tuscaroras of North Carolina. Virginians also feared other tribes living to the north and west, who might side with the Tuscaroras. One solution to the dilemma was to unite the

Catawban speakers who resided in Virginia, including the Saponis, Occaneechis, and Stenkenocks. They agreed not to conduct raids on the English and to assist Virginia in defending the frontier against the Iroquois, who came down from New York, and the Tuscaroras, who were still a threat.

Construction on Fort Christanna was begun in August 1714 and represented the great ambition of Virginia's Gov. Alexander Spotswood, who supervised the building effort. The fort was large and built in a pentagonal shape with 300 feet per side. Its walls were made of log palisades, which connected five blockhouses. Each blockhouse contained five cannon for defense of the fort. Spotswood was so interested in the success of his venture that he built his residence not far from the fort. By this move, he hoped to coax settlers to move westward beyond Fort Christanna, thereby strengthening Virginia's frontier settlements.

In its heyday, Fort Christanna was a bustling community. Perhaps its most noteworthy facility was its Indian School, which was assisted financially by the Anglican Church's London-based Society for the Propagation of the Gospel. At its height, the school sponsored 70 Native American pupils. While there, the children were taught English and the Christian faith by schoolmaster Charles Griffin. Once the children completed their studies, they were expected to return to their respective communities and help spread European civilization.

The fort also served as home base for the Virginia Indian Company, a trading venture. This was yet another enterprise of great interest to Spotswood, and its presence made certain that Fort Christanna was a trade center. The company also distributed materials meant for defense of the frontier. The company built the Indian School and cut roads and erected bridges throughout the region, which was dotted by waterways. Spotswood thereby successfully fixed and regulated Virginia's Native American trade in one location.

Located between the fort and the Meherrin River was a Saponi village. Approximately 300 individuals from the Saponi tribe, and other tributary Indian groups incorporated with the Saponis, inhabited the village. The children who lived there entered the fort every day to study.

Virginia stopped funding the fort's maintenance in 1718; thus, the fort quickly fell into disrepair. Today the fort's ruins are located south of Lawrenceville, Virginia, in modern Brunswick County overlooking the Meherrin River. Excavations of Fort Christanna and the Saponi village began in 1979 and continue to this day. Indeed, archaeologists have found that the descriptions of the fort and the Saponi village made by John Fontaine in 1716 are accurate.

Fort Christina (Delaware)

Fort constructed in 1638 by the Swedes on the Delaware River (where modern-day Wilmington is located) and named for Queen Christina of Sweden. Fort Christina was built under the supervision of Peter Minuit, who had led the Swedish expedition to settle the area. Two ships, the *Kalmar Nykle* and the *Fogel Grip*, sailed from Sweden in 1637 and arrived on the Delaware River in the spring of 1638. A settlement site was quickly selected at a place called "The Rocks" (modern Wilmington). Minuit's expedition erected a wooden stockade immediately after arrival and, in just three months, the Swedes had completed basic construction on the fort.

The hastily built fort was a rough square shape because that was the easiest and most efficient shape to build. It also included arrowhead-shaped bastians on each corner. To fortify the post's 12-foot-high walls against cannon fire, dirt was piled against the outer wall so the palisade was not visible from the river. Its walls

Fort Christina, established in 1638 under the leadership of Peter Minuit, was the chief outpost of Swedish settlers in the Delaware River area. (Hulton Getty/Archive Photos)

protected living quarters, a magazine, a storehouse, and a barn among other outbuildings. Its permanent garrison was 3 men, but at times the temporary garrison was as large as about 40 men.

Because the stockade was 12 feet high, the men inside could not see over the walls to defend the fort. Thus, a firing platform was constructed around much of the palisade's interior. The platform allowed defenders to stand and observe activities on the river, and it served as the roof for many buildings within the fort's walls.

The local Native Americans, the Delawares (Lenni Lenape), were rarely much of a problem for the Swedes, who maintained good relations with them. The men of New Sweden were most concerned that Fort Christina provide them with adequate protection from their European neighbors, particularly the Dutch. Soon, the fort became a political and cultural center for New Sweden.

Be that as it may, the Swedes neglected to maintain the fort and allowed it to fall into disrepair. Indeed, only two years after it was built, the ramparts had begun to crumble. After hastily repairing the damage, the fort's inhabitants were forced to undertake a major renovation in 1644.

Notwithstanding this repair work, the Dutch captured Fort Christina in 1655. Petrus Stuyvesant and a force of seven ships and more than 300 infantrymen took the fort with no bloodshed and renamed it Fort Altena. In 1664, the English in turn invaded and took control of the fort. Some decades later, they dismantled the fort so that nothing of it remains above ground today.

Fort Condé (Alabama)

French fort on Mobile Bay near the Mobile River, built during 1710–1711. Fort Condé demonstrated the Louisiana colony's military strength along the Gulf Coast. The fort was originally named Fort Louis de la Mobile, but by 1724 it had been renamed Fort Condé de la Mobile to recognize French marshal Louis II de Bourbon, Prince de Condé, whose descendants lived in Mobile. The fort's soldiers conducted surveillance of coastal and river traffic and guarded the colony.

Fort Condé experienced many of the problems endured by its predecessor. Hurricanes battered the garrison, and storm surges piled sand in Mobile Bay's channel. Thus, officials wanted to prevent water and wind damage encountered on the coast. Workers rebuilt a smaller brick structure on the fort's stone foundation, using locally manufactured bricks, oyster shells, and lime (known as tabby). Strategic enhancements included platforms for gunmen, improved casements, and steeper sides. Unfortunately, bricks sometimes fell apart and the colony occasionally lacked sufficient funds and workers to reinforce Fort Condé as desired.

Many of Fort Condé's soldiers were poorly trained, but they were rarely confronted by human attackers. Mosquitoes and vermin, however, tormented the soldiers, who often suffered fevers and mosquito-borne diseases. Supplies, especially bedding, were frequently slow to arrive. And the hot, humid environment was miserable. As a result, morale among those stationed at the garrison was very low.

Under terms of the Treaty of Paris of 1763, France ceded Mobile to the British, who renamed its military installation Fort Charlotte to honor the British queen. The Spanish in turn captured it in 1780 during the American Revolutionary War. The United States seized the former Fort Condé from Spain in 1813, when it served as U.S. Army Major General Andrew Jackson's headquarters. By 1819, workers had razed part of Fort Condé and thrown the rubble into the surrounding marshes. A rebuilt Fort Condé is now a tourist attraction in modern Mobile, emphasizing the city's French colonial history.

Fort Conti (New York)

Colonial fort built in 1679 by the French, located on the eastern bank of the Niagara River where it flows into Lake Ontario, near modernday Youngstown, New York. Fort Conti was one of several forts built on this site, including Fort La Salle, Fort Denonville, the House of Peace, and Old Fort Niagara. Commanding the portage around Niagara Falls, the site controlled the Great Lakes route into the interior of the continent (the principal alternative to the Ottawa River route already controlled by the French). The location was a frequent point of contention, first between the French and the Seneca (Iroquois Confederation), then later between the French and British.

René-Robert Cavelier de La Salle may have built the first structure at the site, Fort La Salle, in 1669. This would have been a temporary structure for quartering during the winter, probably defensible against attack. Little, however, is certain about Fort La Salle's whereabouts. La Salle returned to the area in December 1678, intent on creating a personal fur-trading empire in the upper Great Lakes. He assigned his lieutenant, Henri de Tonti, to build a transport ship on Lake Erie and to build Fort Conti at the mouth of the Niagara River to protect vessels bringing supplies from the east. The fort was named for Tonti's patron, Louis Armand de Bourbon, Prince de Conti. Its construction began in January 1679.

Standing on rock bluffs 25–50 feet above the river, the fort consisted of two 40-foot-square log blockhouses connected by palisades. La Salle left a dozen men to garrison the fort when he ventured farther west in August 1679 and dispatched another squad in November. When he returned the following year, the fort had been destroyed, burned either by the Senecas or through the carelessness of the garrison.

In 1687 the new governor of New France, Jacques-René de Brisay, Marquis de Denonville, viewed the Iroquois Confederation as a threat to his province's security and to the upper lakes fur trade. In July he attacked the main Seneca villages, near the Genesee Valley. Then he proceeded to the Niagara River to claim the portage and to order the construction of Fort Denonville at the site of Fort Conti. The fort consisted of a stockade with four bastions enclosing eight buildings.

The governor returned to Montreal, leaving the fort and 100 men under the command of Captain Pierre de Troyes. That winter, the garrison suffered from cold, starvation, revolt, and scurvy, in addition to attacks by the Senecas. By April only 10 or 12 men remained at the site, and Troyes died of scurvy on May 8, 1688. The garrison was relieved, but the governor concluded that the fort was too distant and isolated to be maintained in the face of Seneca hostility. On September 15, 1688, the troops pulled down the stockade and abandoned Fort Denonville. The Senecas burned the remains.

In the early 1700s, when relations with the Iroquois had improved, the French determined again to consolidate control of the Great Lakes and to exclude the English from the fur trade. In 1720 Louis-Thomas Chabert de Joncaire, an adopted son of the Senecas, persuaded them to deny the English permission to build a fort on the Niagara while he built a trading post (the Magazin Royal, or royal store) at the Niagara Escarpment (Lewiston, New York). In 1726 Gaspard-Joseph Chaussegros de Léry, the governor's chief engineer, built a new fort in the guise of a trading post at the Fort Denonville site. He officially called it the House of Peace, but it was also the first to carry the name Fort Niagara. It was built in the style of a grand two-story house, 48 feet by 96 feet, with stone walls 4 feet thick and a surrounding stockade. Overhanging dormers on the second floor allowed defenders to fire down on attackers. With this, the French finally had a permanent fort at the mouth of the Niagara River. Later referred to as the "French Castle," the structure still stands.

During King George's War, the neutrality of the Iroquois kept the fort peaceful and its garrison did not exceed 30 men, but it was expanded and the stockade replaced. In the years preceding the French and Indian War, Fort Niagara was the base for the French expansion toward the Ohio Valley. The site was extensively reconstructed and enlarged in 1755–1756.

Fort Corchaug (New York)

Native American fort located in present-day Suffolk County, Long Island, New York, on the west bank of Downs Creek. The Corchaug tribe built this fort some time after the Pequot War (1636–1638). At that time, the Corchaugs occupied the north fork of Long Island from Orient Point to the Wading River.

The Corchaugs were part of a confederacy of four tribes occupying the eastern end of Long Island, led by the *sachem* (chief) at Montauk. The Corchaugs paid tribute to the Pequots until the Pequot War. Thereafter, they changed their allegiance to the English settlers in Boston. Indeed, they went so far as to send the heads of 60 Pequot refugees to Lieutenant Lion Gardiner at Fort Saybrook as proof of their allegiance.

Fort Corchaug served two primary purposes. It was a place of refuge not from Europeans but from the natives of New England who would come to Long Island to collect shells for making wampum. Archaeological evidence also suggests that the site was used as part of a wampum network that extended to New Amsterdam. The fort was in an oblong shape and was built with a palisaded perimeter approximately 210 feet in length (running north—south) and 160 feet wide (running east—west). It was likely further protected by an earthen berm running perpendicular to Down's Creek.

As the English established themselves on Long Island, the Corchaugs gradually lost their sovereignty. From 1648 to 1649, the Corchaugs sold much of their land to the newcomers and soon lost their autonomy. Some Corchaugs were enslaved, and many others died of disease. Fort Corchaug was abandoned in 1660.

The Downs family purchased the land on which Fort Corchaug stood in the early 1800s, and it was subsequently used for pasturing cattle. In 1935, archaeologist Ralph Solecki discovered the remains of the fort and then conducted an extensive archaeological survey on the site. In July 2000, the Peconic Land Trust purchased the site for \$1.2 million in order to preserve and study it.

Fort Crèvecoeur (Illinois)

The first French fort in the West, or Illinois Country, constructed in early 1680. René-Robert Cavelier, Sieur de La Salle, arrived in Canada in 1667 and became interested in the fur trade. In 1677 he returned to France to petition King Louis XIV for permission to explore the western part of New France to the Mississippi River. The king formally granted La Salle permission on May 12, 1678. La Salle was given five years to explore the territory and was authorized to construct forts wherever necessary. La Salle embarked from La Rochelle on July 14, 1678, with 32 men, including Henri de Tonti, a native Italian then serving in the French military.

After arriving in Canada, La Salle ordered a small ship, the *Griffon*, constructed on Lake Erie for the expedition. On September 18, La Salle sent the *Griffon* back to Niagara with a load of furs and orders to meet the expedition on Lake Michigan. Months later, when it failed to return, the ship was assumed lost. On January 5, 1680, La Salle's party arrived at the point where the Illinois River widens to form Peoria Lake and camped near present-day Peoria. The following day they encountered a Native American Illinois village where La Salle informed Nikanopy, brother of the chief, that he intended to erect a fort and build a canoe for descending the river. The two men agreed that the natives would provide food for La Salle's men in exchange for protection and trade.

The onset of winter prevented further exploration, so La Salle ordered the construction of a fort to shelter his men and protect them from the Iroquois. The fort was completed and occupied within a few weeks at this temporary location. It was protected on one side by the Illinois River, on two sides by deep ravines, and in the front by a hill reinforced by timber. An earthen embankment and a 25-foot-high, 12-inch-thick stockade wall made of pointed logs surrounded two long barracks and a cabin that also served as the chapel. La Salle named the post Fort Crèvecoeur, which means "heartbreak," in honor of Marshal Turenne's victory over the Dutch in July 1672. Tonti had served under Turenne during the battle at that Dutch stronghold.

In March 1680, La Salle returned to Canada for supplies and to determine what had happened to the *Griffon*. On arrival at St. Joseph, La Salle learned that the ship had disappeared and that a French ship carrying supplies for his expedition had also sunk. During his absence, La Salle left Tonti in command of Fort Crèvecoeur.

While Tonti was away on May 6, 1680, inspecting Starved Rock as a permanent site for a new fort, the garrison mutinied. The fort was completely destroyed, but the deserters, who threatened to murder La Salle, were captured. Fort Crèvecoeur was never rebuilt.

Fort Cumberland (Maryland)

Logistical base erected in 1755 for Major General Edward Braddock's 1755 Fort Duquesne campaign. Located in present-day Cumberland, Maryland, Fort Cumberland sat on a bluff northwest of the junction of Wills Creek and the Potomac River's north branch. Although the fort was in Maryland's western territory, the Maryland Assembly had little interest in supporting a post well beyond its frontier. Thus much of the fort's development fell to neighboring Virginia.

The site of the fort was originally an outpost of the Ohio Company of Virginia. In 1754, Lieutenant Colonel George Washington converted the storehouse at the site into fortifications in order to supply his ill-fated attempt to seize the Forks of the Ohio River, later dominated by France's Fort Duquesne. The post was known as the Wills Creek Fort or Fort Mount Pleasant, Virginia, but Lieutenant Governor Robert Dinwiddie renamed it Fort Cumberland in 1755 after King George II's son, the Duke of Cumberland. As part of a broader campaign against New France, the Virginians further expanded Fort Cumberland to support Braddock's army.

The main fort encompassed a log stockade, roughly 100 feet square, with four corner bastions. It mounted 16 cannon, mostly 4-pounders, and a number of swivel guns. Attached to the fort's eastern side stood a rectangular palisade about 300 feet long and 150 feet wide that enclosed a large parade ground and three barracks and storehouse buildings roughly 200 feet long. At the fort's eastern end, an angled bastion overlooked Wills Creek. The garrison also dug trenches to the creek to ensure a water supply. When fully garrisoned, there was sufficient room for more than 200 men.

Through spring 1755, over 2,000 regular and provincial troops and an abundance of supplies flowed into the fort. Braddock himself arrived there on May 10. Confident of victory, the army's vanguard departed on June 8. After a stunning defeat at the July 8 Battle of the Monongahela, Braddock's shattered force retreated to Fort Cumberland. The survivors, led by Colonel Thomas Dunbar, who succeeded the mortally wounded Braddock, reached the fort on July 17. Stragglers trickled in for more than a week.

Following Braddock's defeat, Fort Cumberland became the westernmost British outpost in the middle colonies. Despite gover-

nors' pleas to remain there, Dunbar withdrew on August 2, leaving behind a large number of wounded. Only two companies of Virginia and Maryland rangers remained at the fort, the latter denied pay by their own colony. Maryland's intransigence continued amid a debate over the fort's future. Maryland governor Horatio Sharpe believed that the exposed fort should be abandoned in favor of Fort Frederick, a post under construction nearly 60 miles down the Potomac. Virginia's military commanders also thought the fort was too distant from their settlements and stretched their resources too far without assistance from both Maryland and Pennsylvania. But neither colony provided aid. The Crown refused to abandon the fort, however. In 1757, British commander in chief John Campbell, Earl of Loudoun, ordered Maryland to garrison the post, but the Maryland Assembly refused to comply. Meanwhile, the Virginians remained, waiting in vain for the Marylanders. A small number of regulars soon supplemented their numbers.

Fort Cumberland did little to halt or deter French and native war parties, which often killed individuals within sight of the garrison. These raiders occupied ridges overlooking the Potomac Valley and fired down into the fort. The psychological effect of such sniping unnerved the garrison, although direct attacks were rare.

British brigadier general John Forbes's 1758 campaign against Fort Duquesne reignited debate over the fort's future. The Virginians argued for another advance using Braddock's Road and relying on supplies still stockpiled at Fort Cumberland. Pennsylvanians argued for a new route through southern Pennsylvania. Both proposals had as much to do with postwar economics as with current strategy. While Washington scouted and improved the Braddock Road, Colonel Henry Bouquet constructed the so-called Forbes Road through Pennsylvania. In July 1758, Bouquet ordered Washington to construct a 30-mile road linking Fort Cumberland with Fort Bedford, Pennsylvania. The Virginian mistakenly believed the army would gather at Bedford as a diversion and then march to Cumberland for the main attack against Fort Duquesne.

Forbes, however, selected the Pennsylvania route. For the first and only time, Maryland provided a garrison, freeing an embittered Washington and his Virginians to join the main army in Pennsylvania. After peace treaties with the western tribes and Forbes's capture of Fort Duquesne, Fort Cumberland's role became superfluous and it was soon abandoned. When frontier warfare reignited with Pontiac's Rebellion in the summer of 1763, the fort's remains became a sanctuary for local settlers. With the rebellion's end, the locals abandoned the site once again.

Fort Darby (Massachusetts)

The first fort constructed on Marblehead, a rocky peninsula on the Atlantic Coast of Essex County in northeastern Massachusetts. Fort Darby was situated on Naugus Head, a promontory on the northwest corner of the peninsula. Naugus Head and Winter Island, which was opposite, controlled the entrance to Salem Harbor. The fort's exact appearance is unknown.

Marblehead was settled in 1629 as a fishing community and an outpost of Salem; it became a separate town in 1649. Fort Darby was most likely built about 1630 at the behest of John Endecott, the acting governor of the Massachusetts Bay Colony until the arrival of John Winthrop. Its construction was hastened by concerns over the vulnerability of the young colony to pirates, privateers, and other foreign raiders. The fort was named after a similar headland in Derby (pronounced Darby), England. In 1673, when the arrival of a hostile Dutch fleet was feared, the fort's "great artillery" was made ready for use.

A breastwork (later Fort Sewall) was built on the northeast corner of the Marblehead Peninsula, possibly as early as 1634. It faced Marblehead Neck, a rocky promontory extending to the east from the main peninsula, and controlled the entrance to Marblehead Harbor. Another defensive position, on Winter Island, was built as early as 1643. A powder magazine was built in Marblehead in 1755.

Fort de la Boulaye (Louisiana)

The first European fort along the lower Mississippi River, established by Pierre Le Moyne d'Iberville in 1700. Fort de la Boulaye was situated on the eastern bank of the Mississippi, approximately 30 miles to the south of present-day New Orleans and 45 miles north of the mouth of the Mississippi. Although it existed for only six years, the outpost gave France control of the lower Mississippi River Valley and the capacity to expand north from the Gulf of Mexico while also expanding south

from Canada. The fort had a two-story blockhouse composed of mud and wood, which was encircled by a wooden palisade and a moat about 12 feet wide. The garrison also mounted a 4-pounder cannon.

D'Iberville coveted a French presence on the Gulf of Mexico and had already established a fort on Ship Island, southwest of Mobile Bay. In January 1699, he had sent his brother, Jean-Baptiste Le Moyne de Bienville, to explore the coast farther westward. On March 2, 1699, at Cabo de Lodo (Cape Mud), Bienville found the Mississippi River. After exploring up river, d'Iberville decided that its banks were too low and that marshes and mud flats might hamper large ships. He then built Fort Maurepas on the east side of Biloxi Bay and sailed for more colonists and supplies.

When d'Iberville returned, he ordered Bienville to build a fort on the first high ground upstream. Bienville built Fort de la Boulaye in 1700. As it turned out, the fort was too far inland to be truly effective and was poorly manned and supplied. Even worse, the flood-prone, mosquito-infested site could not sustain agriculture and threatened the French with yellow fever and other mosquito-borne diseases. They abandoned the fort in 1706.

Fort de la Presque Isle (Pennsylvania)

A series of forts built by the French, the English, and the Americans beginning in 1753 along the southern shores of Lake Erie, near the Presque Isle peninsula (now Erie, Pennsylvania). The name comes from *presq'île* (literally "almost an island"), the French word for "peninsula." François Le Mercier, a French engineer, erected the first French fort in 1753.

Le Mercier had been attached to the expedition sent to seize control of the headwaters of the Ohio River and prevent English encroachments into French-claimed territories. Presque Isle marked the beginning of a newly discovered route into the Ohio Country. As such, it guarded the supply route and communications to the interior. The expedition of about 1,500 men was under the overall command of Captain Pierre Paul Marin, an experienced officer who was then 61 years old.

Work on the fort began in late spring and was completed by June or July 1753. Located on an elevation overlooking the lake and peninsula, it consisted of chestnut logs laid horizontally and stacked 15 feet high. The fort was square, 120 feet long on each side, and contained four log houses, either one in each corner or one along each interior wall. There was a gate on the north wall, and

another on the south. The French cut a portage road from Presque Isle to Rivière au Boeuf (French Creek), where they established Fort Le Boeuf (Waterford, Pennsylvania). This gave them access by water to the Allegheny River and Ohio River.

Disease, however, cut the mission short. All but 300 men were sent back to Montreal. Marin himself died at Le Boeuf on October 29, 1753. The operation commenced again the following year, with a larger force under Captain Claude-Pierre Pécaudy, seigneur de Contrecoeur. This expedition established Fort Machault (Venango, Pennsylvania) on the Allegheny River and Fort Duquesne (Pittsburgh) at the Forks of the Ohio, giving rise to the French and Indian War.

When the French abandoned Fort Duquesne in 1758, some of its garrison withdrew to Presque Isle. The British feared that the French might try to retake the Forks of the Ohio from there or the other nearby forts. Indeed, a force of some 1,100 Frenchmen and 200 Native Americans descended from the upper lakes and gathered at Presque Isle for precisely that purpose. However, they were redirected to the north to assist with the defense of Fort Niagara. When Niagara fell to the English, its French defenders withdrew temporarily to Presque Isle. They then burned Fort de la Presque Isle in the second week of August 1759, and continued their retreat to Detroit. The first French fort built in Pennsylvania, Presque Isle was also the last to be abandoned.

English forces under Colonel Henry Bouquet occupied the site and constructed a new fort at or near the same location in 1760. The English fort was a palisade with a blockhouse in one corner that was supposed to be impregnable. Constructed of massive logs, the blockhouse had a projecting upper story. Openings in the projecting floors allowed soldiers within to fire downward on attackers who came too close. The blockhouse also had a bastion from which flanking fire could cover one or more walls. A sentry box stood at the top, from which water could be thrown on the shingled roof in case of fire. Gutters made of bark were arranged so as to disperse the water to every part of the roof, and green turf at the angles of the roof were to provide protection against fire arrows. The sentry box and the doors of the blockhouse were lined to make them bulletproof. Unfortunately, the ridge-like bank of a stream entering the lake about 40 yards away provided cover for attackers, as did the lakeshore on the other side.

In 1763, during Pontiac's Rebellion, the fort was not one of the major forts on which the English focused their defensive resources. Presque Isle was commanded by Ensign John Christie of the Royal American Regiment, who had under him some 27 men, including six Rangers he had commandeered from a passing detachment. On or about June 15, 1763, 200–250 natives (Ottawas, Ojibwas, Wyandots, and Senecas) arrived from the Detroit area. Many of these attackers were veterans of the French and Indian War. They proceeded to make use of the stream's bank and the lakeshore to approach the fort stealthily at dawn.

Storming the site, an advance group used the loopholes in reverse direction to pour gunfire and burning pitch into the blockhouse. They also made a shield from the walls of an outhouse. Others built makeshift breastworks of logs on the ridges, from behind which they shot musket balls and fire arrows and made preparations to undermine the blockhouse. By nightfall the defenders' water supply was spent. Fighting continued through the night, paused in the morning, and resumed in the afternoon of the second day. The blockhouse caught fire, but by then the defenders had dug an underground tunnel to a well and they managed to put it out. At midnight on the second day, a former Englishman among the Wyandots presented Christie with an ultimatum—surrender or be burned alive. Come morning, Christie surrendered the post. Presque Isle was the last of the British forts to fall in Pontiac's Rebellion. Despite the terms of surrender, the natives torched the fort. Most of the garrison were killed, although the Wyandots, less enthusiastic participants, turned Christie, four of his men, and a sergeant's wife over to the commandant of Detroit.

In 1795, the Americans built a blockhouse at Presque Isle Bay. This was a log structure with a square first floor and a projecting octagonal second floor. At about the same time, a town was established there as well.

Fort Denonville (New York)

See Fort Conti (New York)

Fort Detroit (Michigan)

French-established post founded in 1701 and located at the narrowest point of the Detroit River, near present-day Detroit, Michigan. At the turn of the 18th century, New France established several posts along the Great Lakes to expand and control the profitable fur trade with the Native Americans. One important location was a 27-mile strait cut by the Detroit River between Lake Erie and Lake St. Claire, which served as a gateway for the three western Great Lakes to Lake Erie and the St. Lawrence River. On July 24, 1701, a French expedition led by Antoine de La Mothe Cadillac selected a site for a fortified town, which he called Detroit, or "the city of the strait."

Cadillac scouted a 40-foot-high bluff on the western side of the river where he located a fort that occupied a square of about one acre. It boasted a stockade 12 to 15 feet high and was protected by a deep moat. Cadillac named the fort Pontchartrain de Detroit after Jérôme Phélypeaux de Maurepas, Comte de Pontchartrain, French minister of marine and colonies. Eventually, the name for the entire settlement evolved simply to Detroit.

The outpost at Detroit expanded with the increased demand for beaver furs. By 1750 the fort accommodated a population of almost 900 traders, soldiers, and merchants. Fort Pontchartrain served as a French logistics base and was used to project military power into the region to resist British encroachment, especially during the French and Indian War (1754–1763).

After the British captured Quebec in 1759, all French outposts in the Great Lakes region, including Fort Pontchartrain, became possessions of Great Britain. On November 29, 1760, Major Robert Rogers led a British force of 200 soldiers into Detroit to occupy Fort Pontchartrain. The British changed the name of the military-trading complex to Fort Detroit and began to implement their own brand of imperial control on the native and French inhabitants.

Captain Donald Campbell, the first British commandant at the fort, described the fort as being in good repair with two bastions pointed toward the river and one bastion covering the land approach. In the bastions were 3-pounder guns and several small mortars. There were 70 or 80 houses in the fort laid out in a regular street pattern. In 1762, Major Henry Gladwin replaced Campbell with orders from Major General Jeffery Amherst to stop providing gifts, especially military stores, to the regional natives. This caused much acrimony among the local tribes.

In May 1763, Ottawa chief Pontiac organized a coordinated rebellion to oust the British from the region. He hoped to take Fort Detroit by deception. However, Gladwin had wind of the plot, and to Pontiac's dismay, had formed the entire garrison on the parade ground, fully armed. His ruse foiled, Pontiac resorted to besieging Fort Detroit on May 10. The siege of Fort Detroit lasted several months as the British attempted to organize sorties to attack Pontiac's camps. The summer of 1763 was a bloody time at Fort Detroit for both sides. The blood-letting continued until October 31, when Pontiac notified Gladwin that he was abandoning the siege. Fort Detroit continued to serve as a British center of trade and military power for the remainder of the colonial period as well as during the American Revolution.

Fort Detroit (Michigan), Siege of

Start Date: May 7, 1763 End Date: October 15, 1763

The event that launched Pontiac's Rebellion, and the most prolonged and prominent military engagement on the American frontier in 1763. Led by Ottawa chief Pontiac, Ottawa warriors along with the Pottawatomies, Wyandots, and other Native American groups in the Great Lakes region besieged Britain's Fort Detroit for five months (May–October 1763). The largest garrison in the region with about 130 soldiers, Fort Detroit was also the only post west of Fort Pitt that withstood attempts to capture it. The engagement is also the only one in which Chief Pontiac is known to have participated directly.

On May 7, just prior to opening the siege, Pontiac attempted to take the fort by surprise. Detroit's commander, Major Henry Gladwin, had received warning of the attempt, and when Pontiac entered with some 300 warriors, the garrison was under arms, which induced the Ottawa chief to cancel his plans. When Pontiac returned on May 9, Gladwin forbade him to enter with anything but a small number of warriors. Ottawas then attacked the island in the Detroit River that held the fort's supply of cattle, killed several British soldiers and settlers outside the post, and began the siege.

Attacking warriors were armed with muskets, and at times brought the fort and vessels in the river under heavy fire, but they were never able to overwhelm the garrison by fire or assault. Conversely, the British, also armed with muskets, had in addition only a few small artillery pieces, and thus they lacked the firepower to disperse

Illustration depicting a meeting between Ottawa leader Chief Pontiac and Major Robert Rogers in 1763 regarding peace terms following the Native American siege of Detroit. (Library of Congress)

attacks. As a result, much of the fighting had a seesaw quality: Warriors made use of cover to approach and fire on the fort, sometimes constructing their own breastworks; in response, Gladwin sent out sorties to destroy these structures when warriors temporarily returned to their camps.

Native American efforts to cut off the garrison's supplies, which moved by water over Lake Erie and up the Detroit River, presented a greater threat to the British. On May 28, warriors intercepted a bateau convoy, attacking and capturing most of the men who had made camp for the night on the lakeshore (and who were at that time unaware of the hostilities at Detroit). At the end of June, the sloop Michigan, returning with supplies from Niagara, repelled a canoe-borne attack as it was making its way up the river, and then endured fire from native-constructed fortifications on a nearby island. A few weeks later Pontiac and his followers launched fireboats to try and destroy vessels anchored near the fort. In September, the crew of the schooner Huron engaged in hand-to-hand combat to defend the ship, which was also returning with supplies for the garrison. Beyond carrying supplies, the artillery support provided by the guns of the Michigan and the Huron provided additional motivation for Native American attacks on these vessels.

At the end of July, a bateau convoy arrived at Detroit with troops under the command of Captain James Dalyell, including a ranger detachment led by Robert Rogers. In the early morning of July 31, Dalyell led most of these troops out of Detroit to attack the natives' camp, resulting in the major field action associated with the siege. His foes were prepared for him, however, and warriors ambushed his force at what would later be known as Bloody Run. Of 247 British soldiers, 55 became casualties and approximately 100 were captured, with the remainder fighting their way back to the fort.

Hostilities lasted until October 15, when Pontiac abandoned the siege. By then, he had little choice, as his requests for assistance from the French in the Illinois Country had been denied, clashes had arisen among various Native American groups in his camp, and warriors needed to leave to pursue the winter hunt. Although tensions between Pontiac and the British would continue for some time, Detroit would no longer be threatened.

Fort Dickinson (Virginia)

English fort erected in 1756, under the supervision of Lieutenant Colonel George Washington. Fort Dickinson was the third in a line of forts constructed to provide refuge in case of French or native attack, and was located on the Cowpasture River on a site four miles below the present-day town of Millboro Springs and George Washington National Forest in Bath County, Virginia.

Prior to the French and Indian War (1754–1763), little had been done in Virginia and the other English colonies to erect fortifications, especially on the western frontiers. The English were generally unorganized, lacked engineers, and had given little thought to western defenses. The few fortifications that were available were in serious disrepair. The French, on the other hand, had a well-organized military system and a well-placed program of fort construction.

Early in 1756, in the midst of war, the Virginia colonial legislature finally appropriated adequate funds to erect fortifications. Most of the forts were small, stockade enclosures. They tended to differ from one another as a result of terrain and the judgment of the construction supervisor. However, none of the frontier forts could have resisted a direct military assault or cannon fire. Their principal function was to protect settlements from surprise raids and Native American raiding parties. Many were located near rivers because the settlers had advanced up the rivers toward the western mountains. These forts were usually bastion traces in the form of a square. Fort Dickinson, named for the early local landowner John Dickinson, most probably featured a wooden stockade and a blockhouse. For a time, the fort was garrisoned by 250 men. It was attacked by natives in 1756 and again in 1757.

Fort Dinwiddie (Virginia)

English fort built during 1754–1755 in the mountains of modern-day Virginia under the supervision of Lieutenant Colonel George Washington. In late 1754, Washington was put in command of building a line of forts to protect western frontier settlements from attacks by the French and their Native American allies during the French and Indian War (1754–1763). The first of these forts to be built was Fort Dinwiddie, begun in late 1754 and sited near the house of William Warwick in the bottomlands of the Jackson River

(on Meadow Lane Farm) near present-day Warm Springs in Bath County, Virginia. It was locally called Warwick's Fort and stood about 20 miles to the west of Fort Dickinson. Officially named for Lt. Gov. Robert Dinwiddie of Virginia, the fort was inspected by Washington in early 1755.

On September 6, 1755, Washington ordered Captain Peter Hogg to take command of Fort Dinwiddie, and on September 24, Washington instructed Hogg to add bastions and barracks to the fort, to clear a field of fire to the range of musket shot, to employ coopers, to secure provisions, and to make weekly and monthly reports. By 1756, the number of men garrisoned at Fort Dinwiddie ranged between 60 and 100.

Later in 1756, Washington placed Thomas Bullett, a surveyor of the region, in command of the fort and soon promoted him to captain.

Although little is known about the particular physical characteristics of the post, it did boast a covered log passageway linking the blockhouse to a natural spring within the structure's walls. For a time, Colonel William Byrd III was at the fort, which some then called Byrd's Fort. The fortification was in use until 1789.

Fort Dobbs (North Carolina)

Fort Dobbs was a fortification built to provide protection to the western frontier of North Carolina during the French and Indian War. The fort was situated in the western piedmont region some 27 miles west of modern-day Salisbury, North Carolina.

In 1754, conflict erupted between the British colonies and the French settlements in the Great Lakes region. British forces under Major General Edward Braddock sent to deal with the growing French presence met defeat the next year near the Monongahela River at the hands of the French and their native allies. This resounding British defeat was part of a growing conflict on the western frontier of the British colonies, where French and native raiding parties operated at will in the areas along the Appalachian Mountains. A number of refugees, seeking to avoid the growing fighting, moved southward along the Great Wagon Road to the western region of Piedmont, North Carolina.

In 1755, the threat of possible attacks forced North Carolina to explore the idea of constructing a fort on its western frontier. Royal Governor Arthur Dobbs requested funds from the North Carolina

General Assembly to construct a fort to protect the colony's western settlements. The fortification was described as "a Barrack and Fort for the Company on the Western Frontier." In addition, the legislature also took steps to build additional forts to protect the colony's ports along the seacoast.

Captain Hugh Waddell formed a company of provincial rangers, and his unit was assigned to build the fortification near the foothills of the Blue Ridge Mountains in 1756. Waddell and his rangers selected a site along the fork of Fourth Creek, a tributary of the Yadkin River. Log palisades surrounded the fort, which contained a rectangle-shaped main building in the center.

The main building was described as 53 by 40 feet in size. This building or blockhouse had oak walls roughly between 6 to 16 inches in width. The blockhouse had three floors, where slots were available to run musket barrels through to defend the compound.

After its construction, Francis Brown and Richard Caswell inspected the fort and they described the post as "a good and Substantial Building." Captain Waddell and his rangers remained at Fort Dobbs, which was named after the colony's governor. The fort provided a base for rangers patrolling the area as well as a place of refuge for settlements during threats of Indian raids.

On the night of February 27, 1760, a raiding party of roughly 60 to 70 Cherokees attacked the post. Waddell and his rangers repelled the attack with only 1 killed and 2 wounded. The raiding party suffered perhaps 10 to 12 killed and wounded. By 1761, however, the threat to the western settlements subsided and the garrison was reduced to only 30 men. In 1764, the fort was abandoned by the colony, and its building and walls were dismantled. The site of the fort is now protected by the State of North Carolina.

Fort Dorchester (South Carolina)

English fort built between 1757 and 1760, during the French and Indian War (1754–1763), and located at the colonial town of Dorchester on the Ashley River about 25 miles northwest of Charles Town (present-day Charleston, South Carolina). Founded by a group of Massachusetts Congregationalists in 1695, Dorchester thrived as an important trading post until most of the residents migrated to a

new community near Midway, Georgia. The village still attracted merchants and farmers through the mid-1700s, but it failed to thrive as it had earlier.

During the winter of 1756–1757, concern about a French naval threat to Charles Town drew new interest in remote Dorchester. Gov. William H. Lyttelton worried that if the French attacked and captured Charles Town, then the only powder magazine in the colony would be lost. Thus Lyttelton proposed establishing a magazine in the interior of the colony. In January 1757, the South Carolina Assembly agreed to build one at Dorchester and provide a small guard to secure it against attack.

The powder magazine itself was to be constructed of brick, but the fort was made of tabby, a concrete-like mixture of oyster shells, lime, and sand. Thousands of bushels of oyster shells were brought up the Ashley River to the construction site on a bluff above the river. The tabby walls of the fort were 8 feet high and 2 feet thick, forming a rectangle of 100 square feet with half-bastions on the corners to allow the defenders to fire down the length of the walls. The powder magazine was built in the center of the fort and partially buried to minimize damage from an explosion.

Work on the fort continued until May 1760, when funds were diverted for other military construction in the colony. Though never used during the colonial wars, Fort Dorchester served as a critical base during the early years of the American Revolutionary War to secure government records and store ammunition, weapons, and other supplies. The resilient tabby structure still exists today and is one of the best preserved examples of a unique colonial construction method.

Fort Dummer (Vermont)

Massachusetts frontier fort built in 1724 in what is now southeastern Vermont, during Dummer's War (1722–1727). Fort Dummer served as a patrol base to detect and deter Native American and, later, French raiders bound for Massachusetts' Connecticut River Valley. It was also used as a trading post. With the outbreak of Dummer's War in 1722, Abenaki raiding parties descended on the northern New England frontier.

In December 1723, the Massachusetts Assembly authorized construction of a blockhouse capable of garrisoning 40 men on the Connecticut River's western shore, just north of the colony's border. Named after Lt. Gov. William Dummer, the fort's construction

began in February 1724. Lieutenant Timothy Dwight, supervised by Colonel John Stoddard, along with a dozen carpenters and militiamen constructed the roughly 100-square-foot stockade with walls of stacked squared pine timbers nearly 20 feet high. Three interior corners contained two-story houses that doubled as blockhouses. Storehouses and other housing lined the other walls. A 14-square-foot tower stood amid the parade ground, and the fort also contained several cannon and swivel guns.

From spring 1724 through the war's end in 1727, militia and friendly natives based at Fort Dummer ranged the frontier looking for signs of raiders. The raiders usually avoided the provincial patrols and only attacked the fort once. On October 11, 1724, 70 Abenaki warriors struck, but the fort's artillery drove them off. Rather than confront the fort again, war parties harassed the garrison or killed individuals beyond the fort's protection.

Although Fort Dummer was technically in New Hampshire, Massachusetts alone garrisoned and maintained the post. The New Hampshire Assembly refused to support a fort 50 miles away from its nearest settlement, even defying Crown orders in 1744. For more than 20 years, Massachusetts unsuccessfully used New Hampshire's intransigence to gain Fort Dummer's surrounding lands.

With peace after 1727, the fort converted to a "truck house," essentially a trading post for local natives. Its stockade expanded and numerous small dwellings sprang up in its shadow. The fort also served as a center for tribal negotiations.

With King George's War (1744–1748), the fort resumed its military mission, although the enemy was now France as well as the Abenakis. Raids often originated at France's Fort St. Frédéric near Lake Champlain's southern end. However, by then, Fort Dummer was no longer the first line of defense. Fort at Number Four, built by New Hampshire settlers 30 miles up the Connecticut River, bore the brunt of French and native attacks. Fort Dummer's patrols ranged widely, with one group even reaching the Champlain Valley. Although it was not attacked directly, French and Native American raiding parties harassed the fort, as well as surrounding settlers, until war's end in 1748.

During the French and Indian War (1754–1763) the Connecticut River became a military backwater, overshadowed by the Champlain Valley. Garrisons rarely exceeded a dozen men. After the collapse of New France in 1763, Massachusetts abandoned the fort and locals appropriated its timbers. In 1907, a new dam's backwater completely flooded the site.

Fort Dupui (Pennsylvania)

Pennsylvania post located south of the current town of Shawnee in Monroe County on the Delaware River, along Pennsylvania's northeastern frontier. The garrison was named for Samuel Dupui, a local French Huguenot. Dupui lived at Esopus, married a Dutch woman, and before 1725 moved to the Minisink area along the Delaware. He bought a part of the flat land where present-day Shawnee is situated, as well as property from lawyer and merchant William Allen. Dupui constructed a dwelling superseded by a stone residence in which he lived when Native American troubles began in 1755, during the French and Indian War (1754–1763). That same year, the region's settlers built a spacious stronghold excluding bastions but with one swivel cannon in each of its four nooks.

Fort Dupui became one of eight secondary provincial posts built in early Northampton County (now Carbon, Lehigh, Monroe, and Northampton counties). The provincial commissioners designed these installations as short-term positions amid settled communities until Fort Allen, Fort Franklin, Fort Hamilton, and Fort Norris could be erected.

Fort Dupui protected the lower section of the Minisink area. Native raids in December 1755, and the assault on neighboring Brodhead's Fort in particular, isolated the region's people. Although a weak post, Fort Dupui provided refuge for successive military units between December 1755 and May 1758. It also provisioned adjacent forts under the provincial commissary's direction and, with the signing of the Third Treaty of Easton in August 1757, remained open as a base for provincial rangers.

Fort Duquesne (Pennsylvania)

French-built fort erected in 1754 at the confluence of the Monongahela River and Allegheny River in western Pennsylvania, at the current site of Pittsburgh. The post was named for the governor-general of Canada, Ange de Menneville, Marquis de Duquesne. Fort Duquesne was a key French installation designed to secure French claims to the Ohio Country to the west and south. During its short existence (1754–1758), the fort became the focal point of three British military campaigns during the French and Indian War (1754–1763).

The French erected Fort Duquesne as the lynch pin in a line of fortifications designed to reimpose French control over Native Americans in the Ohio Country and to impede the movement west of British colonials. Its location astride the headwater of the Ohio River assigned great importance to the small garrison, which the British and their American colonists repeatedly tried to capture. The largest of the area's four forts, the post was square in shape and made of wood. It had a 10–12 foot ditch surrounding it and bastions in each of the four corners. Fort Duquesne was equipped with approximately 15 guns; 6 were 6-pounders, and the rest were 2- or 3-pounders. Sometime after 1754, several buildings were built just outside the fort's northeast wall and outfitted with protective earthen and wood walls. The post was designed to house 200–300 men, but that number frequently swelled to as many as 1,500 as soldiers from Canada made their way south.

Virginia launched the first campaign against Fort Duquesne in early summer 1754. Lacking adequate manpower and discipline, however, the campaign floundered after a detachment of 600 French and allied natives defeated the Virginians at Fort Necessity on July 3-4, 1754. As tensions between Great Britain and France escalated toward open war, the British made the capture of Fort Duquesne a principal goal of their military strategy in 1755. Thus Major General Edward Braddock arrived in Virginia early in 1755 to lead a campaign to capture Fort Duquesne. Braddock's 2,200 British regulars and colonial militiamen crossed 120 miles of wilderness terrain in June 1755, eventually advancing to within 10 miles of Fort Duquesne. However, some 250 French and 600 native allies ambushed Braddock's army shortly after it crossed the Monongahela River. In the resulting battle, the British lost two-thirds of their force, including Braddock, and quickly retreated back into Virginia. Consequently, Fort Duquesne remained secure for the next three years, serving as a staging point for raids along the colonial frontier.

Following a reorganization of the British government, the capture of Fort Duquesne again ranked high on the list of British military goals for 1758. Brigadier General John Forbes, in command of 1,600 British regulars and several thousand colonials, cautiously advanced across southern Pennsylvania throughout the summer of 1758. Along the way, Forbes secured the neutrality of previously French-allied Native Americans, depriving the French garrison at Fort Duquesne of sorely needed scouts and shock troops. Badly outnumbered and overmatched, the French destroyed the fort in

Major George Washington and his men raising the British flag at Fort Duquesne in 1758. (Bryan, George S., *The Mentor, Pioneers of the Great Wests*, vol. 8, no. 1. New York: The Mentor Association, February 20, 1920)

November and withdrew down the Ohio River. The British immediately occupied the site and commenced construction on a larger earth and log structure, which they named Fort Pitt. They would maintain a tenuous hold over the region for the next 15 years.

Fort Ebenezer (Georgia)

English-built redoubt erected in 1757 approximately 25 miles northwest of Savannah (modern Effingham County, Georgia). In 1757, Georgia's Lt. Gov. Henry Ellis recognized the need for a fortification at the Salzburger settlement of Ebenezer. The Salzburgers were German Lutherans who had settled the area beginning in 1734. Ellis had arrived in Georgia in 1757 to act as temporary governor during the French and Indian War (1754–1763). He quickly determined that the Georgia colony had to improve its defensive infrastructure to defend against the French, Spanish, and natives. By 1765, Ebenezer and its surrounding satellite settlements were a thriving community of about 3,000 people.

In August and September 1757, Ellis ordered the men of the colony to build a string of fortifications at key sites along the frontier. The people of Ebenezer were fortunate to have as one of their residents an expert military engineer and the royal surveyor general for the southern colonies, William Gerard De Brahm. De Brahm had previously designed fortifications at Savannah, Charles Town

(present-day Charleston), and Fort Loudoun (Tennessee). He now undertook to build a fort to protect the Salzburgers.

Assisted by royal funding, De Brahm directed the town's residents to build a large earthen fort in the northeast section of town. It was rectangular in shape with four projecting corner bastions. The fort surrounded a group of 10 town lots, the owners of which were compensated for the military use of their property. De Brahm owned one of the lots and may have chosen the location based on personal interest.

No action occurred at Ebenezer during the course of the French and Indian War, and after 1763 the fort was abandoned and dismantled. In 1775, the remains of De Brahm's fort were used as a storage site for rebel arms and powder. Ebenezer served throughout the American Revolutionary War as a key logistics base and major headquarters for both British and American armies.

Fort Edisto (South Carolina)

English post erected in May 1715 and located at Givhans Ferry along the Edisto River in eastern South Carolina. The post was situated on the grounds of a plantation belonging to James Rawlings, now the site of Givhans Ferry State Park in Dorchester County, South Carolina. The South Carolinians put up the redoubt to meet the immediate needs of the Yamasee War (1715–1717).

The war was sparked mainly by unscrupulous trade practices of certain colonial deerskin traders. Although many of the area's tribes had begun to complain about trade arrangements, the Yamasees, whose home base was just 100 miles from Charles Town (present-day Charleston, South Carolina), had the most grievances. They were also deeply indebted to white traders, debts that in fact would have taken a generation or more to repay. The war began in April 1715 with a combined attack against white settlements by the Yamasees, the Creeks, the Savannahs, and the Apalachees. Within weeks, colonists had hastily built Fort Edisto in order to protect Charles Town and other coastal settlements from attacks from the west. Local militia constituted the fort's garrison, which was reinforced by several river boats.

The Yamasee War was one of the most vicious conflicts between natives and Europeans ever fought in colonial North America. The war dragged on into late 1716. The English, with the help of their native allies, emerged victorious—if tattered. A final peace settlement was not concluded until November 1717. The agreement had been reached with the Creeks, who ended up being the principal instigators of and fighters in the Yamasee War. In late December 1716, the garrison at Fort Edisto was withdrawn and the fort abandoned.

Fort Edward (New York)

Fort Edward refers to three fortifications constructed between 1709 and 1766 on the same site, located astride the upper navigable reaches of the Hudson River. This strategic site, called variously the "Long Portage" or "Great Carrying Place" (not to be confused with the "Great Carrying Place" on the Mohawk River where Fort Stanwix stood) was a critical point in the British military transportation system because it provided the best access point to the southern edge of Lake George, only 14 miles distant. The first post, a mere stockade, was built by order of Colonel Francis Nicholson to serve his army, whose 1709 attempt to invade Canada proved stillborn. In 1731, another defensive structure was built to protect the commercial center and settlement founded by John Henry Lydius, an Albany fur trader. French and Native American raiders destroyed Fort Lydius a decade later during King George's War (1744–1748).

The third installation, begun in 1755 by Major General Phineas Lyman of Connecticut, was named "Edward" by Sir William Johnson to honor Edward Augustus, then the duke of York and younger brother to the future king George III. At a cost of more than £14,000, two regular engineers, James Montresor and Henry Gordon, supervised renovations of this provincial post during the summers of 1756 and 1757. They eventually constructed a large military complex based around a four-bastioned defensive work, capable of holding more than 1,000 regular and colonial troops in two barracks blocks. Fabricated primarily of earth and timber on the eastern bank of the river, the fortress was designed to shield Albany from French and native raids. Another set of buildings was built on an adjacent island, which served as headquarters for Robert Rogers's rangers. It was connected to the fort by a bridge. On the western bank of the river, a fortified blockhouse stood to protect the facilities.

Fort Edward was never seriously threatened by enemy action at this time. Its strength, large garrison capacity, and proximity to reinforcements made it too dangerous a post for the French to assail following their capture of neighboring Fort William Henry in 1757. Instead, it acted as a springboard for British thrusts northward. Each May, large Anglo-colonial forces would congregate at Fort Edward

for training and then take to the field for summer operations. Both Major General James Abercromby and Major General Jeffery Amherst launched their respective campaigns during the French and Indian War (1754–1763) from Fort Edward's environs. It remained an important logistical center, however, even after the fall of France's Fort Ticonderoga and Crown Point in 1759, when the seat of combat operations moved much farther up Lake Champlain.

The fortress fell into disrepair following the conquest of Canada but was not finally abandoned by the British Army until 1766. By then, most of its works had fallen into a state of decay because of the earth and wooden construction. The site, however, had become a desirable area for settlement because earlier military forces had cleared great swaths of land in the immediate area during their years of occupation.

Fort Elfsborg (New Jersey)

Swedish-built fort erected in 1643 on the New Jersey side of the Delaware River between present-day Salem, New Jersey, and Alloway Creek. Constructed on the orders of Johan Printz, New Sweden's governor, Fort Elfsborg sat on land previously held by the Delaware tribe. The Swedes had purchased it in 1641, recognizing the strategic value inherent in its elevation, which commanded a view of the Delaware River. An earthen-work fortification, Fort Elfsborg had three angles fronting the river, each with a bastion. The bastions featured four bronze 12-pounder guns, four iron 12-pounder guns, and one mortar.

In 1638, the Swedes established New Sweden along the southern portion of the Delaware River. The Dutch, who had already established a colony to the north, now sought to crowd out the Swedes, whom they viewed as interlopers bent on stealing their lucrative fur trade. The Dutch also laid claim to the land now being settled by New Sweden. As a counterpoint to New Sweden, New Netherland built Fort Nassau (New Jersey) on the Delaware River, located just south of modern-day Philadelphia. This is not to be confused with Fort Nassau, New York. In response, Printz built Fort

Elfsborg farther downriver. In so doing, Printz knew that New Sweden would now be in a position to monitor all water traffic moving north from the Delaware Bay or moving south toward the Bay. The impact on trade was obvious, as the Swedes were now in a far better position to influence fur trading. After 1643, all ships moving past Fort Elfsborg were required to drop anchor and be searched by the Swedes. This infuriated the Dutch, who redoubled their efforts to evict the Swedes from the region.

In 1651, New Sweden abandoned Fort Elfsborg. As it turned out, the location of the fort could not have been worse. Surrounded by a quagmire of swampland, the fort's garrison was subjected to swarms of mosquitoes. Those inhabiting the post were so hounded by the insects that one colonist remarked that "the people were so swollen, that they appeared as if they had been affected with some horrible disease." Soon after construction, the fort had been nicknamed "Fort Myggenborgh" or "Fort Mosquito." Dutch moves along the Delaware were another motivating factor behind the closure of the post. In July 1651, New Netherland opened Fort Casimer, farther to the south of Fort Elfsborg, rendering the Swedish post all but obsolete.

Fort Frederica (Georgia)

British fortification built in 1736 on St. Simons Island, south of Savannah, Georgia, and east of Brunswick. The fort was constructed on the orders of Georgia founder James Oglethorpe. Fort Frederica was one in a series of fortifications that Oglethorpe built in eastern and coastal Georgia to keep Spanish troops in Florida from seizing contested Georgia territory. Oglethorpe expected a Spanish attack to claim land they desired. He also sought to prevent Spain from securing access to sea islands that would enable them to mount invasions against the mainland. Oglethorpe also saw the new fort as a staging area from which to launch attacks on Spanish-held St. Augustine.

Surveying the coast south from Savannah, Oglethorpe selected St. Simons Island as his military headquarters. He picked a location on the Altamaha River, adjacent to a marsh and lush forests beyond it, and ordered construction of Fort Frederica to guard his colony. Soldiers and skilled laborers built the fort in 1736 on a river loop so they could monitor traffic and react quickly if enemy ships approached.

The fort contained basic military structures, including storehouses and a powder magazine. The garrison was square-shaped, with bastions in each corner, and measured approximately 125 by 124 feet. In addition, it boasted a spur battery that protruded out and toward the river. An adjacent community of craftsmen and settlers, including indentured servants, provided services to the fort, which was manned by the 42nd Regiment of Foot.

On July 5, 1742, Spanish commander Manuel de Montiano's troops arrived on St. Simons Island. After taking Fort St. Simons, they marched toward Fort Frederica. Concealed English forces, supported by Native American allies, surprised the Spanish on the military road at Gully Hole Creek and proceeded to defeat them at Bloody Marsh. The Spaniards tried twice to attack the fort from the river and raid it at night, but were unsuccessful.

Oglethorpe continued pursuing the Spanish with Fort Frederica as his principal base until he returned to England in 1743. After a 1748 peace treaty with Spain, the fort was abandoned, and many residents in and near Frederica moved. A 1758 fire razed most of the deteriorating fort and surrounding town structures. Fort Frederica was designated a national monument in 1945. Today, the U.S. National Park Service oversees the fort's ruins and archaeological excavations.

Fort Frederick (Maine)

See Fort William Henry (Maine)

Fort Frederick (Maryland)

British stronghold built in 1756–1758 in the Cumberland Valley, 18 miles west of modern-day Hagerstown, Maryland, near the Potomac River. Fort Frederick was the center of Maryland's frontier defense during the French and Indian War (1754–1763). Named in honor of Maryland's lord proprietor, Frederick Calvert, Sixth Lord Baltimore, construction on the fort began in 1756 on the orders of Gov. Horatio Sharpe.

Fort Frederick was unique because of its large size and stone walls. Most other frontier forts were built of earth and wood. Indeed, the post was one of the largest fortifications built by colonists in North America. Its exterior lines ran 355 feet from bastion point to bastion point, and it stood 18 feet high. The walls were 3 feet thick. At least three major buildings originally stood within the walls, including the barracks that could comfortably accommodate 200 men, and in times of emergency could house twice that number.

236 Fort Frederick (South Carolina)

The design of Fort Frederick conforms to the style developed in the early 18th century by Sébastien Le Prestre, Marquis de Vauban, the French military engineer who is considered the father of modern fortification. Sharpe personally directed much of the construction. Although funds to construct the fort were cut in 1758, by that time much of the work had been completed.

Fort Frederick served as a supply base for several French and Indian War campaigns and a number of different types of troops were assigned there. These included various county militias, provincial troops from Virginia and North Carolina, volunteer Ranger companies, royal regulars (most notably, the 60th Regiment of Foot), and Maryland forces.

In 1756, Fort Frederick was designated by the Maryland Assembly as the westernmost position the colony would defend. After that, all troops stationed at Fort Cumberland (Maryland) were withdrawn to Fort Frederick. The fort saw no military action, however, and was abandoned after the English capture of Fort Duquesne in 1758. English colonials temporarily reoccupied the post in 1763, when several hundred settlers and militia sought protection within its walls during Pontiac's Rebellion. It was again used during the American Revolutionary War to serve as a prison for Hessian and British soldiers.

Maryland sold Fort Frederick in 1791, and its surrounding acreage was used as farmland. During the American Civil War, Union troops served there to help defend railroad lines from Confederate attacks.

Fort Frederick (South Carolina)

British fort built between 1731 and 1734 and located roughly three miles south of Beaufort, South Carolina. The fort stood along the Beaufort River in what is now the town of Port Royal. A U.S. Navy hospital currently stands close to the ruins of Fort Frederick.

Fort Frederick went up in an effort to protect Beaufort against native raids and threats from the Spanish at St. Augustine.

Map of the British and French settlements in North America, including an inset of Fort Frederick in South Carolina, ca. 1755. (Library of Congress)

The post featured four-foot-high outer walls made of tabby. Tabby is a mixture of lime, water, and oyster shells that renders surprisingly strong and durable structures. To make the tabby, workers harvested the rich oyster beds that abounded in the adjacent waters.

The fort was approximately 125 feet long and 75 feet deep. A bastion was located on the southwest side of the structure. A number of cannon were mounted along the eastern side of the fort, which looked onto the Port Royal River. Inside the walls were a powder magazine and barracks.

Between the 1730s and 1750s, both colonial and British regular troops served as Fort Frederick's garrison. From 1731 to 1736, the post was home to an independent company of British regulars. The fort was also periodically reinforced with scout boats.

By the end of the 1750s, however, the fort had fallen into disrepair. In 1757, the South Carolina Assembly directed that a new fort be built. A year later, construction began on Fort Lyttelton, which replaced Fort Frederick. The site where Fort Frederick once stood is now part of a three-acre tract known as the Fort Frederick Heritage Preserve. There the ruins of the post remain, believed to be the oldest tabby structure in South Carolina.

Fort Frey (New York)

British outpost built in the 1690s on the north side of the Mohawk River opposite Canajoharie, New York, 40 miles west of Schenectady. Heinrich Frey, an immigrant from Zurich, Switzerland, originally settled the site in 1689. Frey was the first European settler in the area, the land of which then belonged to Native Americans. Frey purchased 300 acres from the Mohawks and built a log cabin. At the beginning of Queen Anne's War (1702–1713), the British took over the cabin, built a palisade around it, and retained it as a post even after the conflict ended.

In 1739, Frey's son Heindrick built a new house to replace the cabin. This one and a half story structure is still standing at its original location in Palatine Bridge. The house was also used by the British as part of a military and trading post. Although the British never palisaded the new house, Fort Frey—as it was now known—served as a strategic redoubt for the British during the French and Indian War (1754–1763) to protect the Mohawk River route.

During the American Revolutionary War, two of Heindrick Frey's sons, Henry and Bernard, supported the Crown, and the third, John, joined the Tryon County Militia. Henry was eventually imprisoned, whereas Bernard served with Butler's Rangers. John rose to the rank of major and fought at the Battle of Oriskany. He later participated in the convention that helped ratify the Constitution in New York. Fort Frey itself remained in the possession of the Frey family until at least the latter half of the 19th century.

Fort Frontenac (Ontario)

French garrison founded on July 12, 1673, named for Quebec's celebrated 17th-century governor, Louis de Baude de Frontenac. Fort Frontenac was located on the northeastern shore of Lake Ontario and abutted the Cataraqui River near present-day Kingston, Ontario. It initially consisted of several small buildings surrounded by a wooden palisade. Construction at the time was feasible only because the English were engaged overseas and the Iroquois—perennial enemies of the French—were tied up fighting the Susquehannocks and the Mohegans. The fort began to evolve into a true stronghold in 1675, after the French Crown appointed explorer René-Robert Cavelier, Sieur de La Salle, its commanding officer.

By 1677, La Salle had converted the fort into an imposing, square-shaped structure, with stone walls 3 feet thick, 15 feet high, and 300 feet long, complemented by 30 cannon and bastions at each corner. First of the major European colonial outposts on the lower Great Lakes, Fort Frontenac also allowed for the construction and harborage of an armed fleet, giving the French early naval supremacy on these strategically vital inland waters.

During the latter stages of the Beaver Wars (1641–1701) against the Iroquois and during the overlapping conflict with the British known as King William's War (1689–1697), Fort Frontenac proved to be both an asset and a liability to the French. On the one hand, it was an extremely valuable support base for military expeditions deep into Iroquois territory. It had, after all, been King Louis XIV's 1665 edict demanding the "extermination" of the Iroquois that inspired the construction of the fort in the first place. The resulting scorched-earth campaigns against Confederacy nations such as the Senecas in 1687 and the Onondagas and Oneidas in 1697 were all launched from Fort Frontenac, and were a primary reason France was able to secure an advantageous peace with the Iroquois in 1701. Furthermore, the fort commanded the main route leading from the Iroquois homeland south of Lake Ontario to the Ottawa tribal territory in the north, impeding a potential alliance between these two

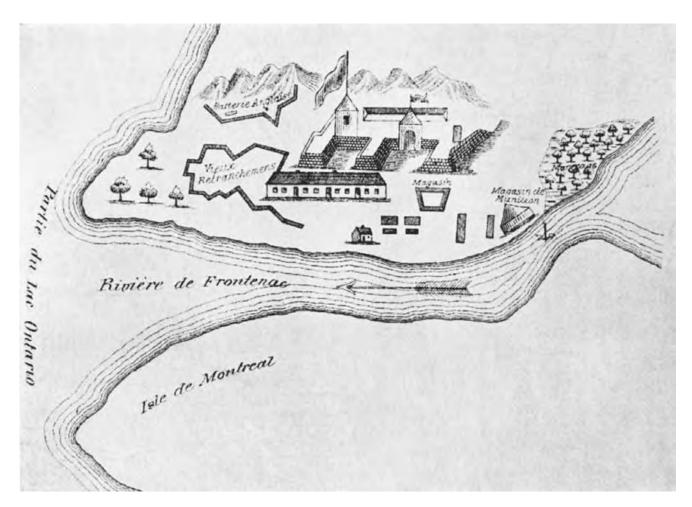

groups, the forging of which would have diverted thousands of Canadian furs from Montreal to Albany.

Yet during this same period, Fort Frontenac's disadvantages were also glaringly apparent. It was so susceptible to assault by land that the Iroquois were able to keep it under continual siege from 1687 to 1688, causing scurvy and other maladies to spread among the fort's occupants. The supply line from Montreal to the Cataraqui was also extremely vulnerable and unreliable, entailing as it did numerous portages from where ambushes could easily be sprung. By 1689, the drain of this on military personnel and material, coupled with the brutal Iroquois attack on Lachine on July 25–26, 1689, forced the French to raze Fort Frontenac and withdraw the garrison.

Rebuilt and reoccupied by 1697, Fort Frontenac soon became far more important as a trading center and symbol of French sovereignty than as a military outpost. Although Louis XIV had formerly discouraged fort building and western expansion for fear of spreading his colony too thin, the imperial rivalry with Britain that began in earnest with the onset of Queen Anne's War (1702–1713) forced a reversal of this policy. Thus instead of being seen as a drain on the population of New France, Fort Frontenac and similar outposts were now treated as de facto villages. During this era,

Louis XIV went from punishing *coureurs de bois* as traitors to considering them as manifest extensions of French power in North America. It is no coincidence that these Canadian fur traders increasingly began carrying government *licences* and were granted the more respectable title of *voyageur*. French territorial expansion combined with the fur trade made outposts such as Fort Frontenac economically self-sustaining and even profitable. And in their role as the king's posts, they cemented native alliances while checking British commercial and territorial ambitions.

The next major action involving Fort Frontenac came during the French and Indian War (1754–1763), in which it figured prominently in the strategies of both the French and English. Fort Frontenac and its nemesis directly across the lake, Fort Oswego (begun by the British in 1724), would be key staging areas during the war, and would wind up facilitating each other's destruction. In 1756, French major general Louis-Joseph, Marquis de Montcalm, attacked from Fort Frontenac with 3,000 men and completely pillaged all of Oswego's fortifications. Two years later, on August 25, 1758, Lieutenant Colonel John Bradstreet mustered a force on the ashes of Britain's erstwhile stronghold and repaid the French by leading a successful amphibious assault against Fort Frontenac. By August 28, Bradstreet had

Etching showing Fort Frontenac on Lake Ontario, near present-day Kingston, Ontario. The fort was established in 1673. (North Wind Picture Archives)

forced the capitulation of the commandant, Pierre-Jacques Payen de Noyan, and burned the ships anchored in the fort's harbor, thus extinguishing the French naval presence on the Great Lakes.

Even more significantly, perhaps, the subsequent razing of Fort Frontenac destroyed a huge stockpile of supplies destined for Fort Duquesne, paving the way for British follow-up attacks that put French Canada on the defensive for the duration of the war. After Bradstreet's incursion, Fort Frontenac would remain in ruins for the remainder of the colonial period, and would not see occupation again until the 1780s, when Loyalists fleeing the American Revolutionary War settled among its remains and built on it the future capital of a united Canada.

Fort Garrison (Maryland)

English post constructed in late 1692 in Baltimore County, Maryland, adjacent to the falls of the Patapsco River. Fort Garrison was one of three forts erected that year in Maryland to protect settlers from Native American raiding parties. Perhaps the biggest impetus for the building of the forts was King William's War (1689–1697), which set the English North American colonies against New France and its native allies.

Fort Garrison was an imposing outpost built of stone on a rise that afforded a commanding view of the surrounding area. Its main feature was a fieldstone blockhouse that measured 48 by 18 feet. The blockhouse walls were nearly 2 feet thick. Cut into the stout

stone walls were six holes through which muskets could be fired. The roof was also of stone to stymie any attempt to set the structure ablaze. Sometime after the original construction, Fort Garrison's blockhouse was expanded to include a short second story, and the roof was altered with a different pitch and no longer made of stone. Several small outbuildings lay within a short walk of the blockhouse, at least one of which housed a contingent of Native Americans who provided assistance to the fort's 10-man garrison.

Because of settlers' fears of attack, heightened by the ongoing war and episodic native raids, Maryland's governing council appropriated funds for increased defenses along the frontier in the spring of 1692. Ultimately, three forts were erected, the construction for which was covered by a general tax on all settlers. In addition to Fort Garrison in Baltimore County, Marylanders built forts in Anne Arundel County and Charles County. The council also provided funds for the manning of each. Their garrisons were 10 mounted rangers, including 1 captain or commander. Rather that stay in or near the forts, the rangers patrolled a wide area surrounding them in an attempt to deter native—and possibly—French attacks.

By 1696, Captain John Oulton, Fort Garrison's commander, wrote that his men had cleared roads and were regularly patrolling an area some 50 miles distant from their home base. The flourishing tobacco trade also made Fort Garrison an important outpost, as it lay near a series of roads and river landings used to bring the cash crop to market near the coast. The redoubt also protected a major route that took white settlers along native trails as they headed westward.

In 1755, during the French and Indian War (1754–1763), Fort Garrison served as a safe haven when Maryland's frontier settlers panicked after the defeat of British forces under Major General Edward Braddock near Fort Duquesne. Fort Garrison's commanding officer, Captain John Risteau, called for all nearby settlers to arm themselves. He also augmented the ranger garrison by housing a contingent of local militiamen within the fort.

Fort Garrison probably never came under direct attack. In the years to come, and as the threat of attack decreased, Fort Garrison became less important. The expansion of the frontier ever westward also made the post's functions superfluous. Eventually, Fort Garrison would be abandoned, although it survives to the present day in Maryland as the oldest stone fort in the state.

Fort Gaspereau (Nova Scotia)

French fort constructed in 1751, situated on the north side of the Chignecto Isthmus, which connects Nova Scotia to the Canadian mainland. The French built the fort primarily to protect the Acadian community of Baie Vert and the overland route to Quebec from the Bay of Fundy. The French began the construction of Gaspereau after the English completed Fort Lawrence, which had been built to counteract Fort Beauséjour. Fort Gaspereau was erected just 15 miles from Beauséjour. Although the French regarded Fort Lawrence as unimportant, Abbé Jean Louis Le Loutre, missionary to the Micmacs and Acadians, believed otherwise. Indeed, it was largely through his efforts that Fort Gaspereau was built.

Constructed at the mouth of the Gaspereau River, two miles from Baie Vert, Fort Gaspereau consisted of a palisaded earthwork that was 180 feet square and flanked by two-story blockhouses that had small cannon in the upper levels. The palisades were surrounded by a ditch, although it appears that at the time of its surrender the ditch had not been completed. Additionally, the fort lacked ramparts. The interior contained a barracks, commander's quarters, storehouse, and powder magazine. The fort contained no water supply within its walls. Although the barracks were designed to hold up to 200 soldiers, few French troops were stationed there. After the outbreak of the French and Indian War (1754–1763), the French further strengthened Fort Gaspereau in 1754 with the addition of a plank roadway across Baie Vert directly connecting it to Fort Beauséiour.

In spring 1755, Gov. William Shirley of Massachusetts raised 2,000 men under the command of Colonel Robert Monckton to capture Fort Gaspereau and Fort Beauséjour. The expedition left Boston on May 23, 1755. On June 16, Beauséjour surrendered, leaving Fort Gaspereau to face the English colonial troops alone. A detachment under Colonel John Winslow marched to Fort Gaspereau on June 18 and demanded the fort's surrender. With only 30 men and a few officers facing 500 opposing troops, Fort Gaspereau surrendered. Rather than have to house the prisoners, in early July the English sent the captured French troops to Fort Louisbourg, and the French governor there subsequently sent the men on to Quebec in mid-August 1755.

Winslow's inventory of materials captured at Fort Gaspereau included four 4-pounder and four 2-pounder cannon, two swivel guns, seven barrels of powder, 1,300 round shot, a hundredweight of musket balls, and 50 cartridges. Winslow described the buildings as uninhabitable and the storehouse as leaking. He also noted that the garrison was short of flour and lacked sufficient water. Despite a recommendation that it be demolished, the British effected repairs and garrisoned the fort with 200 men for the winter of 1755–1756. The British renamed it Fort Monckton. After losing a dozen men in the vicinity and seeking to strengthen Fort Cumberland, in September 1756 the British decided to withdraw their 200-man garrison and destroy the fort.

Today the fort's ruins are a Canadian National Historic site, with a stone cairn, reconstructed ditch, and military cemetery holding the remains of French and English troops.

Fort George at the Battery (New York)

See Fort James (New York)

Fort George (Rhode Island)

See Fort Anne (New York)

Fort George (Virginia)

Fort named for England's King George II (1683–1760), constructed in 1736. Fort George was the third fort built by the Virginians to defend the mouth of the James River at Old Point Comfort. As was typical of colonial Virginia's forts, its construction was prompted by an increase in the threat of attack by European powers, namely France and Spain. The land at Old Point Comfort was owned by Sir William Beverly; however, the colony began building Fort George prior to obtaining Beverly's approval. It finally agreed to pay £105 for the land parcel.

The remains of Fort George were described by Dr. Robert Archer in a letter he wrote to the Virginia Historical Society in 1847. In it, he portrayed the fort as a masonry structure with an inner wall some 18 inches thick and an outer wall 27 inches thick. The walls were braced by wooden beams that created cribs, which were filled with sand. In 1749, a massive hurricane undermined a corner of one of the fort's exterior walls, which promptly collapsed. The sand used to fortify the cribs was undermined, putting stress on the wooden beams. Once one bay collapsed, the others came down in rapid succession. Fort George was not rebuilt after the 1749 storm. In 1781, the British considered rebuilding the fort at the same location but never followed through with their plans. In 1817, however, the U.S. Army began the construction of Fort Monroe on the site of Fort George.

Fort Gloucester (Massachusetts)

A series of fortifications on a bluff called Stage Head overlooking Gloucester Harbor on Cape Ann in northeastern Massachusetts. Never officially named, these defenses were known by many informal designations. The name of the bluff was derived from the fishing stages (drying areas) constructed there by the Dorchester Company in 1623.

Simple breastworks were constructed there in 1703, during Queen Anne's War (1702–1713). In preparation for King George's War (1744–1748), breastworks with a platform capable of carrying eight 12-pounder cannon were constructed there in 1743. At the same time, Fort Libby was built in another part of Gloucester. The harbor's defenses were renovated once again for the French and Indian War (1754–1763) and in 1775 for the American Revolutionary War.

As a relatively secure site after the 1690s, the town of Gloucester gained indirect benefits from the colonial wars. Its population grew as it attracted refugees from the Maine frontier as well as some of the demobilized soldiers who had earlier passed through on their way to Quebec or Port Royal. The wars gave added impetus to the timber and shipbuilding trades, and reduced competition from Maine, which transformed the town's economy. The expulsion of the French from Nova Scotia reduced the risk of attack on fishermen and thus spurred the expansion of long-range fishing fleets. On the other hand, the town suffered from the mobilization (and subsequent loss) of many men and from the constant disruptions of fishing and shipping.

Fort Good Hope (Connecticut)

Dutch fortified trading outpost, sometimes also referred to as House of Good Hope, constructed in 1633 along the west bank of the Connecticut River. In June 1633, Governor-General Wouter van Twiller of New Netherland sent agents to secure Dutch interests in the Connecticut River Valley, site of a thriving fur trade. Jacob van Curler and a company of soldiers sailed up the river, selected a site on the west bank (at present-day Hartford), and concluded a land purchase and trade agreement with the Pequots. The Dutch proceeded to build a trading post and named it House of Good Hope. Fort Good Hope consisted of a house protected by a palisade and armed with two cannon. The traders maintained livestock, planted a garden and an orchard nearby, and carried on a profitable fur trade.

Angered by the Dutch moves along the river, Gov. John Winthrop of Massachusetts wrote to van Twiller plainly stating the English claim to the Connecticut River Valley and warning him not to build a fort. Van Twiller replied that Good Hope was merely a trading post, not a military fort. He also said that Dutch claims, based on a 1624 expedition by Cornelis May, predated those of the English.

In short order, Plymouth Colony mounted an expedition up the Connecticut River by ship. The commander of Fort Good Hope ordered the English to halt, but they defied his orders and sailed on. The English then went ashore a few miles upriver, erecting a trading post there, and beginning a brisk fur trade as well.

Van Twiller ordered Jacob van Curler to return to the valley with a force of about 70 men to challenge the new English post. The English commander, William Holmes, stood firm, and English traders remained at their post, intercepting much of the valley's fur trade before it could reach Fort Good Hope.

Within a year, however, Dutch-Pequot relations disintegrated into a cycle of murder, revenge, and mistaken identity. The Pequots killed traders from a rival tribe as they approached the Dutch outpost and Dutch traders retaliated by killing a Pequot sachem (chief). The sachem's kinsmen took revenge by destroying a European trading vessel, which turned out to be English and helped precipitate the Pequot War. This violence nonetheless further curtailed trade at Fort Good Hope.

In September 1650, New Netherland's Gov. Petrus Stuyvesant traveled to Hartford to confer with New England officials and establish a border between the Dutch and English colonies. The resulting agreement gave Connecticut to the English. Shortly thereafter, word arrived of the outbreak of the First Anglo-Dutch War (1652–1654) in Europe. The Dutch maintained their post at Fort Good Hope until July 1653, at which time a New England force ejected them.

Fort Granville (North Carolina)

British post erected in 1749 on Beacon Island, not far from present-day Portsmouth, North Carolina, overlooking the Atlantic Ocean near Ocracoke Inlet. In 1748, the North Carolina Assembly appropriated funds to build a fort on the northeastern coast. Construction of Fort Granville began the following year.

The post was to serve mainly as a lookout and an initial defensive bulwark against a possible Spanish attack. The small structure was quite modest and not particularly well fortified. In 1757, the post was enlarged in large part because of the ongoing French and Indian War (1754–1763). The expanded Fort Granville was made of wood and shaped like an "L."

The fort was abandoned in 1764, although it was rebuilt and garrisoned during the American Revolutionary War. In 1794–1795, new buildings, including a blockhouse, were constructed at the site. The post was used during the War of 1812, but it again fell into disrepair. During the American Civil War, the Confederates built a

small sod fort on the ruins of what is thought to be Fort Granville. Union forces seized it in late 1861.

Fort Granville (Pennsylvania)

Pennsylvania garrison erected in December 1755, located a mile southwest of the current town of Lewistown in Mifflin County, along the Juniata River. George Croghan, a well-known trader and frontier diplomat, was instrumental in the construction of Fort Granville, which was named for John Carteret, Earl of Granville. A square structure with sides 83 paces in length, it possessed four bastions and interior accommodations for troops. An ungraded gorge without a glacis concealed the approach to the post, however, making it vulnerable to attack.

Fort Granville was one in a series of links in Pennsylvania's defensive perimeter of stockades located in the lower Juniata Valley and Aughwick Creek Valley of Cumberland County (now the counties of Cumberland, Franklin, Fulton, Huntingdon, and Juniata). Fort Lyttelton, Fort Shirley, Fort Granville, and Fort Patterson were constructed not far apart and were sometimes called the "LSGP line," based on the initials of each of the posts. Located west and northwest of Kittatinny Mountain and the half circle shaped by the Shade, Tuscarora, Blacklog, and Cove mountains and adjoining mountain ranges, the LSGP line ran parallel to old Native American north-south trails. Hence, patrols operating between the four posts were able to check native war parties.

In 1756, during the French and Indian War (1754–1763), Delaware and Shawnee warriors under Chief Shingas and Delaware chief "Captain Jacobs" raided Sherman's Creek Valley and the lower Juniata River Valley. Their attacks continued along Conococheague Creek. On July 22, Captain Jacobs invited Fort Granville's garrison to fight. Aided by a Frenchman, he lay siege and devastated the post, gaining advantage by approaching the fort's wall through the deep gorge that surrounded it. Native fire arrows, shot from the cover of the gorge, quickly burned breaches in the fort's wall. Sensing their great vulnerability and hoping for clemency, Fort Granville's occupants elected to allow the enemy free entry, bringing about its fall. Fort Granville's capture was the most important Native American triumph in Pennsylvania between the disastrous setback in 1755 of Britain's Major General Edward Braddock and Pontiac's Rebellion in 1763.

Pennsylvania's military defense was transformed after Fort Granville's capture. The LSGP line was evacuated and its garrisons were restationed in Cumberland County's eastern installations. In early September 1756, Colonel John Armstrong, whose brother had died at Fort Granville, led a band out of Fort Shirley across a passage to attack Captain Jacobs's camp in the hamlet of Kittanning (now Kittanning, Indiana County). Despite heavy losses, the expeditionary force killed Captain Jacobs and razed his village on September 8.

Fort Half-Moon (New York)

English-held redoubt located outside Albany, New York, on an island in the Mohawk River, near modern-day Waterford, New York. Fort Half-Moon, also known as Camp Van Schaick, had several iterations beginning in 1669.

The first outpost was probably built for the Schagticoke tribe. The English used the site only sporadically. In 1691, a garrison of fusiliers from nearby Albany briefly manned the post, which had been refurbished since 1669. The fort had deteriorated badly by the late 1690s, and English army engineer Colonel Wolfgang Romer set forth an ambitious plan to repair and augment the fortifications. The work probably began in 1698 and was completed by 1703. The rebuilt stronghold could then accommodate a permanent garrison of about 25 men and featured a stone and masonry palisade.

Between 1735 and 1755, Anthony van Schaick, a wealthy landowner with land rights to the area, including Fort Half-Moon and the island on which it sat, constructed a substantial house on the site. There is evidence that the van Schaick family had a smaller, wooden structure on the island prior to the building of the mansion. The new house was made entirely of brick and was considered quite elaborate for its time and place. During the French and Indian War (1754–1763), the Van Schaick mansion was used as a temporary headquarters by Major General James Abercromby and Major General Jeffery Amherst as well as Sir William Johnson. During the war, in 1757, Fort Half-Moon (by now also known as Camp Van Schaick) underwent a complete renovation and was reportedly built atop three-foot stilts to protect it from river flooding. Nevertheless, a 1759 British Army report termed the facility to be "poor."

Fort Half-Moon saw yet another incarnation during the American Revolutionary War. In 1777, Major General Philip Schuyler of the Continental Army ordered fortifications on the island to be rebuilt and substantially strengthened. Added to the post were a blockhouse, barracks, stockade, and entrenchments. Between 1777 and 1783, Major General Schuyler and Major General Horatio Gates both used Fort Half-Moon and the Van Schaick house as their headquarters.

Fort Halifax (Maine)

English fort erected in 1754–1755 at the convergence of the Sebasticook River and the Kennebec River in the town of Winslow, Maine (then part of Massachusetts). Massachusetts's Gov. William Shirley ordered the construction of Fort Halifax in 1754 to protect English settlers living along the banks of the Kennebec. The fort was named for George Montague-Dunk, Earl of Halifax, then president of the British Board of Trade and Plantations.

Original plans called for a massive structure with a garrison of 400 men. However, officials later reduced that rather significantly. The final complex consisted of blockhouses, redoubts, barracks, and a large building for officers' quarters and storehouses. Major General John Winslow was Fort Halifax's first commandant. He supervised 300 men who completed the fort's construction.

There were no recorded attacks on Fort Halifax despite skirmishes in the area during the French and Indian War (1754–1763). The fort was decommissioned in 1766. It then became a popular trading post, although navigating the Kennebec River proved difficult, and the post was eventually abandoned. In 1775, during the American Revolutionary War, a force of 1,100 men led by Colonel Benedict Arnold stopped at the fort on its way to Quebec.

Most of the fort was demolished in 1797, although what remained was used by the community of Winslow for a number of years as meeting space, a store, and then a tavern. This site boasted the old-

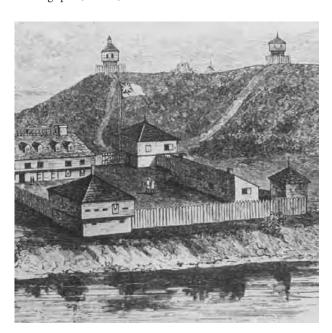

Illustration of Fort Halifax on the Kennebec River, Maine, around 1755. (Library of Congress)

est blockhouse in the United States until it was destroyed by severe flooding in 1987. The fort has since been reconstructed, using some of the original timbers.

Fort Halifax (Pennsylvania)

Pennsylvania post constructed in June 1756 and located half a mile north of present-day Halifax at the mouth of Armstrong Creek along the Susquehanna River. Colonel William Clapham ordered Fort Halifax erected in spring 1756, and Gov. Robert Hunter Morris probably named it for George Montague-Dunk, Earl of Halifax. Square in form and with bastions at each corner, the fort, including bulwarks, measured some 160 feet on a side with 65-foot curtains amid the bastions. Two of the bulwarks held raised platforms, and the post's gate faced westward toward the Susquehanna River. The post contained barracks, a well, and a storehouse at its southern end.

Fort Halifax was one in a chain of posts built as a defensive perimeter and supply system meant to dominate the strategic junction of the Susquehanna River's tributaries. It served as the primary base along the communication line between Fort Augusta at Shamokin and English colonists to the south.

From the start, Clapham confronted problems at Fort Halifax. His isolated soldiers lacked discipline and pay was irregular. As a result disorder and mutiny ensued. Ten men were subsequently court-martialed and several were convicted and sentenced. Following the transfer of some troops to Shamokin, Fort Halifax's garrison counted a captain with a company-sized unit. In October 1757, following complaints that Fort Halifax did not offer effective protection to settlers or serve as an effective way station for boats on the river, the post was evacuated and its garrison removed to Fort Augusta. Fort Halifax was dismantled in 1763.

Fort Hardy (New York)

See Fort Saratoga (New York)

Fort Henry (Pennsylvania)

Pennsylvania post located two miles northwest of present-day Bethel, near the western edge of Berks County. Captain Christian Busse built Fort Henry in February 1756, just as fighting was breaking out along Pennsylvania's frontiers during the French and Indian War (1754–1763). Busse, along with 50 provincial troops, erected the fort close to the Dietrich Six dwelling, situated about 14 miles from Fort Swatara.

Sometimes referred to as Busse's Fort or the Fort at Dietrich Six, its location guarded roads along the Swatara, or Tolihaio, Gap, and protected nearby settlers. Considered the most significant stockade between the Lehigh River and Susquehanna River, Fort Henry sat on a slight elevation and afforded an unobstructed sight of Native American passages from Blue Mountain as well as the westward valley. The post's only purpose was to quarter troops as a base for ranging. Fort Henry was part of a western defensive line for Berks and Lancaster counties, a chain of forts created by settlers prior to the November 1755 approval of militia and appropriation legislation.

Fort Henry's appearance imitated other frontier stockades that included one or more tile-roofed houses inside a walled compound. The fort included palisades and was well built and well run. Its spacious interior allowed the garrison to drill and march within its walls. The source of the post's name remains in doubt. Allegedly, it honored a dignitary of the House of Hanover, perhaps William Henry, Duke of Gloucester and Edinburgh, a sibling of King George III.

The October 1755 Penn's Creek Massacre had provided considerable reason for heightened military readiness. Colonel Conrad Weiser, commander of the Berks County Militia under an October 1755 provisional commission, exercised supervision over the defensive line. By January 1756, Gov. Robert Hunter Morris had granted provincial consent for the Berks and Lancaster defensive line that included Fort Lebanon, Fort Hunter, and Fort Swatara, as well as Fort Henry.

Troops from Fort Henry helped guard the Easton Conference in July 1757. In early February 1758, the post's garrison numbered 89 soldiers. When Major Thomas Lloyd took command in April 1758, the garrison was reduced to 45 men. Reductions to support the Forbes Campaign further depleted the fort's troop strength to just 17 men by December 1758. No troops were posted at the end of the year. Fort Henry was activated again as a patrol station in 1763 during Pontiac's Rebellion.

Fort Henry (Virginia)

There were actually two posts named Fort Henry erected in the Virginia colony. The first was built sometime between 1607 and 1611 at the mouth of Hampton Creek in the Tidewater region; the other was erected in 1646 along the Appomattox River, where modernday Petersburg is located. Both were used mainly for defense against Native American attacks.

The first Fort Henry was named for the Prince of Wales, who was an ardent supporter of the Virginia colonial experiment. The garrison was on the western side of Hampton Creek opposite Fort Charles. Fort Henry was the smaller of the two posts. In 1611, John Clark, a ship's pilot, described Fort Henry as being located a musket shot plus another quarter of a musket shot away from Fort Algernon on Point Comfort. At this time it was equipped with a single, cast-iron gun for defense against native attack.

In 1613, Fort Henry was mentioned by Don Diego de Molina in a letter he penned. Molina had been one of three Spaniards captured in 1611 by the English. He was held at Fort Algernon and described Fort Henry as being half a league from Point Comfort, but smaller than Fort Charles. Fort Henry was garrisoned with a force of 15 soldiers. It apparently lacked cannon.

In 1614, Captain George Webb was commanding both Fort Henry and Fort Charles. He described both as "goodly seats and much corne ground about them, abounding with the commodities of fish, fowle, deere and fruits." He also noted that the two forts were indefensible in the face of a determined attack by European forces.

The second Fort Henry was situated at the falls of the Appomattox River (present-day Petersburg). After the Native American massacre of 1644, Gov. William Berkeley and the Virginia Assembly ordered six forts to be constructed along six key Virginia rivers. Fort Henry was erected by Captain Abraham Wood during 1645–1646 and was sited 11 miles from the mouth of the Appomattox River, where it joins the James River. Garrisoned by 45 men, the fort soon became one of the most important posts in Virginia's line of defenses. It had a blockhouse, storage facilities, and barracks, which were protected by a palisade.

In 1647, Wood was granted permission to convert Fort Henry and 600 surrounding acres into a military trading center. He was required to maintain a garrison of 10 soldiers there for three years. Wood spent 30 years there outfitting explorers and trappers, dying in 1680 as a major general in the militia. By the end of the century, as settlements crept farther west, Fort Henry lost any vestiges of military utility. It slowly evolved into a center of commerce and as an area of settlement that would eventually become Petersburg.

Fort Herkimer (New York)

Also known as Fort Kouri or Fort Dayton, Fort Herkimer is a name associated with several forts built on the banks of the Mohawk River, near the mouth of West Canada Creek, in modern-day Herkimer County, New York. In the early 1700s, German-Palatine immigrants settled the area around Herkimer, effectively extending the existing frontier westward.

Johann Yost Herscheimer (the father of Brigadier General Nicholas Herkimer of American Revolutionary War fame), known as Kouri ("Bear") by the Mohawks because of his imposing physique, constructed a stone house in 1740 on the south bank of the Mohawk River, opposite West Canada Creek. It served originally as a store and trading post and supplied provisions to the British troops at Oswego. Later, Sir William Johnson, the British superintendent of Indian Affairs, had the post extensively fortified.

The two-story house was 70 feet long and 40 feet wide. Its stone walls were 2 feet thick and had loopholes at each story and in the basement. Enclosing the house at a distance of about 30 feet was a ditch 6 feet deep and 7 feet wide. The ditch was lined with palisades, set obliquely, and backed by an earthen parapet. Four small bastions stood at the angles of the parapet. A house near the west parapet served as a barracks and guardhouse.

In 1756, the fort was dismantled, and the stockade, ditch, and parapet, along with an added blockhouse, were then rebuilt around the stone Herkimer Dutch Reformed Church about a quarter mile to the west. This became known as the Herkimer Church Fort. The church itself, begun in 1740, was not completed until 1767. Also in 1756, the British erected a wooden blockhouse on the northern side of the river, which was also called Fort Herkimer. This was abandoned after 1760. During the American Revolutionary War, Patriot forces built a more substantial structure, Fort Dayton, on the north bank site and also refortified the Church Fort with more palisades and earthworks.

The Palatines, discontented with their fate in the English colony, had hoped to maintain a neutral stance in the French and Indian War (1754–1763), but Gov. Pierre de Rigaud de Vaudreuil de Cavagnial, Marquis de Vaudreuil, of New France attempted to turn them against the English. When this failed, a French force of 300 Troupes de la Marine, Canadian militia, and native warriors led by François-Marie Picoté de Belestre moved eastward from Lake Ontario, and raided the settlement of German Flats on the north

bank on November 12, 1757. They killed 40 inhabitants, took about 150 captives, slaughtered livestock, and burned all 60 houses and the barns, mill, and other outbuildings. Believing themselves to be neutral, the Palatines had failed to seek refuge at the Church Fort. Captain Philip Townshend, in charge of 200 troops at the Church Fort, sent a detachment of about 50 to stop the mayhem, but it was too weak to be effective. As Colonel George Augustus, Lord Howe was advancing up the Mohawk River with more troops and militia, Belestre eventually withdrew. Vaudreuil, pleased with the outcome, sent an exaggerated report of the destruction to Paris, and made plans to use the Ontario-Mohawk route again in the future. No combat occurred at the fort itself.

During the American Revolutionary War, both Brigadier General Benedict Arnold and Major General George Washington paid visits to Fort Herkimer, then known as Fort Dayton. In 1812, the deteriorating post was extensively updated, but it was leveled in 1819 to make way for an inland canal.

Fort Hunter (New York)

British fort and mission located on the southern bank of the Mohawk River and the eastern bank of Schoharie Creek (modern Montgomery County, New York). In 1709, three Mohawks, a Mahican, and Peter Schuyler, the mayor of Albany, negotiated an agreement with Queen Anne to allow the construction of a mission fort on a tract of land in the Mohawk Valley at Schoharie Creek. The queen provided a silver communion service and other items for a chapel as well as ministers for "my Mohawk Indians."

At the time this fort represented a new extension of New York's western frontier. A second fort foreseen for Onondaga was never built. The Mohawks in turn agreed that Palatine German Protestants—displaced by war and persecution and then resident in London—could settle there. The fort would thus defend the Mohawks,

the New York frontier, and the Palatines. It eventually formed part of a chain of forts connecting Albany and Oswego. The fort was named for Gov. Robert Hunter.

Fort Hunter, constructed in 1711–1712, was square in shape, 150 feet long on each side, and rimmed with a palisade 12 feet high. Within the palisade was a 5-foot-wide parapet. At each corner stood a two-story, double-loopholed blockhouse, which was 24 feet square and 17 feet high. The blockhouses had room for 20 men apiece and were armed with cannon, the largest of which were 9-pounders.

At the center of the fort stood a chapel named for Queen Anne. The original chapel was a log cabin; however, it was replaced with a stone church in 1741. This was a 24-foot-square structure with an attic and a 15-foot-square cellar lined with logs. The cellar was used as a powder magazine. Also within the walls of the fort were 30 cabins intended for resident Mohawks. A stockaded Mohawk settlement nearby was known as the Lower Mohawk Castle (the Upper Castle being at Fort Canajoharie). A two-story stone parsonage, 25 feet by 35 feet, was constructed a mile east of the fort in 1734. During the American Revolutionary War, the parsonage was also fortified, palisaded, and garrisoned.

Fort Hunter's first commander, Captain John Scott, commanded a 20-man garrison. Captain Walter Butler, the fort commander in 1733, negotiated with the Mohawks for additional land, expanding the tract by 86,000 acres. Sir William Johnson, the British agent for Indian Affairs, established a free school for Native Americans there in 1769.

With time the fort fell into disrepair. In 1773, a fire destroyed one blockhouse and two walls. The palisades and blockhouses were rebuilt at the beginning of the American Revolutionary War. The remnants of the fort were dismantled in 1820 to make way for the Erie Canal. Stones from the chapel went into the construction of a lock along the canal. The parsonage, however, still stands.

Fort Hunter (Pennsylvania)

One of a series of frontier forts established by the English to guard against French incursions along the Pennsylvania frontier. The fort was located along the Susquehanna River just below Fishing Creek and six miles north of another fort at Harris's Ferry. Fort Hunter commanded an important crossing point in the Susquehanna River and provided protection to the nearby town of Paxton. The land was settled by Benjamin Chambers in 1725. He willed the land to

his brother-in-law Samuel Hunter, for whom the fort apparently was named.

With the beginning of the French and Indian War (1754–1763), the English carried out widespread buttressing of their frontier defenses. Reportedly, Fort Hunter was constructed by settlers in the area beginning in late 1755, with the work completed by the Pennsylvania Regiment early the next year. A detachment of 30 soldiers manned the fort.

In 1756, with the construction of Fort Halifax 11 miles up the Susquehanna, Pennsylvania's Gov. William Denny and the British commander in North America, John Campbell, Lord Loudoun, decided that Fort Hunter should be abandoned. When the inhabitants of Paxton objected, Denny rescinded the order. Indeed, in 1757 Fort Halifax was abandoned and Fort Hunter strengthened instead. Fort Hunter withstood several native attacks that same year but thereafter saw little activity.

Fort Hyde (North Carolina)

Fort Hyde, also known as Hyde Fort, was a defensive fortification in colonial North Carolina during the Tuscarora War of 1711–1715. The fort was located at Core Point, or "Cow Towne," on the banks of the Pamlico River. Fort Hyde was situated on the opposite bank across from Bath, the seat of government for the Bath Colony of the Carolina Proprietorship. The works were probably named for colonial governor Edward Hyde, who died of yellow fever on September 1, 1712.

Unlike Fort Reading located at Chocowinity Bay, Fort Hyde was a purely defensive work to protect the seat of the colonial government and provide refuge for neighboring families. The fort remained one of the few locations that were not overrun during the initial attack by Chief Hancock and his native raiders in September 1711. The fort remained a defensive post in the colony as the Carolina colonists prepared to assault the neighboring Tuscarora towns near and along the Pamlico River and Tar River.

The Bath Colony continued to fear another possible native raid especially in light of the general dissatisfaction with the peace terms settled between Chief Hancock and Captain John "Tuscarora Jack" Barnwell. The governor and the council voted to establish a permanent garrison at Fort Hyde on May 10, 1712. This garrison would consist of a commander or officer and 30 men; another 10 men would be dispatched to Fort Reading. The post was to safeguard the

inhabitants along the Pamlico River and Trent River. Fort Hyde continued as the major protective post of the colony as another expedition under the command of Colonel John Moore moved against the Tuscaroras later that year and into 1713.

Fort James (New York)

Post constructed by the Dutch West India Company in 1626 to protect the city of New Amsterdam (now New York City) on Manhattan Island. When the states-general of Holland granted a charter to the Dutch West India Company in the early 1620s, it called on Manhattan Island to be the center of the permanent New Netherland colony. The Dutch settlement, known as New Amsterdam, was located at the southern end of Manhattan Island.

In 1625, Cryn Fredericksz van Lobbrecht, a military engineer and surveyor, designed a bastion named Fort Amsterdam. Construction began the next year when Dutch leader Peter Minuit secured a lease from the Manhattan tribe for possession of the island. The directors of the Dutch West India Company sought to protect the entrance to the Hudson River and to consolidate in New Amsterdam both trade operations and a majority of the colony's settlers. Initial plans called for the construction of a large fort, but with relative peace with the Manhattans and no threat from foreign powers, the design was scaled back. Constructed by 1628, the fort was of earth and had four bastions and mounted several cannon.

Fort New Amsterdam remained at the center of New Netherland's activities. The company's directors lived within its walls and all council sessions were held there. When disputes arose with the Native Americans, the residents of New Amsterdam sought its protection.

During the Second Anglo-Dutch War (1664–1667), the English mounted a surprise attack against the fort on September 24, 1664. Although Director General Petrus Stuyvesant was prepared to resist, Dutch settlers refused to fight and English control was established over New Netherlands.

In the aftermath of the Second Anglo-Dutch War, the English levied a special tax on the residents of New York in 1670 to rebuild the fort, which was renamed Fort James after the Duke of York (later King James II). The fort was still in disrepair, however, when in August 1673, during the Third Anglo-Dutch War (1672–1674), the Dutch recaptured Fort James, then manned by only 60 men, and

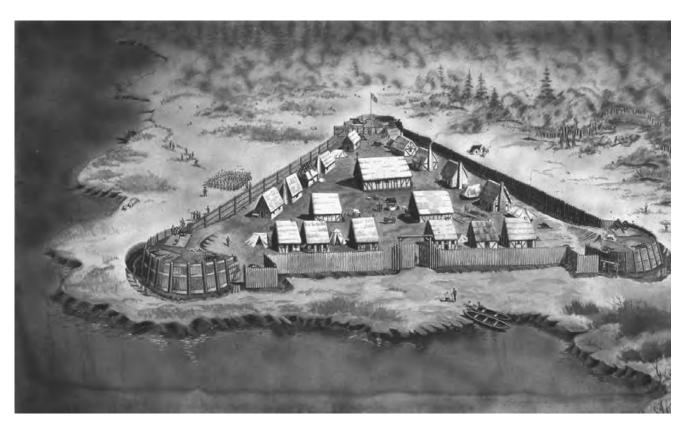

Illustration of Fort James at Jamestown in Virginia, the first permanent English settlement in North America. (MPI/Getty Images)

renamed it Fort William Hendrick. The British prevailed in the war, however, and the settlement and fort reverted back to English control. In 1683 the fort was the location for the meeting of New York's first legislative assembly.

In 1714, the fort was renamed Fort George after the new king. In 1776, during the American Revolutionary War, Fort George was totally destroyed. Today, the site of the fort is marked by the Old Custom House building at the end of Broadway, across from Battery Park in New York City.

Fort James (Virginia)

Fort constructed at the site of the first English settlement in Jamestown in 1607. The garrison was erected roughly 45 miles upstream from the mouth of the James River, on a swampy peninsula. On May 12, 1607, after almost five months at sea, English colonists landed on an island located some 40 miles up the James River from the Chesapeake Bay. James Island was connected to the mainland by a narrow isthmus, which was defensible against Native American attacks by land or amphibious attacks by rival European powers.

During their first two weeks on James Island, the colonists attempted to establish friendly relations with the natives. When the Powhatan Confederation responded to the settlers with a mixture of caution and occasional hostility, however, they quickly built a fort they called James Citie Forte, or Fort James, as it is known today. The fort would be rebuilt twice at the same location.

The local Paspahegh tribe (part of the Powhatan Confederation) attacked Jamestown in late May 1607, as the fort was still being constructed. Indeed, at the time of the raid, the "fort" was a barely fortified encampment. The attack killed a young boy and wounded several other settlers.

By June 15, 1607, the colonists had completed Fort James. The log fort was a walled, 14-foot palisade embedded in a trench. There were circular bulwarks—or watch towers—at each point of its triangular shape. Several brass cannon, believed to be 9-pounders, were mounted on the walls. Within the fort's walls were a storehouse, chapel, and barracks. In the winter of 1608, the English

added to the fort and essentially rebuilt it to make it more impervious to attack.

In the spring of 1610, Gov. Sir Thomas West, Third Baron De la Warr, arrived at Jamestown to discover that much of the fort had been burned for fuel during the "Starving Time" of the winter of 1609–1610. Indeed, the severe winter weather and food shortages had nearly wiped out the colony. William Strachey, secretary of the colony, recorded in May 1610 that the palisade had been ripped down and the gates were off their hinges, and many of the surrounding houses whose owners had died during the winter had been torn apart for firewood. To make matters worse, natives under the orders of Chief Powhatan had laid siege to the fort. By winter's end, more than 100 of the 200 settlers had died of starvation, disease, and exposure.

West decided to rebuild the fort. According to Strachey, the new fort's southern line was 420 feet long and was the longest and best defensive line because it faced the river. The two landward sides were 300 feet long. As with the former fort, each point of the triangular post had a bulwark with artillery. Fort James was critical because the colonists were at war with Native Americans from just before the injured Captain John Smith returned to England in 1609 until the marriage of John Rolfe to Powhatan's daughter Pocahontas in 1614.

On May 22, 1622, Native Americans launched surprise attacks on the colonists, hoping to wipe them out. The Second Anglo-Powhatan War (1622–1632) resulted in the death of hundreds of settlers. Those who could find shelter in the growing number of fortifications usually survived, and Jamestown resisted the attacks.

In the 1660s and early 1670s, Dutch fleets attacked English ships and installations in the Chesapeake Bay area. Gov. Sir William Berkeley strengthened Fort James in 1664, but it still lacked the large cannon necessary for adequate defense against European powers. Jamestown was, however, captured and burned by Nathaniel Bacon during Bacon's Rebellion (1676–1677). By the time the colony's capital was relocated to Williamsburg, the fort at Jamestown was no longer in use and had fallen into disrepair. In 1861 a Confederate fort was built on the site of Fort James, virtually obliterating its remains. Today it is part of the U.S. National Park system.

In 1645, a garrison also named Fort James was built on the Chickahominy River near present-day Lanexa in New Kent County, about 20 miles west of Williamsburg. The post was a new fortification in the Pamunkey region built for security following hostilities initiated by Chief Opechancanough. In 1646, Lieutenant Thomas Rolfe, the son of Pocahontas and John Rolfe, was given a grant to the fort and 400 acres of land beside it for a period of three years.

In the late 1660s another fortification, also named Fort James, was erected on Tyndall's Point. The site today is on Gloucester Point, which is across from Yorktown in Gloucester County.

Fort Johns (New Jersey)

Garrison erected in 1756 designed to offer a sanctuary for area settlers, located on the Old Mine Road overlooking the Shapanack Flats and the Delaware River in Sussex County, New Jersey. Also known as Fort Shapanack and John's Fort, the post had a 120-foot-square palisade with bastions in three of its corners and a log cabin in the fourth. Adjoining the palisade, on the outside, was a 50-by-24-foot wooden blockhouse with a stone foundation. Within the palisade stood a 15-by-20-foot log house and a 20-by-57-foot stone dwelling.

The Fort was designed to accommodate 100 or more soldiers. The Van Campen Inn (constructed in 1742), down the hill from Fort Johns, could accommodate an additional 150 people if needed. The Old Mine Road, named for a copper mine being developed in the 1750s, ran along the river and from there to Kingston, New York. Intersecting this road at Fort Johns was the Military Road, opened in 1756, over which supplies were brought approximately 60 miles from Elizabeth Town (now Elizabeth, New Jersey).

Fort Johns served as the headquarters for the defensive line along the Delaware River authorized by the New Jersey legislature in December 1755. This was a response to attacks by the Delawares, who had sided with the French in the French and Indian War (1754–1763). It was also a refuge for local settlers and served as a military post until the end of the American Revolutionary War. The fort may have been named for John Rosencrans, a local militia captain and the owner of the original dwelling, or John Stevens, the builder of the fort, or perhaps John Johnston, the designer of the Delaware River forts.

An outline of the fort sketched in 1758 by Captain Jonathan Hampton, quartermaster for New Jersey's frontier defenses, was preserved and can still be viewed today. The site is now part of the Delaware Water Gap National Recreation Area. Archaeological investigations were undertaken in 1975 and again during 1998–2000.

Fort Johnson (New York)

British fort constructed in 1748–1749 along the Mohawk River roughly 25 miles west of Schenectady, New York. Also known as Mount Johnson, Fort Johnson was the original three-story limestone house of Sir William Johnson, superintendent of Indian Affairs and hero of the Battle of Lake George during the French and Indian War (1754–1763).

Johnson, an Irish immigrant from County Meath, came to the American colonies in 1738 to oversee his uncle Peter Warren's land holdings in the colony of New York. In 1739, Johnson bought a tract of land north of the Mohawk River and began building his own house. His first house, which he named Mount Johnson, was completed in 1743.

Mount Johnson's proprietor developed a successful fur trade. Johnson also established strong relations with the Native American tribes, particularly the Mohawks. Learning their languages and dressing in their clothing, Johnson met the Native Americans in his home and worked hard at preserving their lands from settlers moving into the Mohawk Valley. His relationship with the Native Americans enabled him to acquire large land holdings, mainly gifts from the Mohawks. In time, he became one of the richest men in the American colonies.

Deciding to build a larger house, and acting as his own architect, Johnson constructed a large three-story limestone dwelling about a mile west of his first home. The house followed the Georgian style of architecture with high ceilings, tall windows, and spacious rooms with fireplaces. Completed in 1749, Johnson named his new home Fort Johnson. The grounds included the house, grist mill, and outbuildings.

There were also structures flanking the house in front. The flanking structures were fortified to defend against attacks by the French and their native allies. Sometime in 1756 Johnson added cannon and a stockade to the complex. Two years later, two blockhouses went up at opposite ends of the site.

In 1754, while serving in the New York colonial legislature, Johnson led negotiations with the Native American tribes at the Albany Conference. During the French and Indian War, Johnson's militia successfully defeated the French at the 1755 Battle of Lake George. His home served as his military headquarters and after his victory, he was commissioned as superintendent of Indian Affairs for the region north of the Ohio River by the Crown in 1756. All Indian affairs were conducted from his office in the house.

Acquiring even more land and wealth, Johnson moved from the fort to his new home, Johnson Hall, in 1763. He gave Fort Johnson to his son, John, who lived there until 1774. During the American Revolutionary War, Fort Johnson was confiscated in 1777 by the nearby Tryon County Committee of Sequestration because of Johnson's Loyalist sentiments. All its furnishings were sold at auction.

Today, Fort Johnson is a museum under the auspices of the Montgomery County Historical Society.

Fort Johnson (South Carolina)

Johnson. Westport, CT: Praeger, 2000.

British fort built in 1704 at Windmill Point on James Island that overlooked the southeast side of Charles Town Harbor. Fort Johnson was situated approximately two miles from the town of Charles Town (present-day Charleston, South Carolina). When first constructed, it was composed of stockade fences and earthworks, along with heavy cannon pointing toward the harbor entrance. Fort Johnson was built in a triangular shape with three bastions, and it featured as building materials mud, pine saplings, and oyster shells. Land-based defenses boasted a heavy gate, a dry moat, drawbridges, and a glacis.

The post was named after the aggressive and strong-willed governor of the colony, Sir Nathaniel Johnson. Worried about the prospects of war with Spain and its powerful fortress at St. Augustine threatening English settlements along the Carolina coast, Johnson had ordered the construction of a fort by the harbor to protect Charles Town. In 1708, the colonial government took control of the fort. Throughout the following decades, Fort Johnson was never well maintained. A devastating 1752 hurricane and the onset of the French and Indian War (1754–1763) saw the refurbishment of the fort and its fortifications.

In 1759, when the Anglo-French rivalry was reaching its climax, the fort's walls and bastions were further reinforced. However, the fort saw no action. Although it was located in an important strategic location, the reality was that if enemy ships were to penetrate the harbor's mouth, the city would have been lost to the invaders. The fort was nonetheless garrisoned from the early 18th century to the conclusion of the American Civil War.

The Stamp Act crisis of 1765–1766 saw Fort Johnson serve as a safe house. The inhabitants of Charles Town vigorously protested the arrival of the stamps to the southern colony. Fearing a popular uprising in the streets, Lt. Gov. William Bull sent the despised

stamps to the fort for safekeeping. Fort Johnson's garrison was temporarily strengthened and the stamps remained there until Parliament rescinded the legislation in March 1766. Rebellious colonials seized Fort Johnson at the start of the American Revolutionary War in September 1775, although the fort did not play a major role during the conflict.

Throughout the 18th and much of the 19th centuries, the fort developed according to the needs of the times. Prior to the War of 1812, Fort Johnson was strengthened in anticipation of British naval attacks. By 1830, the fort was nearly in ruin. Before the start of the Civil War, several permanent buildings were added to the site.

Confederate forces seized the fort on January 2, 1861. It was from here that the first signaling mortar shell was fired to open the bombardment of Fort Sumter. July 2, 1864, saw Fort Johnson's final military encounter, when Confederate troops there repelled a large force of Union troops. In early 1865 the fort was evacuated as Union troops arrived.

After 1865, the fort fell into ruin. Today, the 90-acre tract of land is on the National Register of Historic Places and houses research facilities for various state and national government agencies.

Fort Johnston (North Carolina)

Fort Johnston was situated on the lower Cape Fear River near the modern-day town of Southport (Smithville), North Carolina. The fortification was to protect the lower Cape Fear River and to control river traffic between Wilmington and the town of Brunswick.

After a Spanish warship captured some English colonial vessels off of Cape Fear in 1741 during the Anglo-Spanish War of 1739–1744, the North Carolina General Assembly voted in 1745 to construct a post called "Johnston's fort" to block enemy access to the river, as the conflict with Spain had expanded into King George's War (1744–1748). The post was named after the colonial governor, Gabriel Johnston. It was to be constructed of "tapia" masonry and be armed with 24 cannon.

During the fort's construction in 1748, three Spanish privateers ventured up the Cape Fear River and attacked the town of Brunswick. Many area residents sought refuge in the unfinished post. The fort was finally completed the next year and armed with four old cannon.

Throughout its existence, the fort was either strengthened or allowed to decay depending on the military threat to the colony. With

the beginning of the French and Indian War (1754–1763) and the possibility of a French naval attack, the North Carolina General Assembly voted in 1754 to appropriate £2,000 to reinforce the works. Gov. Arthur Dobbs also requested arms and ammunition from Britain to equip the fort, but when the arms finally arrived in 1758, the fort was in ruins. Troops from its garrison had frequently been withdrawn to serve elsewhere during the war; some of them served in Brigadier General John Forbes's 1758 expedition against Fort Duquesne.

At the start of the American Revolutionary War in 1775, North Carolina's last royal governor, Josiah Martin, took refuge in Fort Johnston after local Patriots drove him from office. He escaped on a British warship shortly afterward, and Patriot forces destroyed the fort. When British troops occupied Wilmington early in 1781, they repaired and garrisoned the post, but evacuated it eight months later. Fort Johnston was repaired and garrisoned by American forces during the War of 1812 and by Confederate troops during the American Civil War. It is presently home to the Sunny Point U.S. Military Ocean Terminal.

Fort Kanadesaga (New York)

British fort constructed in 1756, located one and a half miles northwest of the present-day city of Geneva, New York. Also known as Fort Canadasaga, Fort Kanadesaga consisted of a 17-foot-high log palisade enclosing an area 150 feet square. Blockhouses, each 24 feet square, were located in two diagonal corners. About one mile away, the outlet of Seneca Lake formed a 20-foot-wide rapid that some held to be a natural site for an ambush. The fort was situated near a Seneca village called Kanadesaga, which by the 1770s had more than 60 longhouses.

The fort was built under the direction of Sir William Johnson in May 1756. The post was part of an effort to persuade the Senecas and other Native Americans of the Iroquois Confederation to join with the English in the French and Indian War (1754–1763). Each of the Iroquois Nations except the Cayugas had agreed to the construction of a fort adjacent to its principal village.

The purpose of the fort was ostensibly to protect the natives from the French. In return, the Iroquois promised to stand by the English in the war. Indeed, the Iroquois entered the war only in 1759, when they feared further erosion of their influence among the increasingly independent Delawares and Shawnees of the Ohio Country. During the American Revolutionary War, the Sullivan-Clinton expedition destroyed Fort Kanadesaga and the adjacent village on September 17, 1779. In 1975, historians and archaeologists excavated the site and ascertained considerable facts about the fort.

Fort Kiburn (Connecticut)

See Litchfield Forts (Connecticut)

Fort King George (Georgia)

First colonial garrison built in Georgia by the British in 1721, located on the north bank of the Altamaha River, not far from modern-day Darien, Georgia. Fort King George served as the first line of protection for South Carolina against the Spanish in Florida and their native allies from 1721 to 1727. From its beginning, South Carolina claimed what later came to be the colony of Georgia as part of its territory.

The Spanish, based in Florida, also laid claim to the area. St. Augustine served as the primary settlement for Spanish Florida, and the garrison there was supported by the Guales, the Timucuas, and the Yamasees, who had previously lived in coastal and southern Georgia. These tribes and the Spanish hoped to one day regain control of coastal and southern Georgia.

As a result of the Spanish-native threat as well as a potential challenge by the French at Fort Toulouse in Alabama, the South Carolina government charged Colonel John C. "Tuscarora Jack" Barnwell with the task of defending this disputed area. Thus, Barnwell established a fort near the mouth of the Altamaha River and called it Fort King George in 1721. Barnwell intended Fort King George to be the first in a chain of fortifications along the frontier to prevent the intrusion of the Spanish or French into British territory and to keep native peoples in check. This plan never came to fruition, however, and the British finally abandoned Fort King George in 1727, moving its garrison to Beaufort, South Carolina.

The fortification itself consisted of a blockhouse made from cypress logs, barracks, and earthen walls reinforced with a wooden palisade. Fort King George was garrisoned by His Majesty's Independent Company. Those assigned to the fort faced isolation, a hot and oppressively humid climate, and a poor diet. These conditions often led to the outbreak of disease, and the garrison remained constantly under threat of attack by the Spanish and various Native Americans. These severe conditions eventually led to the abandonment of the fort in 1727.

After the founding of Georgia in 1733, Gov. James Oglethorpe in 1735 settled a colony of Scottish Highlanders at the site of Fort King George in hopes of securing the southern frontier of Georgia. However, the colony found the site undesirable and later moved farther up the Altamaha River to establish Darien.

Fort Kouri (New York)

See Fort Herkimer (New York)

Fort La Bahia (Texas)

Spanish presidio founded in 1721 and located near the Gulf of Mexico in present-day southeastern Texas. Fort La Bahia, also known as Nuestra Señora Santa Maria de la Bahia del Espritu Santo, was originally established by the Spanish on Matagorda Bay on the west bank of Gracitas Creek in present-day Victoria County, Texas. Captain Domingo Ramon founded the presidio on April 4, 1721, on the ruins of Fort St. Louis. That redoubt was a French stronghold established by the French explorer René-Robert Cavelier, Sieur de La Salle, in 1685. The Spanish erected the post to protect the Nuestra Señora del Espiritu Santo de Zuniga Mission. The Spanish also established the mission and presidio to prevent any further French encroachment along the coastline of Texas, as well as to protect the local Karankawa people.

Throughout its history, the presidio went through many changes. A year after its founding, Marques de Aguayo began construction of the permanent presidio. At the presidio, relations between Native Americans and the soldiers were troubled, a not unusual occurrence for such places. Indeed, by 1726, relations with the Karankawas had deteriorated to the point that the Spanish left the site along the bay and rebuilt both the mission and presidio 26 miles inland. There they hoped to convert and protect the Aranama tribe.

At this location, the presidio prospered for 23 years. In 1749, the presidio moved again to the present-day city of Goliad, Texas. Here the chief function of the stronghold was to protect the road to San Antonio from highwaymen.

The main duties of the soldiers now included escorting convoys, the supply trains traveling from San Antonio to the Rio Grande River, and guarding the surrounding area from Lipan, Apache, and Comanche attacks. Unlike many of the Spanish colonial presidios, Fort La Bahia's history did not end with New Spain. Rather, it continued to serve the area even after Mexico and Texas gained their independence in the early 19th century. La Bahia still exists today in Goliad and is owned and operated by the Catholic Diocese of Victoria County.

Fort La Galette (New York)

See Fort La Présentation (New York)

Fort La Pointe (Wisconsin)

Principal French trading post on Lake Superior, built in 1718 at or near the same site of France's Fort St. Esprit (1693–1698) in La Pointe, Madeline Island, Wisconsin. Madeline Island is the largest of the 22 islands that comprise the Apostle Islands archipelago and was populated by the Ojibwas when the French explored the area around 1620. During 1655–1656, two French explorers and fur traders, Pierre d'Esprit Radisson and Medard Chouart de Groseillier, made their way to Chequamegon Bay and contacted the Ojibwas. In their wake, a French Jesuit mission known as St. Esprit was established next to the Ojibwas' village on Madeline Island in 1660. Father Claude Allouez hoped to use the location on Lake Superior not only to reach out to the Ojibwas, but also to the Huron and Ottawa converts in the area.

At this time, the entire region was plagued by starvation and warfare, and several tribes were constantly on the move in search of food and shelter. Between recurrent Iroquois raids, competition for resources around the lake had the refugee tribes fighting one another over hunting territory. Some displaced Wyandots and Ottawas settled near the mission, and several villages of the Ojibwas, the Illinois, the Nadouessis, the Assinipoualacs, and the Dakotas were in the surrounding area.

In 1671, Father Jacques Marquette, who had replaced Allouez, was no longer able to pacify the various tribes and was forced to abandon his mission when the Sioux declared war against the French. In 1693, the French established a fort and trading post near the former site of the mission and called it Fort St. Esprit, with the hope that it could keep the northern route open for French trade. However, Fort St. Esprit lasted only five years.

After Queen Anne's War (1702–1713), the governor of New France, Philippe de Rigaud, Marquis de Vaudreuil, hoped to pacify the tribes in the Great Lakes region and to reestablish French military posts in the area. Thus, in 1718, Paul Legardeur, Sieur de St. Pierre, was ordered to rebuild a fort in Chequamegon Bay. He chose the site of the former Fort St. Esprit. He named the new fort La Pointe. It served as the principal French trading post on Lake Superior for almost 40 years. The fort was abandoned in 1759, when the French left the region. In 1765, a British trading post named Middle Fort was established nearby.

Fort La Présentation (New York)

A French (later English) fort built in 1750 where the Oswegatchie River joins the St. Lawrence River at present-day Ogdensburg, New York. The fort was constructed in the shape of a square with earthen palisades 70 feet long and a blockhouse at each of its corners, which was armed with five small cannon. There was also a moat around the structure. Located above the rapids of the St. Lawrence River and thus accessible to the Great Lakes, the fort served the multiple purposes of strengthening France's claim to the territory; preventing English movement down the St. Lawrence; diverting the fur trade away from the English fort at Oswego, on Lake Ontario; and instructing and converting the Iroquois in the hope of winning them over to the French side.

Abbé François Picquet, a Sulpician missionary known as the Apostle of the Iroquois, first viewed the site on November 21, 1748, which according to the Roman Catholic calendar was the Feast of the Presentation of the Blessed Virgin, and so the fort was later named for that day. Picquet, who saw no contradiction in serving both evangelical and military ends, began construction of a fort and settlement there on May 30, 1749. Mohawks burned the initial stockade that same year, but the final structure was completed in 1750. Picquet reported in 1751 that he had attracted 396 Iroquois converts, who

were settled in three villages near the fort. By the mid-1750s there were some 500 converts, with some estimates running much higher.

During the French and Indian War (1754–1763), Fort La Présentation served as a source of intelligence collection on the Iroquois Confederation and as a base for the launching of raids. In 1755, representatives from the Onondagas came to Fort La Présentation to assure the French that the Iroquois Confederation would remain neutral. Meanwhile, Gov. Pierre de Rigaud, Marquis de Vaudreuil, assigned a military commander, Captain Claude-Nicholas de Lorimier de La Rivière, along with 20 to 30 soldiers to the fort, but it was Picquet who drilled the Iroquois in military exercises.

In 1756, Picquet and the Iroquois converts participated in a raid that destroyed Fort Bull (near Oneida Lake, New York), which disrupted plans for an English offensive, and their planned attack on Oswego. Because of jurisdictional disputes with Lorimier, Picquet was withdrawn from duty in March 1757. The next year, however, he returned in response to Iroquois demands and Lorimier was replaced. In July 1758, Picquet led his converts in the Battle of Ticonderoga.

By 1759, however, the French position generally was crumbling. The Iroquois Confederation finally entered the war on the side of the English, helping convince the converts that the tide had changed against the French. Fort La Présentation, suddenly appearing indefensible, was abandoned.

The English took possession of the site in August 1760 and constructed Fort Oswegatchie there. In the Treaty of Oswegatchie, France's native allies promised to remain neutral for the remainder of the war, and Sir William Johnson, British superintendent of Indian Affairs, promised to deliver to them the possession of their lands, the free exercise of their Catholic faith, and not to treat them as enemies after the war.

With the French vanquished, the fort lost much of its military significance and was of use primarily to fur and lumber interests until the American Revolutionary War. Samuel Ogden purchased much of the site in 1792, and England relinquished the fort to the United States under the terms of the 1796 Jay Treaty.

Fort Lawrence (Nova Scotia)

British fort constructed between late 1750 and early 1751 on the site of the abandoned Acadian village of Beaubassin on the Chignecto

Isthmus in Nova Scotia. Fort Lawrence played a key role in Britain's consolidation of authority over Nova Scotia and the eastern borderlands of New France during the French and Indian War (1754–1763).

The British built the fort after two military expeditions by Major Charles Lawrence in the spring and fall of 1750 failed to drive the French from their position at Point Beauséjour on the western edge of the contested Chignecto Isthmus. Unable to dislodge his adversary, Lawrence positioned his picketed fort less than three miles from France's more substantial Fort Beauséjour, commencing a five-year standoff over the limits of British authority in the region. Fort Lawrence was a palisaded, quadrilateral garrison featuring two blockhouses and two platforms to accommodate small cannons.

Although modest in size and often poorly supplied, Fort Lawrence played host to key moments in the early French and Indian War. In 1754, Fort Beauséjour's commissary, Thomas Pichon, began making visits to British officers at Fort Lawrence. Upset by a series of thwarted promotions, Pichon delivered key details on French troops, leaders, and fortifications. Channeled through the British military, the information likely aided the joint Anglo-American army that, in the summer of 1755, laid siege to and took Fort Beauséjour. Later that fall, during the British campaign to capture and deport the Acadian population of Nova Scotia, Fort Lawrence served as a holding station for the detainees. One Massachusetts soldier reported that on the "stormy dark night" of October 1, 1755, 86 Acadians dug under the fort's wall and escaped. As the forced expulsion progressed and Acadian resistance intensified, British forces made increasing use of the more solid Fort Beauséjour, now renamed Fort Cumberland. Fort Lawrence fell into disrepair and was soon destroyed altogether.

Fort Lebanon (Pennsylvania)

Garrison built in January 1756 and located at the forks of the Schuylkill River on a ridge in the Blue Mountains, roughly two miles northeast of Auburn, West Brunswick Township, Schuylkill County, Pennsylvania. Fort Lebanon, supported by an outlying base at Northkill (near Shartlesville), was Pennsylvania's only fort north of Blue Mountain. Named Lebanon for unknown reasons, the

fort was built by Captain Jacob Morgan between December 1755 and January 1756. Its timber stockade measured 100 feet square with walls 14 feet high. Erected in three weeks, the post enclosed a barracks, store, and two structures for sheltering local settlers.

Fort Lebanon was a link in a six-post chain of strongholds established to provide provincial defense for Berks and Lancaster counties (now Berks, Dauphin, Lebanon, and Schuylkill counties). Local residents created the network in response to the October 1755 Penn's Creek Massacre. Once appropriate supply legislation passed in November, Colonel Conrad Weiser, commander of the Berks County Militia, directed the construction of the fort, which began in late December 1755. By January 1756, Gov. Robert Hunter Morris and provincial commissioners had authorized more specific measures to fortify the region. Each post was situated to cover a passage through the Blue Mountains.

Captain Morgan was Fort Lebanon's commander throughout. An officer of a Berks County Militia unit, in December 1755 he was assigned to the provincial forces. By early 1756, Native American raids had begun to menace local settlers. In one instance, three structures were razed, a woman killed, and a child taken captive. In May 1756, Morgan's unit was incorporated into the new 1st Battalion of the Pennsylvania Regiment.

Fort Lebanon was later rechristened Fort William at an unknown date. A July 17, 1757, letter by James Read refers to the fort as "William," with the name in regular use thereafter. But the *Pennsylvania Gazette* of September 1, 1757, still gave its name as Fort Lebanon. The new name could have originated in deference to William Augustus, Duke of Cumberland, King George II's only surviving male child.

Fort Lebanon's base, Northkill, was abandoned in September 1757. By then, fewer patrols were needed to range among the posts of the Berks and Lancaster defense line. By May 1758, Fort Lebanon (now Fort William) had been evacuated.

Fort Le Boeuf (Pennsylvania)

French fort built in 1753 at the headwaters of La Rivière au Boeuf (French Creek), a tributary of the Allegheny River situated north of the Forks of the Ohio. Although the fort was initially constructed to serve mainly as a storage facility, the French nonetheless fortified it

Major George Washington travels 500 miles on horseback in 1753 to Fort Le Boeuf to deliver a warning to the French to stay out of the Ohio River Valley. (Library of Congress)

to withstand Native American raids as well as British attacks. Fort Le Boeuf was square in design with bastions situated in each corner, which were made of wooden pickets. Log barracks also served as buttresses for the post's curtainlike walls. It is believed that the structure enclosed nine small buildings, which included a powder magazine and a small church. Immediately outside the compound was a stockade that served as a camping and staging area. There were also several storehouses within the stockade. Work on the fort commenced in July 1753 under the supervision of Captain François Le Mercier.

As the French and Indian War (1754–1763) grew closer, Virginia's Lt. Gov. Robert Dinwiddie ordered Major George Washington to carry a letter to the French at Fort Le Boeuf on October 30, 1753. Washington had also been ordered to confer with Native Americans along the way in an attempt to gain their support against the French. En route Washington secured the services of a guide named Christopher Gist, and they arrived in Logtown on November 26. There they met with several native chiefs, including Chief Tanaghrisson (also know as Half-King) of the Mingos. At first Tanaghrisson would not allow the French or British to build forts in the Ohio Country. After several days of negotiations, however, he finally agreed to allow the British to build a fort at the Forks of the Ohio. He also agreed to personally escort Washington to Fort Le Boeuf.

From Logtown, Washington's party traveled to Fort Machault (Pennsylvania), arriving there on December 4. During the three days

they spent there, the French attempted without success to sway Tanaghrisson to their side. From Fort Machault, Washington's entourage traveled four more days before arriving at Fort Le Boeuf in a snowstorm on December 11. Washington delivered the letter to the commander of the fort, Captain Jacques le Gardeur de Saint-Pierre. Saint-Pierre also tried to persuade Tanaghrisson to join the French cause. After three days the French gave Washington a letter for Dinwiddie, stating that the French would not leave the Ohio Country. On December 16, Washington's party, save for Tanaghrisson and four other Mingos, left Fort Le Boeuf for Williamsburg, Virginia. This exchange between the two colonial powers essentially set the stage for the French and Indian War—particularly in the Ohio River Valley.

The French controlled Fort Le Boeuf throughout much of the French and Indian War. With the fall of Fort Niagara (New York) on July 25, 1759, the French were no longer able to support Fort Le Boeuf and ordered the garrison to evacuate it. The retreating French burned the fort.

In 1760, the British constructed a new garrison near the ruined Fort Le Boeuf. During Pontiac's Rebellion (1763), a band of Seneca warriors attacked the British post on June 18, 1763. During the night, the garrison of 14 men escaped, making their way to Fort Pitt. The British then chose to abandon their garrison at old Fort Le Boeuf.

Fort Lévis (New York)

French garrison constructed in 1759 on Isle Royale (present-day Chimney Island), in the St. Lawrence River between Montreal and Lake Ontario. The site is just east of modern-day Ogdensburg, New York. Captain Jean Nicolas Desandroüins, an engineer, designed the fort and began its construction in August 1759.

Built to command the upper St. Lawrence River, Fort Lévis was a square structure built of logs. It had four bastions, barracks, and a magazine. The fort was later improved with a breastwork around the island and an abatis that extended into the water. Reportedly the fort was armed with 35 cannon and could hold a garrison of 330 men.

After the fall of Fort Niagara on July 25, 1759, Major General Jeffery Amherst ordered Brigadier General Thomas Gage, who had just taken command of the British forces at Fort Oswego, to capture Fort Lévis. Supply problems delayed Gage and eventually led him to cancel plans to move against the fort that year.

During the campaign of 1760, however, Amherst took command of a force of almost 11,000 men against Fort Lévis. The offensive was part of a three-pronged attack on the city of Montreal. Amherst's advance took him down the St. Lawrence River toward the fort, which was defended by approximately 400 men and two gunboats, all under the command of Captain Pierre Pouchot.

Amherst's attack on the fort began on August 10, 1760. By that time, one of the French gunboats had been lost when it ran aground. On August 17, employing armed bateaux, the British attacked the other gunboat. After exchanging shots with it, the British bateaux closed on the gunboat in an attempt to board it. However, before the British could do so, the French commander surrendered it to the British. Once the remaining French gunboat had been taken, the British were able to pass the fort and cut it off from Montreal. Once the British had severed Fort Lévis from resupply, they laid siege to it.

The British bombardment of the fort began on August 23. The British used cannon from shore and on bateaux and gunboats that had joined the expedition. The French were able to drive off the British vessels during the initial bombardment but could not neutralize the British shore batteries. Following two days of bombardment, Pouchot surrendered what little remained of the fort. Once Fort Lévis had been taken, Amherst rebuilt it and renamed it Fort William Augustus before continuing on to Montreal.

Fort Lewis (Virginia)

There were two fortifications named Fort Lewis built in Virginia, both in the western part of the colony. The first was built sometime between 1750 and 1757 by Colonel Charles Lewis; the second was constructed in 1756 by Major Andrew Lewis. The first structure was located on the Cowpasture River in Bath County, south of present-day Williamsville. After his marriage in 1762, Charles Lewis (the son of the founder of Staunton, Virginia) built a manor house beside the fort. He called the stockade around his home Fort Lewis,

although others referred to it as "Lewis's Hog Pen." Lewis, a militia colonel, was killed on October 10, 1774, in the Battle of Point Pleasant (West Virginia).

The second Fort Lewis was erected in 1756 by Major Andrew Lewis and was located near present-day Salem, Roanoke County, Virginia. On July 27, 1756, a Council of War at Augusta Court House specified that a fort be built that would be 60 feet square with two bastions and garrisoned by 50 men. The post was also called Campbell's Fort because it was built on land owned by James Campbell. It was garrisoned at first by just 30 men, and Lieutenant Colonel George Washington may have been its commander for a time.

In 1760, during the Cherokee War (1759–1761), a major conflict on the southern mountain frontier, men of Colonel William Byrd III's 1st Virginia Regiment assembled at Fort Lewis for an expedition against the Cherokees, who were besieging Fort Loudoun (Tennessee).

Fort Ligonier (Pennsylvania)

British garrison built in 1758 during the French and Indian War (1754–1763) and located along Loyalhanna Creek, approximately 45 miles west of Fort Bedford, Pennsylvania. In early 1758, Brigadier General John Forbes ordered construction of a "Post at Loyalhanna" as part of his protected British advance to capture Fort Duquesne. Fort Ligonier was the last in a chain of fortified posts that ran along the road constructed by Forbes's troops through the wilderness of southern Pennsylvania. The garrison was 50 miles from Fort Duquesne and served as a supply depot and staging area for the approximately 5,000 British and colonial troops preparing to attack that place.

The wooden stockade fort was completed in September 1758 and was square in shape with bastions in each corner. The encampment was also surrounded by large, wooden pentagonal retrenchments that encircled the fort and several troop encampments. Reportedly, the interior measured 200 feet per side and housed two storehouses, a mess, and an officers' quarters.

On October 12, 1758, the garrison, commanded by Colonel James Burd, sustained an attack by some 1,200 French soldiers and several hundred Native American allies. The battle lasted approximately four hours, with the attackers sustaining heavy losses, after which they broke off the assault. After Forbes captured Fort Duquesne in November, he renamed the fort at Loyalhanna "Ligonier" after his commander in chief in Great Britain, General Sir John Ligonier.

Fort Ligonier served as a garrison for eight years. During Pontiac's Rebellion it provided a vital link in maintaining communications and the passage of supplies to Fort Pitt. Ligonier withstood attacks by Native Americans prior to the English victory at Bushy Run in August 1763. In March 1766, the British decommissioned Fort Ligonier from active service and placed it under the civil administration of Arthur St. Clair.

A reconstructed Fort Ligonier, located in Ligonier, Westmoreland County, Pennsylvania, was erected in 1954 after extensive archaeological excavations, and now boasts nine buildings for visitors. The reconstructed fort is on the National Register of Historic Places.

Fort Loudoun (Pennsylvania)

One of several forts erected along Forbes Road, built in 1756, which ultimately helped facilitate communications and supply lines during Brigadier General John Forbes's western campaign in 1758. Fort Loudoun was situated at the head of the Conococheague Creek and was originally designed to protect settlers west of the Susquehanna River from native and French raids. The fort was named for John Campbell, Lord Loudoun, commander in chief of British forces at the beginning of the French and Indian War (1754–1763). In 1758, during that conflict, Forbes was assigned the task of taking Fort Duquesne. He had the choice of using the road built by Major General Edward Braddock during his failed attempt to capture Fort Duquesne in 1755, or building a new, more direct road across southern Pennsylvania. Forbes chose the latter course. Fort Loudoun was among the forts protecting this new route.

Fort Loudoun was a square structure constructed of logs and measuring some 127 feet on each side. Two of its corners had shooting platforms that extended out from the walls. The gate was on the north side and it is believed there was a sally port on the south side. The fort contained a well for water and several buildings.

Colonel Henry Bouquet used the fort for his expedition during Pontiac's Rebellion in 1763. The fort was closed in November 1765.

Fort Loudoun (Tennessee)

British military outpost built in 1756 in present-day eastern Tennessee, near the Cherokee town of Chota. Fort Loudoun was the fulfillment of a longtime British ambition to build a fort in the Tennessee River Valley to aid their Cherokee allies and provide protection from French and native incursions. Gov. James Glen of South Carolina had made construction of such a fort a priority of his policy toward Native Americans, and after years of negotiations, the Cherokees finally granted permission at the 1755 Saluda Conference for its construction.

Some 300 South Carolina provincial troops, led by Captain Raymond Demer, arrived in Tennessee in August 1756 to begin construction. William De Brahm designed the fort, but from the beginning Demer and De Brahm clashed over its location, design, and the allocation of manpower. De Brahm's elaborate earthworks ultimately proved too difficult to construct in the rocky mountain soil. Following De Brahm's departure in uncertain circumstances, Demer adopted a simple palisade design, and the fort was completed in the spring of 1757. Named for the Earl of Loudoun, the fort would last only four years, for the British garrison surrendered it to native attackers during the Cherokee War (1759–1761).

Fort Loudoun was more European in design than most North American forts. It was of diamond shape, with bastions in each corner. Fort Loudoun quartered 120 South Carolina militiamen and approximately 90 British regulars. Demer had charge of the garrison until August 1757, at which time his brother Paul assumed command.

That the Cherokees would attack a fort they themselves had requested only six years earlier said much about their apprehensions concerning new neighbors. Many natives had long resisted such a project, knowing from long experience that British forts usually preceded British settlers. However, pro-English chiefs such as Attakullakulla viewed the outpost as a renewal and strengthening of Anglo-Cherokee friendship and a way of checking French influence. Others, such as Old Hop, the chief of Chota, hoped to have Virginia, French, and Carolina neighbors to offset each other and thereby maintain Cherokee independence. For these men, the fort also served a practical purpose of offering Overhill Cherokees a military refuge from attacks from either the Iroquois or the Creeks, both enduring enemies of the Cherokees.

As events unfolded during the French and Indian War (1754–1763), and the Cherokees suffered indignity and violence at

the hands of their alleged British allies, anxieties concerning Fort Loudoun grew. When the Cherokee War began in the fall of 1759, the fort's days were clearly numbered. A long and difficult journey separated Fort Loudoun from Carolina resupply and it fell easy victim to a Cherokee siege that began on March 20, 1760. Out of provisions, Demer surrendered Fort Loudoun on August 8, 1760, and the natives took possession the next day. The Cherokees had agreed to allow the British to return to Carolina or Virginia unmolested, but on August 10 the fort garrison was attacked as it broke camp. Native warriors killed the officers and took the rest of the garrison prisoner, probably in revenge for native hostages murdered in 1759 at Fort Prince George near the Cherokee town of Keowee in western South Carolina. By 1761, the Native Americans had razed the fort.

Fort Loudoun (Virginia)

British fort constructed during the winter of 1756–1757, located in Virginia's northern Shenandoah Valley at Winchester in Frederick County. Fort Loudoun (named for the commander in chief of British forces in America, Lieutenant General John Campbell, Lord Loudoun) was protected by a wooden palisade. It was ordered built by Colonel George Washington, who had assumed command of British forces after Major General Edward Braddock's defeat and death in 1755. The actual construction was supervised by John Patterson, who worked under Washington's oversight. Fort Loudoun was part of a network of British forts that stretched from the Potomac River down to the Carolinas. Its principal mission was to provide protection to the Virginia frontier and the settlements to the east during the French and Indian War (1754–1763).

Washington was intimately involved in the design and construction of Fort Loudoun (his preliminary drawings of the post are extant and may be examined at the Library of Congress). Washington's diagrams depict an installation of a modified star design, with four square bastions. It was protected largely by cannon mounted on each spur of the fort. Its walls were composed of earth and were double-palisaded. Fort Loudoun contained a guard house, a kitchen, a large storage facility, and barracks capable of accommodating more than 400 men.

Fort Loudoun acted as a supply base for smaller forts in the area. Washington used it as his headquarters throughout his tenure as

commander of Virginia's forces. Today, all that remains of the fort is the 40-foot-deep well dug by Christian Heintz in 1757. The well adjoins a house built in the 1820s. Both are owned by the French and Indian War Foundation.

Fort Louis (Alabama)

French fort built in 1702 on high ground overlooking the Mobile River, approximately 25 miles north of Mobile Bay. The first permanent French settlement on the northern Gulf Coast, Fort Louis and vicinity was Louisiana's capital and military center to defend territory from the English and Spanish and guard coastal waterways and Mississippi River Valley trade routes. Officially called Fort Louis de la Louisiana, the fortification protected French interests and supplied troops and Native American allies.

When Fort Maurepas (Mississippi) failed to meet French expectations, Pierre Le Moyne d'Iberville sought to establish a more enduring colony to assert France's control in Louisiana. Toward that end, he ordered construction of a fort and community north of Mobile Bay, an area he thought more suitable than Biloxi Bay. D'Iberville considered the Mobile area to be of strategic importance because the bay and rivers were navigable for larger ships, and French explorers had already charted the land and interacted with the natives.

The French court instructed d'Iberville to arrange the transfer of men and supplies from Biloxi to Mobile; the court also expected him to create and colonize a capital there. D'Iberville assigned that task to his brother, Jean-Baptiste Le Moyne de Bienville. In January 1702, Bienville, his brother Joseph Le Moyne de Sérigny, and explorer Charles Levasseur traveled up the Mobile River. The men discussed their plans with natives who told them about a bluff on the western riverbank. Bienville sent his brother information and drawings of the proposed site. D'Iberville approved the location, which the French called Twenty-seven Mile Bluff, indicating its rough distance from the coast, and directed Bienville to begin building a fort there.

Carpenters, masons, and laborers, mostly from France and Canada, constructed the facility. Fort Louis had curtain-style walls and bastions at each junction. It featured squared-off pine timbers arranged horizontally with dovetailed corners. The interior of the fort, which was about 120 feet square, contained a storehouse, a

guardhouse, officers' quarters, and a church. The fort was protected by palisades that went all the way to the riverbank, where barracks and a powder magazine were located. D'Iberville arrived in March 1702 to view the facilities, at which time he christened the post Fort Louis to honor King Louis XIV. After a March 27 peace ceremony with the Choctaws and the Chickasaws, d'Iberville returned to France. Bienville served as the fort's commander.

Friendly tribes used the fort's grounds for camping and conferences. Some natives provided fort residents with food and helped defend against unfriendly tribes. Fort Louis also provided supplies for raids against hostile natives. No significant enemy assaults damaged the fort. As it turned out, weather was its worst enemy. Fort Louis began deteriorating rapidly in the hot, humid climate. Workers routinely replaced rotting logs, and during these repairs, laborers reinforced and expanded the fort.

In early 1711, floods inundated Fort Louis. Water from saturated creeks and rivers filled buildings and homes, forcing the fort community to evacuate. Many people had previously complained that Fort Louis was too far from the colony's port on Dauphin Island outside Mobile Bay. And they sought brick and mortar buildings rather than completely wooden structures. The swampy environment of Fort Louis also hosted mosquitoes that carried deadly yellow fever.

Colonial officials subsequently chose a better fort site near the bay, and several hundred colonists dismantled buildings and floated materials and belongings south to the new Fort Louis. The new site was located where present-day Mobile is now situated, on Mobile Bay. The French frequently repaired, reinforcing with brick, and enlarged the new Fort Louis. By 1724, officials had begun calling it Fort Condé, to honor General Condé whose relatives resided in Mobile.

Fort Loyal (Maine)

English post built in 1676, situated at Falmouth, Maine (then part of Massachusetts) on Casco Bay. Its precise location was at the foot of present-day India Street in Portland, Maine. Fort Loyal was originally a palisaded log structure intended to serve as a safe haven for Falmouth settlers in case of native attacks. In 1690, during King William's War (1689–1697), the English augmented and rebuilt the fort to include four blockhouses and a battery of eight light guns.

These additional fortifications proved quite inadequate in the face of a major attack by French soldiers and a contingent of allied

Abenakis. In May 1690, a 500-man French-led force left Quebec to launch attacks against English settlements in Maine. The force arrived at Falmouth on May 16 and launched an attack against Fort Loyal, laying siege to it for five days. When the French attacked a settler outside the fort's walls, the garrison raised 30 volunteers who left the fort to do battle. They were quickly dispensed with, and only 4 badly wounded men managed to regain the fort. Captain Sylvanus Davis, Fort Loyal's commander, negotiated a surrender after most of the fort's inhabitants had died or were wounded. Although the fort's remaining inhabitants were guaranteed safe passage to neighboring settlements, Abenakis attacked and killed most of them. Davis and 4 of his men were carried back to Quebec.

The attackers leveled Fort Loyal and the settlement it was designed to protect. In 1742, a new fort was built on the ruins of Fort Loyal. It was named Falmouth Fort.

Fort Lyttelton (Pennsylvania)

Pennsylvania garrison built in 1755 and located along the upper Aughwick Creek, northeast of modern-day Fort Littelton in Fulton County, Pennsylvania. Named by Gov. Robert Hunter Morris for the English chancellor of the Exchequer, George Lyttelton, and constructed by George Croghan in December 1755, Fort Lyttelton contained houses and four bastions in a stockade measuring 100 feet by 100 feet. It served as a station on the Forbes Road, part of a forward location a considerable distance away from other posts. Fort Lyttelton was one of a string of fortifications called for by Governor Morris to defend Cumberland County (now the counties of Cumberland, Franklin, Fulton, Huntingdon, and Juniata). With the outbreak of the French and Indian War (1754–1763), threats from the French and their Native American allies had risen dramatically.

Once native assaults resulted in the loss of private stations and Fort Granville, troops from Fort Lyttelton and its sister posts were organized into two ranger companies by March 1756 and assigned to scout a secondary defensive position. In September 1756, the defensive line was reorganized again. With the exception of Fort Lyttelton, the initial fortifications of the Cumberland Country defensive line were evacuated. Reassigned troops were sent to the post and, after Brigadier General John Forbes's campaign in 1758 culminating in Britain's capture of France's Fort Duquesne, Fort Lyttelton became a liaison in a military chain of communication to Fort Pitt (formerly Fort Duquesne).

Fort Lyttelton housed provincial troops until Forbes converted it into a British installation in June 1758. Garrisoned by regulars or provincials unit 1760, it remained the only provincial post west of the Susquehanna River to remain active following the fall of Fort Granville and the Battle of Kittanning. By 1763, it stationed local volunteers.

Fort Lyttelton (South Carolina)

British fort constructed between 1758 and 1763, located roughly one-and-a-half miles south of Beaufort, South Carolina, on Spanish Point. Beaufort, situated on Port Royal Island, lay exposed to potential attack from Native Americans, the Spanish, and the French. Because it was on an island and very near Port Royal Sound, its defenses were difficult to secure completely.

In 1731, local settlers constructed Fort Frederick, which was just outside Beaufort proper (now the site of the U.S. Naval Hospital in modern-day Port Royal). The fort's location, however, was a poor one and left the town exposed to assault from the west. By the late 1750s, Fort Frederick had fallen into decrepitude. In response, the South Carolina Assembly appropriated funds to build a new fortification. Gov. William Henry Lyttelton also requested that London reinforce the new post with a 50- or 60-gun ship to be located in Port Royal.

Construction of Fort Lyttelton began in 1758 and was finished in 1763. Although the redoubt did not have a clear view of Port Royal Sound, its location assured that any ship trying to make its way to Beaufort would be spotted. Fort Lyttelton's longest section, which faced the Port Royal River, was 375 feet in length. The fort's other two sides were equal in length and were protected by a moat. The outer walls were composed of tabby, a mixture of lime, water, and oyster shells that made for surprisingly strong structures. Fort Lyttelton had two demibastions that fronted the river and a full bastion facing the land side, which had a gate.

The post could garrison up to 100 enlisted men, along with several officers. At the height of its readiness, it mounted at least 15 cannon. During the American Revolutionary War, Fort Lyttelton's commander, Captain William Harden, assembled a voluntary artillery unit there called the "Old B. V. A." (Beaufort Volunteer Artillery). This outfit went on to serve in every conflict in which the United States fought. Now the 1055th Transportation Company, it is the United States' fifth oldest military company.

Fort Machault (Pennsylvania)

French fort built about 1753 on the western bank of the Allegheny River near the mouth of French Creek and close to the Delaware village of Venango (modern-day Franklin, Pennsylvania). In 1753, Major George Washington delivered a letter from Virginia's Lt. Gov. Robert Dinwiddie to the French at Fort Le Boeuf. Dinwiddie's message demanded that the French abandon the Ohio Country, including their forts in the region. While making their way to Fort Le Boeuf, Washington's party stopped at Fort Machault and stayed for three days.

Fort Machault was designed to secure a supply facility at Venango, hence its location at the crossroads of two French supply trails leading to the Ohio Country. The fort was a wooden, square-shaped stockade with bastions in each corner. Buildings formed two sides of the structure. It was not particularly well fortified and usually mounted only a single swivel gun. The garrison could accommodate as many as 400 men, although there were usually only 40 or so men there at any one time.

In 1759, during the French and Indian War (1754–1763), Captain François-Marie Le Marchand de Lignery collected French troops at Fort Machault in hopes of launching an attack to retake Fort Duquesne from the British. By July 12, he had collected more than 700 soldiers and 400 Native Americans and was set to launch his attack against Fort Duquesne. However, before he could set off, he received word that Fort Niagara was under siege and in need of assistance. Lignery then led his troops to Fort Niagara, only to be defeated at the Battle of La Belle Famille on July 24. This led to the French loss of Fort Niagara. Once it had been taken, the French could not supply Fort Machault and were forced to abandon it in August 1759, burning it to the ground as they left.

After the French and Indian War, the British took possession of Fort Machault's site and renamed it Fort Venango. During Pontiac's Rebellion in 1763, a band of Seneca warriors attacked Fort Venango in June 1763, wiping out the entire garrison.

Fort Manaskin (Virginia)

English fort erected sometime after 1660, also known as Fort Matuxon, and situated along the Pamunkey River not far from the York River in New Kent County, Virginia. The garrison was intended to bolster Virginia's defenses against Native American attacks. The York River is formed by the confluence of the Pamunkey River and Mattaponi River, an area that was home to the Pamunkey tribe. The Pamunkeys were the most powerful of the tribes that formed the Powhatan Confederacy.

Pamunkey chief Opechancanough, brother of Chief Powhatan and uncle of Pocahontas, had succeeded Powhatan as the active leader of the confederacy. He despised the English and had launched the Second Anglo-Powhatan War beginning in 1622, in which 350 settlers were massacred. In 1644, Opechancanough, now old and feeble, urged one last great surprise attack to annihilate the English. And so on April 18, 1644, the Powhatans attacked the area's settlers once more. More than 500 settlers living on the frontier perished.

Opechancanough was tracked down, captured by the English, and taken to Jamestown, where he was treated tolerably well by Gov. Sir William Berkeley. However, Opechancanough was mortally wounded when shot in the back by an outraged colonist.

In October 1646, Opechancanough's successor, Chief Necotowance, signed a treaty by which the natives agreed to surrender lands in the Tidewater region and to withdraw behind the falls of the James River and Pamunkey River. After the English Restoration in 1660, Berkeley initiated actions to strengthen the colony's defenses. This led to the construction of Fort Manaskin in New Kent County on the Pamunkey River to help defend the frontier against any new native raids.

Nothing is known of the fort's physical characteristics or how it was employed, although Native American allies may have formed part of its garrison.

Fort Mary (Maine)

One in a series of redoubts located in Biddeford Pool, York County, Maine (then Massachusetts), built in 1710 on a bluff overlooking Winter Harbor. Fort Mary was not the first defensive installation in the community. Major William Phillips erected a modest garrison just below the lower falls of the Saco River sometime in the 1660s.

In 1675, however, local natives destroyed the post as part of a longstanding feud with the English settlers. The English then relocated to Winter Harbor. But it was not until 1693 that another fort was built near the falls. In 1703, natives captured and briefly held the stone fort, but the settlers soon recaptured it. In 1707, the garrison moved from this site in part because the British were constructing a new fort at the entrance to Biddeford Pool.

The new fort was completed in 1708 and named Fort John Hill, after its commander. That same year, Native Americans attacked Fort Hill. The English expanded Fort Hill in 1710 and renamed it Fort Mary, although the point on which it sat was called Fort Hill as late as the last half of the 19th century. Fort Mary and the other garrisons were relatively effective in deterring native attacks. Indeed, there were no recorded incidents of native attacks after 1748. It is not known when Fort Mary was degarrisoned, although its remnants were still in existence as late as 1886.

Fort Massachusetts (Massachusetts)

English fort built by the Massachusetts Militia in 1744 during King George's War (1744–1748). The fort was located along the Housatonic River, 25 miles east of Albany, New York, near present-day North Adams, Massachusetts. Fort Massachusetts was designed

to protect settlers and traders along the border frontier against regular native raids and possible French Canadian incursions. Of rustic construction, the fort comprised a stockade 60 feet square, a garrison house on a stone foundation surrounded by palisades, redoubts, and outworks. With the possible exception of Fort Darby and Hatfield Fort, it was the most important outpost in the colony.

In the summer of 1746, Fort Massachusetts came under attack by enemy troops consisting of French regulars, Canadian militia, and their Abenaki allies. This assault was in retaliation for the Massachusetts expedition against Crown Point, New York. Heavily outnumbered, the defenders—commanded by Sergeant John Hawks of Deerfield—held out for 28 days before they were forced to surrender. The garrison was taken to Canada, under guarantee of safety, where they were exchanged for French prisoners in British hands. The French subsequently demolished the fort. However, it was rebuilt in the winter of 1746–1747 with added improvements and placed under the command of Captain Ephraim Williams. It remained occupied during the interwar period and for part of the French and Indian War (1754–1763) but saw no more military action. Gradually falling into disrepair, the fortification was finally demolished in 1759.

In 1933, a reconstructed fort was erected on the former site, which operated for several years as a tourist attraction. It was later closed because of vandalism and insufficient operating funds. Today the space once occupied by Fort Massachusetts is the parking lot of a supermarket.

Fort Massiac (Illinois)

French fortification constructed in 1757 on the lower Ohio River, about 40 miles above its confluence with the Mississippi River. The French erected Fort Massiac to monitor trade and defend against British and enemy Native American attacks. Strategically located near the Tennessee River and Mississippi River, Fort Massiac helped French troops guard the Louisiana colony. Built during the French and Indian War (1754–1763), Fort Massiac protected supply convoys on the nearby rivers, as western-grown grains were crucial to feeding troops at eastern forts because Canadian supplies were often inadequate.

In 1745, the Louisiana government had asked engineer Bernard Deverges to plan a lower Ohio River fort but did not support his suggestions. By spring 1757, however, French officials, worried about possible invasions into Louisiana via the Ohio River and Tennessee River, instructed Captain Charles Philippe Aubry to examine a fort site that Deverges had recommended.

Aubry traveled from Fort de Chartres on the Mississippi to a steep bluff topped with swampy land and gullies. Construction on the fort began on Ascension Day, and officials initially called the wooden structure Fort Ascension when it was finished in June 1757. Because the fort had been hastily built, Deverges criticized it as being too small and weak. That autumn, however, the fort's soldiers successfully repelled a major Cherokee assault. Other smaller raids also harassed the fort's occupants but caused only minimal damage.

French losses in the Great Lakes and rumors of possible Native American raids resulted in soldiers reinforcing the fort with terraced ditches in 1759. Officials then renamed the works Fort Massiac to honor marine minister Claude Louis d'Espinchal, Marquis de Massiac (Massac is the anglicized version of Massiac).

The Treaty of Paris (1763) having transferred the region to the British, the French abandoned Fort Massac. As the British were uninterested in maintaining the installation, it was left to the elements and the Chickasaws, who razed it sometime after 1763.

Fort Matanzas (Florida)

Small Spanish garrison built in 1569 at the mouth of the Matanzas River, approximately 15 miles south of St. Augustine. In 1564, the French built Fort Caroline at the mouth of the St. Johns River in northern Florida for the purposes of raiding Spanish galleons and providing a colony for their troublesome religious Huguenot minority. The Spanish promptly dispatched Pedro Menéndez de Avilés to Florida to eradicate the French encroachment. By the time Menéndez discovered the location of Fort Caroline in 1565, its force of more than 600 Huguenot soldiers was too strong for him to attack. Retreating to a favorable harbor 40 miles to the south, Menéndez founded St. Augustine, where he began plotting his assault on the French. Meanwhile, the French planned to move against Menéndez's position while his fledgling colony was still in its infancy. Thus, a French force of 500 men sailed toward St. Augustine, Thus, a French force of 500 men sailed toward St. Augustine, Thus, a French force of 500 men sailed toward St. Augustine, Thus, a French force of 500 men sailed toward St. Augustine, Thus, a French force of 500 men sailed toward St. Augustine, Thus, a French force of 500 men sailed toward St. Augustine, Thus, a French force of 500 men sailed toward St. Augustine, Thus, a French force of 500 men sailed toward St. Augustine, Thus, a French force of 500 men sailed toward St.

tine, but the fleet was blown off course by a hurricane. Only about half the men were able to struggle ashore, 60 miles to the south of St. Augustine.

Seizing the opportunity, Menéndez launched a successful assault on the now nearly empty Fort Caroline. He then swung south to catch any survivors from the ships. Menéndez intercepted the exhausted and starving French soldiers as they struggled up the shoreline of the Matanzas inlet. The French surrendered without a fight, but Menéndez refused to grant leniency on the grounds that they were heretics. He ordered the French prisoners divided into small groups, taken behind the dunes, and executed. At least 245 men were put to death, giving the stretch of beach its name "Matanzas," Spanish for "massacres." Among those killed was French Huguenot and leader of the doomed expedition Jean Ribault.

The Spanish proceeded to build a tiny fort on the isolated barrier island at the base of the Matanzas inlet to protect their settlement at St. Augustine, which lay 15 miles to the north. The first wooden watchtower of Fort Matanzas was built in 1569. Its sole function was to serve as a lookout post for enemy ships that might be traveling up the coast to attack St. Augustine from its single, vulnerable point. The site was expanded to include a small garrison and blockhouse. In the 1740s, a stone fort was built at the site and still stands today.

Fort Matuxon (Virginia)

See Fort Manaskin (Virginia)

Fort Maurepas (Mississippi)

French fort first built in 1699 on Biloxi Bay near present-day Ocean Springs, Mississippi. Following French explorer René-Robert Cavelier, Sieur de La Salle's, journey down the Mississippi River in 1682, France quickly moved to secure the Gulf Coast and the mouth of the Mississippi. In 1698, French explorer Pierre Le Moyne d'Iberville traveled along the coast and scouted for important waterways in the region. In early 1699, he established a small fort along the modern-day Mississippi Gulf Coast, west of the mouth of the Pascagoula River.

D'Iberville named the post Fort Maurepas, after a French colonial minister. The site was to be used as a temporary base of operations for French exploration of the Mississippi River. The location of the fort was not ideal for a permanent settlement, however. The bay was fairly shallow and the land marshy and often covered in fog. Yet, it was suitable for its immediate purpose, which was the garrisoning of French soldiers and the regulation of access to the Mississippi River.

As the French soldiers, sailors, and workers cut timber and hauled supplies from their ships to build the fort, local natives watched with curiosity from a distance. Contact between the Europeans and natives began cautiously. But within months that contact evolved into a peaceful relationship. The French garrison hosted chiefs from nearby villages, including the Pascagoulas, the Biloxis, and the Capinas, in a ceremony lasting three days. These relations showed promise for the survival of the fort and additional French settlement along the coast.

By late April 1699, general construction had been completed. The fort was built according to military fortifications designed by Sebastian de Vauban. The defenses included four bastions, a double palisade, and parapets. Two of the bastions mounted cannon. Within the defensive works stood lodging for soldiers and laborers, a drill ground, a powder magazine, and a warehouse. D'Iberville returned to France shortly after the initial construction was completed, leaving a garrison there of nearly 100 men and officers. These soldiers continued to improve the structure and facilities while familiarizing themselves more thoroughly with the local waterways.

D'Iberville returned to the region in early 1700. Concerned by English encroachment into the Mississippi Valley, he ordered Fort Maurepas reinforced. By the end of 1700, the bastions had been strengthened by ship carpenters. Now, 12 swivel guns and 12 cannon protected the fort. Further, the French built a small outpost on the banks of the Mississippi, about 20 miles from its mouth, to aid Fort Maurepas in controlling access to the river. But this new fort, Fort de la Boulaye (or Fort Mississippi), soon proved to be virtually worthless. Within months, disease and poor access to fresh water weakened the small garrison. Fort Maurepas remained, for the time being, the key French base for the Gulf Coast and the Mississippi River.

By late 1701, disease had effectively weakened Fort Maurepas' garrison. With an ailing garrison there and an interest in establishing a more permanent settlement, d'Iberville led an effort to move French men and material to Mobile. He chose that site for its attractive land and access to friendly native communities. By 1702, Fort Maurepas was abandoned. It was briefly reactivated in 1719 when the French tried to establish a larger settlement in Biloxi.

Fort Miami (Michigan)

French post built in 1679 under the order of René-Robert Cavelier, Sieur de La Salle, located at the mouth of the St. Joseph River. The site was strategically located at the junction where the St. Mary's River and St. Joseph River join to form the Maumee River, which then flows into Lake Erie. In September 1679, a small fort was built on the site, the construction of which fell to Henri de Tonti. The initial fortification was little more than a palisade, roughly 40 by 80 feet, which faced the river on two sides. Once completed, the garrison was named for the Miami tribe who inhabited the area at the time.

The first fort was destroyed by a group of French deserters from La Salle's party in the winter of 1680. The site remained abandoned until 1700, when a Jesuit mission and a second fort were erected on the same site. The fort remained a French bastion until the end of the French and Indian War (1754–1763), when it passed under British control. At that point, the British appointed Colonel John Butler to take command of the post. The fort remained in British hands until it fell to a raiding party during Pontiac's Rebellion in 1763. At the end of the uprising, the fort returned to British control. A number of early historians of the Old Northwest, Francis Parkman among them, confused Fort Miami with Fort St. Joseph, which also lies along the St. Joseph River.

Fort Michilimackinac (Michigan)

French fort built in 1715 and situated on the south side of the Straits of Mackinac, which connect Lakes Huron and Michigan. Fort Michilimackinac was an important military and fur-trading post throughout the colonial period. With the expansion of the fur trade west in the early 18th century, New France established a series of forts and fur-trading outposts along the Great Lakes. Detroit (Fort Pontchartrain) was founded in 1701.

In the spring and summer of 1715, Constant Le Marchard de Lignery established Fort Michilimackinac at the tip of Michigan's Lower Peninsula. The post at the Straits of Mackinac was perfectly positioned to control access routes west via Lake Michigan. It was also a traditional gathering place for Native Americans who wished to trade furs.

The first fort was a small, rectangular wooden palisade with blockhouses holding cannon in each corner. This design evolved many times over the history of the post until it was a sizable stronghold boasting five walls and six armed blockhouses by the time it was abandoned in the 1780s. The military garrison was housed inside, as were numerous French traders and their families. Fort Michilimackinac also contained a Roman Catholic chapel, a blacksmith's shop, and numerous gardens. A thriving métis settlement grew up outside the fort's walls.

Fort Michilimackinac was most active in the summer, as natives came from the far west to trade beaver skins to the French traders and French *voyageurs* and *coureurs de bois* cycled through the fort. French missionaries also traversed the area, usually Jesuits. The winter was a far different scene, as the lakes froze to boat traffic and snow piled up high along the fort's walls. Travel was very difficult, if not treacherous.

In addition to its service as a premier trading post, the military forces at Fort Michilimackinac undertook many important campaigns. The fort served as a staging area for French attacks on unfriendly natives and for French and native attacks on the English, notably during the Fox War and Braddock's 1755 campaign.

With the end of the French and Indian War (1754–1763), the British took control of the French forts on the Great Lakes. French officials relinquished control of Fort Michilimackinac on October 1, 1761. Almost as soon as the British established themselves there, tensions occurred between the British and local natives over trading practices. During Pontiac's Rebellion (1763), in June 1763, soldiers there were stunned when a game of lacrosse turned into a diversion for disgruntled local natives to attack and take the post, killing a number of British soldiers in the process. With the end of Pontiac's Rebellion, the British retook Fort Michilimackinac in 1764 and tried to cultivate better relations with the Native Americans of the region.

During the 1760s, the British maintained Fort Michilimackinac as a military and trading post. The traditional way of fort life returned, with busy summers and long, monotonous winters. With the beginning of the American Revolutionary War in 1775, Fort Michilimackinac renewed its purpose as a staging area, this time for joint native-British attacks on Patriot forces. The fort's commander, Patrick Sinclair, was fearful that the Americans might attack the old, wooden fort and that it would not withstand an onslaught. In consequence, the British government bought land on Mackinac Island in the middle of the straits. The garrison and town inhabitants then disassembled the mainland fort and village, and moved it across the water to its new home via boats in the summer and across the ice during the winter. The new, stronger stone fort was situated on a high bluff. The British occupied the new fort, named Fort Mackinac, in July 1782.

Fort Mill (South Carolina)

British fort constructed in 1756 within present-day Fort Mill, York County, South Carolina. Construction of Fort Mill was begun under the direction of Lieutenant Hugh Waddell on the order of Hugh Dobbs, royal governor of North Carolina. The year 1756 was perhaps the height of the French and Indian War (1754–1763). Although a large number of Native Americans living beyond the frontier fought for the French, the Catawbas and the Cherokees remained loyal to the English. To reward this loyalty, the British promised to build a fort for the Catawbas. Its purpose was to protect Catawba women and children while the Catawba men were off fighting the war.

The palisaded structure was located about one mile south of the village of Fort Mill. It was never completed, probably because it had been promised to the Indians and was soon forgotten. In the 1870s, A. A. White of Fort Mill produced a sketch that provides the bulk of the known information on the fortress. It had two entrances and a 70-foot-deep well that was dug in the center. The post was 200 feet square. White recalled that the original plan called for cannon to be mounted on each of the four corners, although these were likely never installed.

It may be assumed that the frugal citizens of nearby Fort Mill, rather than see the fort's materials rot, used what they could salvage and incorporated the building material into houses nearby. In any case, the fort vanished without a trace. Today the site is delineated by a marker that indicates the fort's location.

See Fort de la Boulaye (Louisiana)

Fort Moore (South Carolina)

English post built in 1716 and situated on a 200-foot-high bluff on Beech Island, located on the east bank of the Savannah River near present-day Augusta, Georgia. During the Yamasee War (1715–1717), the government of South Carolina ordered the construction of several forts to provide protection to settlers on the frontier. Among them was Fort Moore, near the headwaters of the Savannah River. The post commanded the area's trading paths and protected northwestern South Carolina from native attacks.

Beech Island had been the location of a thriving Shawnee trading village known as Savannah Town, which would later be settled as New Windsor, several miles south of present-day Augusta, Georgia. Savannah Town was a major rendezvous point where inland native trails met water routes. It also served as a shipping point for hides from the backcountry to Savannah, Charles Town (present-day Charleston), and, eventually, Europe.

Militia captain Gerald Monger supervised construction of Fort Moore, which was named in honor of former South Carolina's Gov. James Moore. The fort was about 150 feet square and was surrounded by a planked wall almost five feet high. Inside the fort were officers' quarters, barracks for a hundred men, a guardhouse, a powder magazine, and other buildings. The structures were very crudely built and required constant maintenance by the garrison because of the humid conditions and vulnerability of wood to insects such as termites. Twice each year the commander of Fort Moore was required to submit copies of the muster roll for pay purposes to the colonial government. The soldiers were encouraged to plant and raise their own provisions in the area near the fort and received pay for contributing to the garrison's subsistence. The remoteness of the site from other colonial settlements is best illustrated by the fact that on occasion people convicted of crimes in Charles Town were exiled to Fort Moore for up to one year duration.

As Augusta developed into a new center for Native American trade, many who lived at New Windsor and Fort Moore relocated to the Georgia side of the river. In 1743, the commanding officer recorded only four residents near Fort Moore, and he questioned the need for the outpost. However, in 1748 South Carolina leaders, worried about another war with the natives, ordered that Fort Moore be completely rebuilt because it had fallen into disrepair. The walls of the new fort were 10 to 15 feet high with a walkway platform attached to the inside wall. Cannon were mounted on four corner bastions and were covered by a shedlike roof to protect the gunners. Normally, the Fort Moore garrison consisted of provincial troops and varied between 14 and 30 men depending on the security situation. They generally had a static mission to guard the fort and man the guns and did not perform ranger duties or patrol the countryside.

Until the late 1740s, most soldiers at the fort were provincial militia. After that time, however, independent companies of regular forces were often garrisoned there. In February 1760, Fort Moore

provided protection during Cherokee raids on white settlers in the Augusta area. During that struggle, Captain Ulrich Tobler was killed and scalped as he tried to lead militia out of Fort Moore.

In 1766, because of settlement farther into the backcountry, the South Carolina Assembly decided to establish a new outpost on the Savannah River about 40 miles north of Fort Moore. Once Fort Charlotte was completed there, Fort Moore was abandoned and its garrison of one officer and 25 soldiers of the 60th Regiment were transferred to the new post. After more than 50 years of service, Fort Moore eventually fell into ruin.

Fort Mosé (Florida)

Spanish fort constructed in the mid-1730s as Gracia Real de Santa Teresa de Mosé and situated two miles north of Spanish-held St. Augustine, Florida. Fort Mosé housed a free African American militia. Although it provided little protection for the residents in St. Augustine, the fort's population of freedmen and Spain's promise of liberty to slaves who escaped from the British colonies created a powerful symbol of freedom.

Fort Mosé's location provided the garrison inside St. Augustine's walls with an early warning system. If an armed force moved against St. Augustine from the north, the advance on the city would first encounter the nearby Fort Mosé militia. Built on the westernmost bend of a small tidal creek, the fort had an earthwork wall and wooden palisade for protection. A three-foot-deep dry moat was dug in front of the walls and was filled with Spanish yucca, also called bayonet cactus for its razor-sharp blades.

Inside the fort, the former slaves enjoyed many privileges denied enslaved African Americans in the British colonies. In exchange for their freedom, the fugitive slaves converted to Catholicism. To facilitate this change, the government at St. Augustine assigned a Franciscan priest to live inside the fort. Fort Mosé's inhabitants controlled the small settlement themselves, save religious observances. Service in the militia was compulsory, and the population chose its own leaders. But Fort Mosé's greatest power came from what the garrison and its residents symbolized.

The use of Fort Mosé as a defensive outpost reflected Florida's fears of British aggression. If arming former slaves helped destabilize South Carolina's plantations, St. Augustine officials believed its unusual policy could help Spain regain lost territory in the southeastern borderlands. Following the slave revolt at Stono, South Carolina,

in 1739, Spanish officials believed Fort Mosé might achieve Florida's lofty goals. However, a heavy British invasion in 1740 destroyed Fort Mosé and rendered Spanish policy ineffective.

Fort Nassau (New Jersey)

Dutch-built post located on the eastern bank of the Delaware River, near present-day Gloucester, New Jersey, across from Philadelphia. Captain Cornelis May of the Dutch West India Company founded Fort Nassau as a small trading post in 1624, one of several Dutch riverside outposts he established during this time. May led a colonizing expedition from the Netherlands to America that brought about 30 families of settlers. He set most of them ashore at Fort Orange (present-day Albany, New York) on the Hudson River. He left 12 men and 4 women to establish Fort Nassau, which was initially a wooden palisade with five or so small cannon.

Within two years, the Dutch decided to concentrate settlement at New Amsterdam, due in part to concern about Native American attacks. The settlers abandoned the outpost at Fort Nassau in 1626. A single trading vessel anchored near the empty fort served to represent Dutch trading interests.

By the summer of 1633, however, New Netherland faced challenges from neighboring English colonies. The Dutch then reoccupied Fort Nassau to assert their claim to the Delaware Valley in the face of English settlement in nearby Maryland. Arent Corsen led a group of traders who built a house on the site. Soon thereafter a blockhouse was added to the fort. However, the fort frequently lay vacant. Dutch West India Company traders typically occupied the fort only during the summer fur-trading season, and only a handful of settlers lived around the post.

In 1635, about 15 Englishmen from Virginia occupied the vacant fort, but New Netherland authorities soon received word of the incursion and captured them. In the spring of 1636 a 25-man New Netherland garrison arrived under the command of Jan Jansen and Peter May.

When the Swedish established their colony in 1638, the Fort Nassau garrison began challenging New Sweden shipping on the Delaware River. In 1645, Andreas Hudde succeeded Jansen as commander of Fort Nassau. He and Gov. Johan Printz of New Sweden, each under orders to tolerate their neighbor, dined together on at least one occasion and maintained diplomatic relations. Nevertheless, the situation gradually deteriorated, and an exchange of

escalating provocations ensued. Petrus Stuyvesant, governor of New Netherland since 1647, encouraged Dutch ships to ply the Delaware. In response, Printz seized guns from a Dutch ship and purchased land near the fort. And in 1648 the fort fired on a passing Swedish vessel.

Stuyvesant grew dissatisfied with the Dutch position on the Delaware. Swedish settlement and the Delaware River itself cut off Fort Nassau from trade with the natives to the west. The Swedish presence downstream at Fort Christina denied the Dutch access to Delaware Bay and the ocean. Stuyvesant sought to rectify this situation in 1651 by sending a fleet of 11 ships up the river and leading 120 soldiers overland to meet it at Fort Nassau. From there, he proceeded to establish Fort Casimer on the west bank of the Delaware River seven miles downstream of Fort Christina. Thus he gained control of river access and a foothold on the west bank. Fort Nassau's garrison, stores, and guns were transferred to Fort Casimer, and the Dutch freeholders who had settled around Fort Nassau moved with them.

Fort Nassau (New York)

Fort erected by traders from the Dutch West India Company in 1614, named after a leading Dutch noble family. The fort stood on Castle Island just off the western bank of the Hudson River, just south of present-day Albany, New York. Fort Nassau was easily accessible to Dutch trading vessels and Native American canoes alike. The traders built a small palisaded fort about 58 feet square, with four bastions and surrounded by a moat. It was equipped with two cannon and 11 swivel guns. The redoubt may have been built atop the ruins of a French structure dating back to 1540.

The Dutch traders expected to compete with the French traders on the St. Lawrence River for the native fur trade. Fort Nassau's location made ice less of an obstacle to navigation than it was in New France. The traders' willingness to sell firearms to the Native Americans gave them yet another competitive advantage over the French. However, annual spring floods, which inundated the fort with four to five feet of water, forced the abandonment of the post in 1617 or 1618. The brief existence of this early garrison provided New Netherland a claim to the region predating that of New England. In 1624, traders employed by the Dutch West India Company

built a replacement trading post, called Fort Orange, on the west bank of the Hudson.

Fort Necessity (Pennsylvania), and Battle of

Event Date: July 3, 1754

Makeshift fort constructed by Lieutenant Colonel George Washington of the Virginia Militia at Great Meadows (near modern-day Uniontown, Pennsylvania) during May–June 1754, subsequently surrendered to the French in July 1754. Fort Necessity was the site of a subsequent battle of the French and Indian War (1754–1763) that pitted 500 British colonial militiamen against 600 French Canadians and 100 American Indian allies.

Following the skirmish at Jumonville's Glen in May 1754, Washington and his small detachment of 46 men regrouped with other units of the Virginia Militia and withdrew toward the colonial frontier. While they awaited reinforcements, the French prepared their own expedition from Fort Duquesne under Captain Louis Coulon de Villiers, who sought to avenge the death of his brother, Joseph Coulon de Villier de Jumonville, who had been killed at Jumonville's Glen.

As Washington collected his forces after the skirmish, he was anticipating a French attack. Using his limited skills as a 22-year-old surveyor, he selected low, open ground in a meadow and there built a small stockade fort, aptly named Fort Necessity. The palisades were about 50 feet in diameter, encircling a storehouse of about 14 feet square, and the whole was surrounded by a shallow ditch.

This position was apparently intended as a rallying point for reinforcements, though Washington claimed it could withstand attack from 500 men. As troops from Virginia and South Carolina slowly arrived in the first weeks of June, Washington planned another advance to Fort Duquesne.

Leaving an independent company behind, Washington set out with about 300 Virginians on June 16. Unlike the party at Jumon-ville's Glen, this larger force was also given the assignment of building a road to the west. This would enable more colonial troops to reinforce the area and make it easier to defend Fort Duquesne once it was taken from the French. This movement was a precursor to the 1755 and 1758 campaigns in which British forces under Major General Edward Braddock and Brigadier General John Forbes, respectively, undertook the same project.

By June 28, 1754, Washington's road stretched roughly 13 miles, past the frontier home of Virginia trader Christopher Gist toward

the Ohio Company blockhouse at Red Stone Creek. On that day, Washington learned that several hundred reinforcements had reached Fort Duquesne, and that some 900 to 1200 French and American Indians were approaching. A council of war recalled the scouts and work parties, and, though Washington initially considered a stand at the Gist house, he decided to retire to Fort Necessity. He would dig in there with his whole force of about 450 men.

Throughout Washington's expedition, he proved a poor logistician, and he paid for this during his retreat. As pack animals died of fatigue and starvation, the Virginians had to move their baggage by hand, and abandon what they could not carry. When they reached Fort Necessity on July 1, the troops were too exhausted for further retreat. Worse still, Washington's fort failed to inspire confidence either in his own men or in his native allies. It could accommodate only 60–70 men; the remainder had to sleep in the shallow trench beyond the walls.

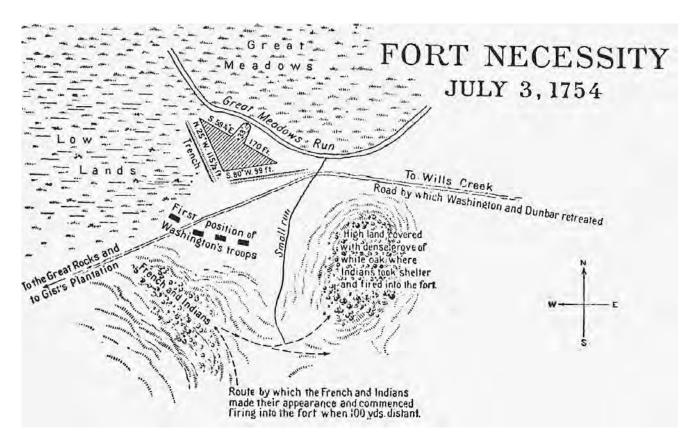

After two days' work, the ditch around Fort Necessity was only slightly deeper, and repairs on the storehouse and palisades were incomplete, at best. Washington's troops suffered a further misfortune on the night of July 2–3, when a heavy rain turned the trenches into a muddy quagmire, ruined the fort's rudimentary sanitation, and fouled the colonials' gunpowder. The following morning, a quarter of Washington's force was sick, and many of the firearms were too wet or dirty for effective use.

Around 11:00 a.m. on July 3, Villiers's force of 600 French Canadians and 100 American Indians arrived. They initially hit a small battle line and drove it back to the fort. There the colonials regrouped and brought one or two cannon to bear. Nonetheless, they were penned within their waterlogged trenches and incomplete palisades and were thus fully exposed to French fire from the surrounding woods and hills.

While the French and their native allies remained under cover of nearby trees, Washington's colonials were bogged down by continuing rain. With limited room for movement, increasingly ineffective firearms, and trenches filling with water, Washington's position gradually decayed during a 10-hour fight.

Over time, discipline crumbled. Eventually some men broke into the rum supply and became intoxicated while others around them were being killed and wounded. Washington was saved only by a relatively lenient French offer for terms of surrender. Though Washington probably could not have known the poor state of French supplies and morale, on July 3 he happily signed the instrument of surrender, part of which was an admission that he had ordered Jumonville's murder.

Washington and his force were allowed to withdraw, but news traveled back to France and England that Washington was responsible, in effect, for opening hostilities in North America. French diplomats suddenly proved less tractable in negotiations on the

Early 20th-century drawing depicting the surrender of Fort Necessity to the French in July 1754. (The Granger Collection)

North American frontier, and the British ministers began to consider how their forces might be bolstered. Ultimately, Washington's expeditions in 1754, and their failure at Fort Necessity, set the stage for large-scale British intervention in North America, starting with Braddock's expedition in 1755.

Fort New Casco (Maine)

English-built fort erected in 1700 near the mouth of the Presumpscot River in Maine (then part of Massachusetts). The construction of Fort New Casco led to the repopulation of Falmouth (later Portland), which had been devastated by a large party of French and allied natives in 1690. That raid had also destroyed Fort Loyal.

Colonel Wolfgang Romer designed Fort New Casco. It included a 70-foot-square palisade with bastions at its northwest and southeast corners. Raised sentry boxes commanded the other two corners. Within the palisade were the commandant's residence, a guardhouse, and a storehouse.

In June 1703, Gov. Joseph Dudley and a group of Abenaki leaders held a council at Fort New Casco to discuss the recent outbreak of Queen Anne's War (1702–1713). Both sides agreed to maintain peaceful relations. This agreement was soon violated, for on August 10, 1703, six Abenaki war parties assembled by the French and totaling some 500 warriors attacked Fort New Casco. The French and native force, led by Chief Moxus, succeeded in tricking the commander of the fort, Major John March, to leave the Fort New Casco, but he was able to return safely. The Abenakis then subjected the fort to a siege, which ended three days later when a Massachusetts ship arrived in the harbor.

In 1705, under the supervision of John Redknap, the English enlarged the fort. The remodeled structure was 250 feet long and 190 feet wide, and included privies, doctors' offices, and a blacksmith's shop. Fort New Casco never again came under attack, and it was dismantled in 1716.

Fort New Korsholm (Pennsylvania)

Swedish log fort located at the mouth of the Schuylkill River, built in 1647 and abandoned in 1653. Though little is known about the fort, it was probably on the south side of Province Island, near Philadelphia.

New Sweden was founded in 1638 after Peter Minuit purchased land from the Delawares (Lenni Lenape) and constructed Fort Christina along the Delaware River near modern Wilmington, Delaware. Under Gov. Johan Printz, New Sweden expanded into what is now Pennsylvania and New Jersey, constructing Fort New Gothenborg near modern Philadelphia and Fort Elfsborg near modern Salem, New Jersey. New Sweden's attempts to keep the English and Dutch out of the Delaware River region is what led to the construction of Fort New Korsholm in 1647 near the mouth of the Schuylkill River on the site of a Dutch trading post that had been abandoned in 1643.

New Sweden's expansion aroused strong opposition from the Dutch. In 1651 New Netherland's Gov. Petrus Stuyvesant went on the offensive, establishing Fort Casimer to the south of Fort Christina, effectively cutting New Sweden off from the sea. When Johan Rising arrived in New Sweden in 1654 to assume command of the colony he found that Fort Elfsborg had been abandoned and Fort New Korsholm had been destroyed by Native Americans. Believing that the Dutch had instigated the destruction of Fort New Korsholm, Rising attempted to remove the Dutch from the area by seizing Fort Casimer. Unable to defend against the unexpected attack, Fort Casimer surrendered on May 21, 1654, and was renamed Fort Trefaldighet (Trinity). Rising's victory proved to be short-lived. By September 1655 Stuyvesant had succeeded in conquering all of New Sweden. Ironically, New Netherland would fall a decade later to the English in 1664 during the Second Anglo-Dutch War.

Fort Niagara (New York)

Fort Niagara in New York guarded the portage route around Niagara Falls between Lake Ontario and Lake Erie. Control of the portage assured French dominance in the Great Lakes region and excluded English traders from the lucrative trade in beaver pelts. The first documented visit to the site of Fort Niagara occurred in 1669 by a party comprising priests and the explorer René-Robert Cavelier, Sieur de La Salle.

Traders established a post at the Niagara portage in 1676. Later forts built on the site included Fort Denonville in 1687 and the Magazin Royale erected by the trader Louis-Thomas Chabert de Joncaire in 1720. During the winter of 1725–1726 Joncaire supervised the construction of Fort Niagara as the log palisaded "House of Peace" with cannon hidden above the trading offices. To guard the trade routes between Iroquoia and Canada, the French improved the defenses of Fort Niagara by upgrading the simple log palisades to a regular fort built between 1750 and 1751.

With the outbreak of the French and Indian War (1754–1763), the capture of Fort Niagara became one of Britain's main strategic objectives. The capture of Fort Niagara was one element of British major general Edward Braddock's ill-fated 1755 campaign. A column of troops under Massachusetts governor William Shirley and Sir William Pepperrell Jr. proceeded as far as Oswego before the campaign season closed.

Niagara remained in French hands until 1759, when Brigadier General John Prideaux led a combined British and provincial task force to capture the fort, then held by a detachment under Captain Pierre Pouchot. In June 1759, Prideaux marched from Albany to the site of Fort Oswego, which Major General Louis-Joseph, Marquis de Montcalm's, French forces had razed in 1756.

In compliance with British major general Jeffery Amherst's orders, Prideaux detached soldiers to rebuild Fort Oswego, and he continued on with 2,000 soldiers and at least 600 Iroquois warriors led by Sir William Johnson. This column traveled by bateaux and whaleboat to the western end of Lake Ontario. On July 6 they landed four miles east of Fort Niagara and invested the fort that night. Pouchot surrendered the fort on 25 July after Johnson repulsed a relief column the previous day.

Following the war, the British made Niagara an important center of trade and diplomacy. Iroquois and provincial traders continued to transact business at the fort. Niagara served as an assembly area for Colonel John Bradstreet's forces to march in relief of Detroit during Pontiac's Rebellion in 1763. It also served as the location for a conference in 1764 when the Senecas repudiated their participation in that war and submitted to the Iroquois Confederacy's Covenant Chain.

With the expulsion of France from North America and the end of Pontiac's Rebellion, Fort Niagara's military significance diminished and its outer defenses fell into disrepair. During the American Revolutionary War, Fort Niagara served as a base for Loyalist partisans, especially those under John Butler, to raid into western New York and Pennsylvania and provided a route for displaced Loyalist refugees to resettle in Canada.

Fort Niagara (New York), Siege of

Start Date: July 6, 1759 End Date: July 25, 1759

British assault on and capture of Fort Niagara from the French during the French and Indian War (1754–1763). In July 1759, following an 18-day siege, British forces secured control of the isthmus between Lake Ontario and Lake Erie and isolated French forces in the Ohio Valley from their Canadian supply lines.

In 1759, the British planned multiple offensives against the French, including taking Fort Niagara. Anglo-American forces under Brigadier General John Prideaux were joined along the way at Fort Oswego by Iroquois warriors led by Sir William Johnson, Britain's northern Indian superintendent. This reinforcement from the previously neutral Iroquois showed the shift in the balance of power in North America from France to Britain.

Prideaux's orders were for him to reestablish a fort at Oswego, capture Fort Niagara, and then advance to the headwaters of the St. Lawrence River in order to threaten Montreal and support Major General Jeffery Amherst's move north on Lake Champlain. In late May, Prideaux moved from Schenectady, New York, up the Mohawk River to Oswego, which he reoccupied and garrisoned on June 27. He then set out along the south shore of Lake Ontario for

Fort Niagara with a force of some 2,500 British regulars and provincial troops, about 1,000 Iroquois, and some artillery. They landed four miles to the east of Niagara on July 6 and immediately laid siege to its garrison of 600 French troops under the command of Captain Pierre Pouchot.

The French, unaware that the Iroquois had abandoned their neutrality, did not expect Fort Niagara to be attacked without substantial warning from their native allies. Therefore, they had detached most of their troops for service at Fort Machault. Pouchot attempted to recall them before the siege closed, but was uncertain of their response. Faced with the new reality, Pouchot sought to separate the Iroquois from the British. But the negotiations failed and he allowed his own Native American allies to leave the fort rather than rely on them to fight against their kin.

Prideaux conducted a traditional European siege, first shelling the fort from across the Niagara River, then building a series of trenches under covering fire. That brought his heavy guns close enough to batter the fort's walls. Although the engineers' plans were subjected to some criticism, the British bombardment put all the French guns out of action and forced a breech in the walls. The French could not make repairs under the constant fire.

On July 20, 1759, Prideaux died when he stepped in front of a mortar about to fire. This left Johnson in command just before the French reinforcements from Fort Machault arrived and attempted to relieve the besieged garrison. Johnson, aware of the approaching enemy, blocked the French advance down the Niagara River from Lake Erie and defeated them at the Battle of La Belle Famille on July 24, 1759. With no further hope of reinforcement, Pouchot surrendered his post on July 25 under guarantees of the safety of his garrison. The British, however, denied the French the military accolades that would have normally accompanied such a valiant resistance, the consequence of the native attack on prisoners that had followed the siege of Fort William Henry in 1757. The Iroquois subsequently plundered the fort and outbuildings but left the prisoners unmolested. Their own low casualties meant that the Iroquois had little need of captives as replacements.

The capture of Fort Niagara left Canada, particularly Montreal, open to British invasion from the west as well as via the St. Lawrence River and upstate New York. It also effectively removed the French from contention for control of the Ohio Valley and the interior of North America.

Fort Nohoroco (North Carolina)

Fort built by the Lower Town Tuscaroras around 1711, located on the east bank of Contentnea Creek (then Catechna Creek) in modern-day Greene County, North Carolina. Known by the Tuscaroras as Fort Nooherooka, Fort Nohoroco was erected on the orders of Chief Hancock, leader of the region's Tuscarora people, at the beginning of the Tuscarora War (1711–1713). The Tuscaroras built the redoubt in the European tradition, helped probably by an escaped slave whom the tribe had taken in.

Fort Nohoroco was a palisaded structure with earthen walls in which holes had been made for firing guns. There was at least one blockhouse, a battery, and structures within the walls designed to protect civilians. Surrounding Fort Nohoroco were a series of trenches and a moat blocking direct access to the redoubt from the landward side. The other sides of the fort took advantage of natural defenses, including a marshy swamp and the steep banks of Catechna Creek. Fort Nohoroco was one of four defensive works that Hancock ordered built during this period.

In September 1711, the Tuscaroras of North Carolina attacked white settlements at New Bern and Bath. Scores of settlers died in the assaults, which signaled the beginning in earnest of the Tuscarora War. South Carolina became embroiled in the conflict when officials there dispatched troops to help their neighbors to the north. Fighting continued, though in early 1712 a lull occurred when South Carolina forces negotiated a short-lived peace treaty with the Tuscaroras. By year's end, however, the war resumed.

In 1713, a force of South Carolina militiamen and allied Native Americans marched north to meet the Tuscaroras head on. Colonel James Moore Jr. headed the expedition. In March 1713, Moore decided to attack Fort Nohoroco, where Hancock had taken up residence. It was also the last well-fortified Tuscarora post.

A pitched battled ensued at Fort Nohoroco that lasted the better part of three days. The Tuscaroras fought to the bitter end, even though they were badly outgunned. The South Carolinians finally seized control of the fort, which they then burned to the ground. Hundreds of Tuscaroras were either killed in the fighting or burned to death in the destruction of the fort, Hancock probably among them. The battle at Fort Nohoroco marked the end of the Tuscarora War.

Fort Normanock (New Jersey)

British post erected during December 1755–January 1756 along the Delaware River in northwestern New Jersey (Sussex County), near present-day Newton. Fort Normanock, also known as Namanock, Nomanoc, or Nominack, was situated opposite Namanock Island and was one of several frontier forts built during the French and Indian War (1754–1763). It is believed to have been one of the larger of these installations. It stood on an elevation about a quarter-mile from the river with a view of the opposite bank and was about eight miles north of Fort Johns, the headquarters for the defensive line, on the Old Mine Road.

Late in 1755 the Delawares broke with the Covenant Chain (an alliance dominated by the Iroquois), sided with the French in the French and Indian War, and initiated a series of attacks on English settlements. Sussex County, which had just been formed in 1753, was relatively isolated and had a population of only about 600 people. Thus, in December 1755, the New Jersey legislature authorized four blockhouses and the garrisoning of 250 men along the Delaware River to provide for the safety of the county's residents. By 1757, six blockhouses had been built. Fort Normanock was constructed on property belonging to Cornelius Westbrook.

There were more attacks in 1756, as the Delawares were reportedly encouraged by the fall of Oswego on Lake Ontario. In August 1758, after further attacks, New Jersey officials and the Delawares reached a settlement regarding land claims, and much of the violence ceased. During Pontiac's Rebellion (1763), however, on November 17, 1763, Captain Benjamin Westbrook and 11 soldiers were attacked when they ventured from Fort Normanock to recover abandoned cattle and supplies in Pennsylvania, just across the river. Westbrook and 5 others were killed in the ambush.

The site of Fort Normanock is currently within the Delaware Water Gap National Recreation Area. An archaeological investigation of the site commenced in 2001, as the particulars of the post's size and physical characteristics are largely unknown.

Fort Norris (Pennsylvania)

Pennsylvania post constructed in 1756, located between present-day Kresgeville and Gilbert in Monroe County. Fort Norris was one in a series of provincial fortifications built during the French and Indian War (1754–1763) in western Pennsylvania, which was enabled by the Supply Act of November 1755. It appropriated funds to be spent by seven commissioners for raising troops, erecting forts, and garrisoning installations. The commissioners proposed four posts within the early Northampton County (now Carbon, Lehigh, Monroe, and Northampton counties), north of Blue Mountain. Fort Norris, one of these stockades, was named after Isaac Norris, Speaker of the provincial assembly.

Fort Norris was constructed after Native Americans killed a small band of settlers that soldiers had accompanied to its site. Completed in February 1756, it stood 15 miles east of Fort Allen, a sister post in the chain. Fort Norris contained a cluster of structures in a square stockade that measured 80 feet per side. Four half bastions mounted two swivel cannon each. The surrounding woods were cleared for 400 yards around the post.

A company commanded by Captain Jacob Orndt, one of three detailed to erect Fort Norris, remained as its 50-man garrison. Orndt obtained a fresh appointment in April 1757 and stayed until October. A first-rate soldier, he had built a strong fortification and maintained it well. Yet mutinous troops complained about wages, provisions, and discipline. Consequently, the garrisons of Fort Norris and Fort Allen exchanged places, with Captain George Reynolds replacing Orndt. Fort Norris's troops helped to guard the Easton Conference in July 1757. Shortly thereafter, in September, Fort Norris was abandoned.

Fort of the Six Nations (New York)

See Fort Ontario (New York)

Fort Ontario (New York)

British fort located on high ground on the east bank of the Oswego River overlooking its junction with Lake Ontario. The post changed hands many times during its existence. Fort Ontario was part of the Oswego fort system originally ordered by Gov. William Burnet in 1728 to provide protection against native attack. Fort Oswego was the first constructed, and was on the east bank of the Oswego River; the other two forts in the system, Fort Ontario and Fort George, were on the west bank of the Oswego. The three forts were built to protect British access to Lake Ontario via the Oswego River.

The British constructed Fort Ontario, also known as the Fort of the Six Nations, in 1755 during the French and Indian War (1754–1763). It consisted of a square log palisade with four bastions, surrounded by a moat. Unfortunately for the British neither Fort Ontario nor the other two forts in the system had been planned or built well.

On August 11, 1756, French major general Louis-Joseph, Marquis de Montcalm, arrived with a mixed Canadian and Native American force of about 1,500 men. He decided to invest Fort Ontario first. The next day Montcalm's artillery train of 80 guns and roughly 1,300 regular troops came up. Montcalm's men used the cover of a small ridge less than 100 yards from the fort to begin construction of a trench parallel to the fort's eastern wall. They then erected platforms for their guns to enable them to fire point blank into the fort's walls. Recognizing the hopelessness of the situation, British commander Lieutenant Colonel James F. Mercer ordered Fort Ontario abandoned on the 13th, withdrawing its garrison to Fort Oswego.

The French then occupied Fort Ontario and placed a dozen guns on the high ground next to the fort in position so as to be able to fire on the other two British forts. Fort Oswego's guns had been sited to fire in the opposite direction, and Mercer now ordered them reversed on their platforms, but the gunners were unprotected and had to fire over the heads of the friendly garrison to reach Fort Ontario. Early in the sharp exchange of fire that followed on August 14, Mercer was decapitated by a French cannon ball. The new commander, Lieutenant Colonel John Littlehales, surrendered after about an hour. Native Americans killed between 30 and 100 of the British wounded and some unwounded prisoners and made captives of a number of others before Montcalm was able to arrest the butchery. The French then marched approximately 1,700 British prisoners to Montreal.

The French destroyed the Oswego fort system on August 19. French forces now had control over Lake Ontario. They had also strengthened their lines of communication to the western outposts, especially Fort Duquesne.

The site of Fort Ontario remained abandoned until British major general Jeffery Amherst ordered a new pentagonal-shaped fort constructed there in 1759. During the American Revolutionary War, Fort Ontario served as a base for Loyalist raids into New York. The British abandoned the fort in 1777 and in 1778 Patriot forces

destroyed it. In 1782, the British reoccupied the site and did not hand it over to the United States until 1796. During the War of 1812, the British attacked and destroyed the fort, then fallen into disrepair. The star-shaped Fort Ontario that exists today was constructed during 1839–1844 but was never finished. During 1901–1905, the U.S. Army expanded the site and by 1941 there were 125 buildings there. During World War II, Fort Ontario became a refugee center for victims of the Holocaust and in 1946 was transferred to the State of New York. Fort Ontario has since been restored to its 1868–1872 appearance.

Fort Oplandt (Delaware)

See Fort Swanendael (Delaware)

Fort Orange (New York)

Dutch post established in 1624, in the upper Hudson River Valley, near the site where Henry Hudson had dropped anchor in 1609 (modern-day Albany). Fort Orange became the first permanent settlement in New York. Captain Cornelis May brought a group of Dutch West India Company traders to the west bank of the Hudson River, where they built a small log structure near the site of the abandoned, flood-damaged Fort Nassau (New York). Among the first settlers were five women, four of whom reportedly were married on the voyage from Europe. They were chiefly refugee Walloons, natives of the southern Netherlands (present-day Belgium), which at the time was occupied by Spain. Under the command of Adriaen Jorise, the settlers were paid employees of the company, and their job was to trade with the native population for furs.

The Mahicans soon approached Fort Orange to open trade relations. By spring 1625, Fort Orange sent some 1,000 otter and beaver pelts to the Netherlands. The Mohawks, one of the Iroquois Nations, moved to monopolize trade with the Dutch by driving off the Algonquian-speaking Mahicans. The company wished to maintain trade with both nations, and at times sold firearms to both, but could not control events. As the two tribes fought to dominate the region, Dutch attempts to intervene only resulted in the murder of several traders.

In 1626, Peter Minuit became director general of New Netherland. Concerned about the safety of Fort Orange's settlers, he ordered them to vacate the fort and move to farms around New Amsterdam, 125 miles downriver. By 1628, most New Netherlanders lived at New Amsterdam, and only a couple dozen traders and a few soldiers remained at Fort Orange.

Because of its location at the crossroads of native trade routes, Fort Orange became the center of the fur trade. The native people eagerly traded with the West India Company because, unlike the French and English, the Dutch were willing to sell them firearms. The fort's traders brought in some 63,000 pelts between 1624 and 1632.

In 1629, Kiliaen van Rensselaer instructed agents to purchase large tracts of native land along the Hudson and surrounding Fort Orange. He established a patronship (a proprietary manor), called Rensselaerswyck. In the meantime, the West India Company ceded its trade monopoly, and individual traders settled around Fort Orange to conduct business. A settlement known as Beverwyck (Beaver Town) grew up around the post and attracted an assortment of European and native traders. The traders of Rensselaerswyck and Beverwyck competed, acrimoniously, for the fur trade, and around 1644 Van Rensselaer employees built a trading post a few miles south of Fort Orange.

By the 1640s, the wooden walls of Fort Orange had decayed from regular flooding and retained little defensive value. And only a token garrison occupied the fort. However, the surrounding traders maintained amicable relations with the Mohawks and the other Iroquois Nations during the Dutch-Indian Wars (1641–1664). The traders continued to distribute firearms and accumulate furs. At various times during the hostilities, New Netherland officials and Native American sachems (chiefs) met at Fort Orange to conclude peace treaties.

Petrus Stuyvesant, governor of New Netherland, near the site of Fort Orange in 1649, ordering that houses in the adjacent village of Beverwyck (later Albany, New York) be pulled down in order to enlarge the fort's defenses. Wood engraving from 1878. (The Granger Collection)

After van Rensselaer's death in 1643 or 1644, his son, Johannes, appointed a new director, Brant Arentse van Slechtenhorst, who arrived in Rensselaerswyck in 1648 and pursued an aggressively expansionist policy. Van Slechtenhorst ordered the construction of new homes encroaching on Fort property. Petrus Stuyvesant, director general of New Netherland, ordered the garrison strengthened and the newly built buildings demolished. After years of contention, in 1652 Stuyvesant jailed the patronship's director and declared Beverwyck the only legal community near the fort.

When the English landed on Long Island in 1664, Stuyvesant recalled the Fort Orange garrison to defend New Amsterdam. After capturing New Amsterdam, English colonel Richard Nicholls sent George Cartwright to secure Fort Orange. Cartwright captured the fort without a fight and made treaties of friendship with the Mohawks and other native peoples. Cartwright changed the name of Beverwyck to Albany, and Fort Orange became Fort Albany. During the brief Dutch reconquest in 1673, Fort Albany received the name Fort Nassau.

Fort Orléans (Missouri)

French garrison built in 1723 on the north bank of the Missouri River, approximately two miles above its confluence with the Wakenda River. Fort Orléans was the first French military post in the Missouri River Valley. The Compagnie des Indes (Company of the Indies) sought to establish a fort on the Missouri River and an alliance with the Comanches against the Spanish. The French hoped that the post would deter the Spanish from making further attempts to invade French territory.

In January 1722, the Company of the Indies instructed Étienne de Vénieard de Bourgmont (also identified as Bourgomond) to lead an exploration party from New Orleans to the Missouri River Valley. Bourgmont was well suited for the job, as he was an adventurer, explorer, frontiersman, and civil and military administrator at various times in his career. In February 1723, the expedition departed New Orleans, traveling up the Mississippi River to the Missouri River, and arrived at the site of the future fort on November 9–10, 1723.

Bourgmont named the site Fort Orléans in honor of the Duc d'Orléans, regent of France. The works were built shortly after the expedition had settled. The fort itself was rather rudimentary in construction, with interior edifices made of wood and mud with thatched roofs. Bourgmont, who supervised construction, remained at the fort for a short time before returning to New Orleans. During this period he made a peace treaty with the Comanches to allow for a safe trade route to New Mexico. In July 1725, Bourgmont arrived in New Orleans with a delegation of representatives from the Oto, Osage, and Missouri tribes who accompanied him to Paris that September.

Fort Orléans remained an active fort for four years after Bourgmont's departure. In 1727, however, the Company of the Indies decided it was an economic failure and ordered the garrison reduced from 15 men to 8. Two years later, the post was abandoned altogether.

Fort Oswego (New York)

British trading post and series of fortifications situated along the southeastern shore of Lake Ontario. The Oswego forts represented an English toehold on the French-dominated Great Lakes. Construction on Fort Oswego began in 1727 to counter the French presence at Niagara. New York's Gov. William Burnet ordered a stone blockhouse built on a bluff just west of the mouth of the Oswego River, overlooking Lake Ontario. With tensions with the French increasing in the early 1740s, the English enclosed the blockhouse with a four-foot-thick stone wall with corner bastions. The post, officially called Fort Pepperrell, remained known as Oswego to the English and Chouhagen to the French.

In 1755, after the start of the French and Indian War (1754–1763), Gov. William Shirley of Massachusetts occupied Oswego with provincial forces in preparation to attack Fort Niagara. Concerned about Fort Oswego's relative weakness, especially heights to northeast and southwest overlooking the original post, Shirley ordered additional fortifications constructed. To the north, across the river, the men constructed Fort Ontario (the East Fort). It was a roughly 200-foot-square log stockade enhanced by additional outworks centered on each wall, giving it an octagonal appearance. To the southeast, the men began Fort George (Fort Rascal or the West Fort), a 170-foot-square earthwork that was never completed or equipped with artillery. Meanwhile, Shirley's 1755 Fort Niagara campaign faltered and plans for an offensive the following year stalled.

While the English sat idle at Oswego, Canadian leaders persuaded the French commander, Major General Louis-Joseph, Marquis de Montcalm, to shift forces to Lake Ontario and eliminate the English presence. On August 10, 1756, more than 3,000 French

Illustration of Fort Oswego, New York. Located on the southeastern shore of Lake Ontario and constructed by the English in 1726, the fort was captured by the French in 1756 and razed, but was later rebuilt by the English. (www.canadianheritage.ca ID #10163, National Archives of Canada C-9418)

troops, militiamen, and Native Americans landed near Oswego. Focusing on Fort Ontario, French artillery quickly made the British position untenable. The fort's commander, Colonel James Mercer, ordered his men to abandon the post. This decision gave the French a position that overlooked the other works. Facing the inevitable, the garrison at Fort Oswego surrendered on August 14, 1756. The French took nearly 1,600 prisoners. Rather than occupy the post, Montcalm's forces razed it.

The British reestablished their presence at Oswego in late August 1758. At that point, Lieutenant Colonel John Bradstreet occupied the old fort's location and then launched a daring attack against Fort Frontenac. After destroying the French post, Bradstreet's 3,000 men returned to Oswego. The following year, while preparing for a campaign against Fort Niagara, British forces under Brigadier General John Prideaux constructed a new pentagonal fort, some 190 feet square, on Fort Oswego's site. Though Niagara fell in July, it proved impossible to redeploy the army to assault the St. Lawrence Valley. In August 1760, Major General Jeffery Amherst and an army of some 10,000 men left Oswego for an offensive down the St. Lawrence River. This, combined with two other British advances, crushed New France.

With the fall of New France, Fort Oswego became little more than a way station for forces en route to the western posts. Though Oswego did not play a major role in Pontiac's Rebellion (1763), Sir William Johnson and Native American leaders signed a final peace treaty at Oswego in July 1766, officially ending that conflict. The post later played a significant role in the American Revolutionary War.

Fort Pelham (Massachusetts)

One of four forts built by the colony of Massachusetts between the Connecticut River and the New York border during King George's War (1744–1748). Fort Pelham was completed in early 1745. Massachusetts officials hoped that the posts would prevent French and Native American raiding parties from reaching the more southern and eastern settlements. They also saw them as places of refuge for local settlers.

Fort Pelham was constructed on the site of modern-day Rowe, Massachusetts, during the winter of 1744–1745. The location was chosen for its proximity to one of the main routes that might be used by natives in raiding other settlements. Previously, settlers had built fortified homes at their own expense, where they and their neighbors could take refuge. These improvised forts were of no use in halting raiding parties, however. When he learned of war between France and Great Britain in May 1744, Gov. William Shirley of Massachusetts ordered four forts to be built and paid for with public funds. Fort Shirley was constructed between August and October 1744 under the supervision of Captain William Williams.

After completing Fort Shirley, Williams supervised construction of Fort Pelham, only six miles away. Both posts were garrisoned by Massachusetts provincial troops. The normal garrison for Fort Pelham, which was named after the English minister Henry Pelham, was approximately 20 men.

Fort Pelham was similar in construction to Fort Shirley. Workers cut white pine trees in the area down to logs approximately 6 inches thick and 14 inches high. They laid them in courses one on top of the other and secured the logs with oak pegs, until they formed a wall 12 feet high. They then dovetailed the walls together at the corners for added strength. They were proof against muskets, but would not have been able to withstand cannon fire. To provide an enfilading fire, two watch boxes 12 feet square and 7 feet high were erected at opposing corners. The area enclosed by the walls amounted to approximately one and a half acres. A ditch surrounded the entire fort.

Up to 350 militiamen garrisoned Shirley's defensive line, including Fort Pelham. Each fort was within view of the next, and groups of soldiers patrolled regularly between them. Fort Pelham did not come under attack during King George's War, and after the war its garrison dwindled to a single watchman. The fort was allowed to deteriorate, and by the early 1750s the English had abandoned it altogether.

Fort Pentagouet (Maine)

French garrison constructed in 1635 and located at the mouth of the Bagaduce River on Penobscot Bay, near present-day Castine, Maine. The French built Fort Pentagouet to secure their control over the local fur trade and to assert their territorial claim to Maine north of the Kennebec River.

In 1633, King Charles I of England ceded the eastern portion of the Maine coast to France. In 1635, French entrepreneurs, anxious to cement their title to the land and its trading revenue, erected Fort Pentagouet, a complex of stone and earthen fortifications, on the site of an earlier English trading post. The fort's mission was to defend the river and nearby French settlements from attack, but its usefulness was vitiated by its location, which had been chosen for commercial potential rather than defensibility. Fort Pentagouet was square in shape with four stone and earth bastions. It enclosed a 60-foot parade field.

In 1654, at the opening of the Second Anglo-Dutch War (1654–1667), English forces captured Pentagouet and maintained a garrison there over the following decade. At war's end, England returned Acadia to the French, who took possession of the fort in 1670. Although Pentagouet was now to be Acadia's capital, French king Louis XIV failed to support the fort with serious commitment of money or men. As such, Dutch privateers captured it in 1674; later that year Massachusetts soldier Samuel Mosley and his band of militiamen drove the Dutch out and razed the fort. French officer Jean Vincent de Saint-Castin took control of the area for the French around 1677. Aware of the site's deficiencies, he abandoned the ruins of Fort Pentagouet and established a new settlement farther up the Bagaduce River.

Fort Picolata (Florida)

Spanish garrison built in 1734 on the banks of the St. Johns River, approximately 20 miles west of St. Augustine. Although the post was not named until the 18th century, a Spanish garrison had occupied a crude outpost in the same area since the late 17th century. Fort Picolata was constructed in anticipation of both English and Native American offensives into Spanish Florida. When completed, the fort boasted a barracks, a blockhouse, and storehouses. It also mounted a few small cannon. The Spaniards assigned a garrison of 10–12 soldiers to the post. To bolster Fort Picolata's defenses, the Spaniards constructed Fort San Francisco de Pupo on the opposite bank of the river.

Fort Picolata's location granted the Spaniards a military presence on the route between St. Augustine and Apalachee Province. Because Fort Picolata never housed more than a dozen soldiers and often fewer than eight, the outpost demarcated Spanish territory more than providing protection for Spanish interests in the area.

When James Oglethorpe of British-held Georgia prepared to invade Florida in the final months of 1739, Fort Picolata became the site of the first attack in the British invasion. While on a reconnaissance mission, British soldiers stumbled upon Fort Picolata and attempted to rout the Spanish unit. According to a report, 7

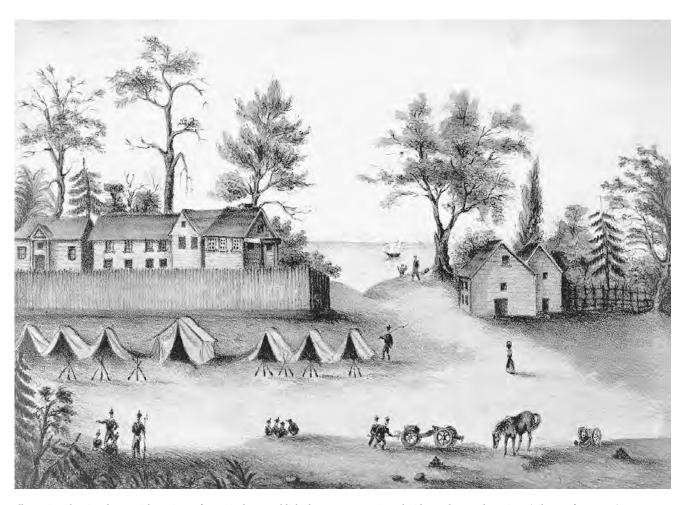

Illustration showing the Spanish garrison of Fort Picolata, established near St. Augustine, Florida, on the St. Johns River. (Library of Congress)

Spaniards deflected an attack by nearly 50 British soldiers and Native Americans. In January 1740, the British returned with a larger force and destroyed the fort. The destruction of Fort Picolata and its sister outpost, Fort San Francisco de Pupo, marked the only victories in Oglethorpe's Florida campaign.

In 1755, the Spanish rebuilt the fort, only to neglect the outpost shortly thereafter. When the British assumed control of Florida in 1763, Fort Picolata fell into a state of complete disrepair. Today the site of the former fortification has been the subject of several archaeological excavations.

Fort Pitt (Pennsylvania)

British fort named for political leader William Pitt, established in 1759, at the Forks of the Ohio River. The construction of Fort Pitt began soon after Brigadier General John Forbes's successful 1758 march across Pennsylvania during the French and Indian War (1754–1763) and the subsequent French abandonment of Fort Duquesne. Fort Pitt controlled the Forks of the Ohio and its protection attracted traders and settlers to the area, which ultimately became the city of Pittsburgh.

Unlike its predecessors, Fort Prince George, built by the Ohio Company, and Fort Duquesne, built by the French but abandoned and destroyed in the face of Forbes's approach, Fort Pitt was a massive pentagonal fort with five bastions, a ditch, a glacis, and very strong and thick walls. A garrison of more than 1,000 men and more than 20 field cannon could be accommodated within the fort's walls. The careful engineering of Fort Pitt demonstrated British resolve to retain the post no matter what.

Although Fort Pitt's strength deterred the French from attempting to descend the Allegheny River to repossess the Forks of the

Contemporary map of the Ohio and Muskingham rivers area showing Native American towns and forts in 1764. (Library of Congress)

Ohio, it remained logistically vulnerable at the end of Forbes's long road from Carlisle. From June to August 1763, in the early stages of Pontiac's Rebellion, native warriors subjected the fort to a loose siege. Whereas British garrisons farther west were surprised or tricked into losing their posts, alert colonials at Fort Pitt picked up signs of trouble before the war began. Contact with other British outposts was maintained through fast riders, and Fort Pitt became a refuge for survivors of British military reverses along the frontier as well as settlers whose presence in the area had done so much to provoke the fighting. The garrison of regulars commanded by Captain Simeon Ecuyer, the militialed by trader William Trent, and the refugees from the surrounding countryside were saved from eventual starvation by Colonel Henry Bouquet's victory at Bushy Run.

Fort Pitt proved less resistant to the rivers than to enemy forces, however. The fort flooded in both 1762 and 1763, and the damage was never fully repaired. Native Americans, lacking the siegecraft of European soldiers, were unable to take advantage of these weaknesses. Fort Pitt remained at the center of Pittsburgh as the town

grew into a city, at least until the fort's military purpose became obsolete as the frontier line moved west. It was largely abandoned in 1772, only to be reactivated in 1774 as Fort Dunmore.

Fort Pitt (Pennsylvania), Siege of

Start Date: June 1763 End Date: August 1763

The siege and relief of Fort Pitt, which took place during June–August 1763, were pivotal events in the eventual failure of Pontiac's Rebellion (1763). Built near the site of an earlier French post (Fort Duquesne) at the confluence of the Monongahela River and Allegheny River, the British installation was a much larger complex of five bastions, protecting two acres of land within its curtain walls. The fort's commanding position above the Forks of the Ohio River made it a key strategic site for both European and American Indian peoples. Additionally, the military base was headquarters for the first battalion of the 60th (Royal American) Regiment of Foot, which provided manpower for other garrisons scattered along Forbes Road and throughout the Great Lakes watershed.

When warriors overran satellite detachments at Sandusky, Presque Isle, Venango, and Le Boeuf in May and June 1763, the survivors withdrew to Fort Pitt. Captain Simeon Ecuyer, commander of Fort Pitt, immediately undertook preparations for the post's defense. These included razing outside buildings, sowing the expansive glacis and ditches with antipersonnel devices, establishing regular watches, and placing the 540 people inside the fort on short rations.

Fort Pitt's extensive defenses and artillery made a direct assault by risk-averse warriors an unlikely event. Instead, the attacking Delaware and Shawnee warriors conducted night attacks to keep the garrison on edge. They also used their control of the country-side to great advantage by driving off pastured livestock and then engaging any forage parties who appeared from the fort. Invitations to parley with the besiegers frequently followed close on the heels of their furtive strikes in attempts to crush both the defenders' resistance and morale. British delegates were informed at these conferences that no aid would arrive because neighboring detachments had already been destroyed by superior numbers soon to be arrayed against them.

The Native American negotiators proffered assurances of an unimpeded withdrawal down Forbes Road in return for surrender. Having already learned about the terrible fate of other British forces who had surrendered, however, Captain Ecuyer used the same strategy as the opposing chiefs to exaggerate his strengths and spread misinformation about army intentions. He once even distributed to those threatening the lives of his dependents smallpox-infected blankets disguised as presents.

Covert pathogens apparently had no detrimental effect on war parties, whose strength and aggressiveness increased throughout the summer months. Finally, near the end of July, the Native Americans launched a sustained attack on the fort over five successive days. They inflicted little real damage to the post, however, and American Indian tactics changed thereafter. A screen of tribesmen remained in position around the fort, while a powerful cohort of 110 braves was detached to prevent British reinforcements from reaching Fort Pitt.

As in earlier irregular actions, the initiative lay with warriors waiting at Bushy Run who sought to destroy the relief column led by Colonel Henry Bouquet and thereby force the garrison either to starve or surrender. Bouquet's victory over the warriors ended their blockade, as they precipitously lifted the siege and went in search of easier targets.

The American Indian failure to destroy Fort Pitt and its garrison had major repercussions for Shawnee and Delaware communities the following year. Fort Pitt became the logistical and administrative center for Bouquet's 1764 Ohio offensive, which forced the native insurgents to sue for peace.

Fort Pleasant (West Virginia)

British post constructed in 1756, situated along the South Branch of the Potomac River, at the present-day site of Old Fields, West Virginia, close to the town of Moorefield. Fort Pleasant was one of a chain of forts constructed by the Virginia government in 1756. The forts were designed to protect the colony's northwestern border after the defeat of British forces under Major General Edward Braddock in 1755 during the French and Indian War (1754–1763). Fort Pleasant played an important role in providing security for local settlers against Native American raids and as a civil and economic center during the Colonial Period.

Following Braddock's defeat, Colonel George Washington assumed command of the Virginia Regiment and began constructing a line of forts to protect Virginia's northwestern border. In early 1756, Washington ordered Captain Thomas Waggener to take a company from Fort Cumberland to the South Branch of the Potomac. Washington had conducted a survey of the area when he was a teenager. Waggener consulted with local residents about the best locations for two forts. Waggener constructed Fort Pleasant, also known as Fort Van Metre, on the site of the home of Isaac Van Metre, a local landowner who had built a rude fortification there in 1744 to protect his property from Native American attack. The location provided a good view of the surrounding territory.

Work on Fort Pleasant began in late January or early February 1756 and was completed by May of that same year. Washington had instructed Waggener to follow the pattern of earlier forts in its construction. Surviving plans indicate that the fort was a rectangle with sides between 60 and 90 feet long. At each corner there was a bastion to allow enfilading fire on any enemy force attacking the walls. The walls were built of upright logs about 10 feet high, with loopholes cut in them to allow the garrison to fire on attackers. Several cabins within the walls served as barracks and storehouses. The fort's garrison numbered approximately 60 men.

During the French and Indian War, Fort Pleasant also served as the center of government for Hardy County. Court was held within the walls, and legal documents were recorded and preserved inside. When Native American raiding parties were rumored to be in the neighborhood, local settlers took shelter in the fort. In theory, the garrison patrolled the region and chased after raiders. However, personnel shortages usually prevented aggressive actions.

In the late summer of 1756, a group of militiamen from a neighboring fort chased after a group of raiders and the natives managed to trap the militia against the Potomac River. Although the fighting was clearly audible at Fort Pleasant, Captain Waggener refused to allow members of the garrison to lend aid. At least one story claims that he refused to open the gates to two survivors. This Battle of the Trough was the most important military action near Fort Pleasant.

After the capture of Fort Duquesne, the danger from Native American raiding parties declined. Enterprising merchants cut a road from Fort Pleasant to Patterson Creek, so supplies could be shipped more easily to the garrisons in western Pennsylvania. Fort Pleasant subsequently became a collection center for agricultural products and an important economic center for the region. The town of Moorefield eventually took over the civil and economic functions of Fort Pleasant. The English abandoned Fort Pleasant in February 1762. Its fortifications were allowed to fall into ruin, although in 1770 fortifications were again constructed at the site for local militia.

Fort Prince George-Keowee (South Carolina)

Garrison built in 1753 across the Keowee River from the Cherokee Lower Town of Keowee, now the site of Clemson, South Carolina. Named for the Prince of Wales who later became King George III of Great Britain, Fort Prince George (also called Fort Keowee) functioned as the primary military and trading post to the Cherokee Lower Towns during the period 1753–1768. This post played a key role in British, South Carolinian, and Cherokee diplomacy throughout its existence.

Fort Prince George consisted of a guardhouse, barracks, a kitchen, a storehouse, and the commandant's quarters. It was approximately 200 feet square and had earthen walls crowned with a palisade of logs. Diamond-shaped bastions armed with mounted, swivel cannons protruded from the four corners of the fort and a five-foot-deep ditch surrounded the entire complex.

Fort Prince George played a pivotal role in the Cherokee War of 1759-1761. Responding to isolated attacks by Cherokees on the South Carolina frontier in 1759, Gov. William Henry Lyttelton placed a Cherokee peace delegation in chains, assembled an army of provincial troops and militia, and then marched to Fort Prince George in a show of force intended to intimidate the Cherokee Nation. The captive Cherokees, headed by Oconostota, had gone to Charles Town (present-day Charleston) in a good-faith attempt to prevent open warfare. On arrival at Fort Prince George, Lyttelton and his army were confronted by a smallpox outbreak in the Cherokee town of Keowee. Faced with growing desertions, Lyttelton freed some of the Cherokee captives, including Oconostota, but held the rest hostage until all the warriors that had raided the Carolina frontier were turned over to the garrison. Lyttelton then declared the Cherokees chastised, disbanded what was left of his army, and marched back to Charles Town in triumph.

Under the leadership of Oconostota, the Cherokees attempted to free the remaining captives in Fort Prince George. They ambushed its commander, Richard Coytmore, and attempted to take the fort by surprise, but ultimately failed in this endeavor. The death of Coytmore, however, sealed the fate of the Cherokee captives, who were slaughtered by the fort's garrison. This act led to an intensification of the Cherokee War, which lasted until 1761. Fort Prince George came under periodic attack during the remainder of the war. It also served as the launching pad for two major campaigns against the Cherokees in 1760 and 1761. These campaigns were conducted primarily by British regular troops, and these expeditions eventually led to the end of the war.

South Carolina rebuilt Fort Prince George during 1756–1765. The fort was manned by provincial troops known as the South Carolina Independent Companies. The South Carolina colonial government had formed these units out of Major General James Oglethorpe's 42nd Foot Regiment, which was disbanded in 1749. Afterward, the ranks of the Independent Companies were filled out by recruits from South Carolina. The fort was evacuated in 1768.

Fort Prince George-Palachacola (South Carolina)

British fort built in 1723 on a bluff overlooking the Savannah River, about 50 miles from the river's mouth. Fort Prince George, also known as Palachacola Fort, guarded the main route to Charles Town (present-day Charleston, South Carolina) from the south and southwest. The fort was also the site of sporadic trading.

The Yamasee Native Americans had acted as a defensive buffer in the southern and western parts of South Carolina until they rebelled in the Yamasee War (1715–1717). Thus, Captain William Bellinger established Fort Prince George in 1723 at the site of the former Native American village of Palachacola to help bolster the colony's defenses after the Yamasee lands had been confiscated. He also hoped to control unscrupulous traders of the sort that had provoked the Yamasees to rebellion.

At the time, the Carolinians were less concerned with the Spanish military threat than with the recent appearance of French forts and trading posts along the Gulf of Mexico and in Creek Country in Alabama. Carolina Rangers, a semiprofessional military unit that guarded the southern frontier with mounted patrols, manned the fort. Fort Prince George was overshadowed by Fort Moore farther upstream when it came to trade.

The new colony of Georgia, chartered in 1732 and encompassing the territory south of the Savannah River, had been claimed for some time by South Carolina. Settlement began there in 1733, and Georgia took possession of the fort in 1735. Apparently, the fort was abandoned in 1742 during the Anglo-Spanish War of 1739–1744, by which time the site would have lost much of its frontier defensive value and troops would have been needed on the Georgia-Florida frontier.

Fort Prince William (Georgia)

English fort built in 1740 and located on the southern end of Cumberland Island to protect Cumberland Sound, Amelia Channel, the St. Mary's River, and the inland waterway approach along the Georgia coast. Named for Prince William Augustus, Duke of Cumberland, the structure was often referred to simply as Fort William. It was completed in April 1740, during the Anglo-Spanish War of 1739–1744, under the direction of Georgia governor James Oglethorpe.

Fort Prince William was part of an integrated network of defensive positions to protect against the Spanish threat from Florida. Fort St. Andrew was located at the opposite end of Cumberland Island and along with Fort William provided shelter for various ranger garrisons and artillery batteries to protect the coastal waterways. Fort Prince William has been described as a weak structure designed with a stockade and bastions at each corner for eight cannon. It was garrisoned by a small detachment of British rangers who carried messages between Fort William and Fort St. Andrew and patrolled the beaches on guard for Spanish ships.

On June 22, 1742, these troops spotted a fleet of 52 Spanish ships and boats poised to attack British possessions on St. Simons Island, north of Cumberland. The guns of Fort William exchanged fire with those of the Spanish vessels for more than an hour, but the Spanish ships were able to sail north toward St. Simons Island.

Following their subsequent defeat on land in the Battle of Bloody Marsh, the Spanish determined to destroy as many British outposts as possible as they withdrew back to St. Augustine. On July 16, a messenger from Fort St. Andrew ran the length of Cumberland Island to warn the 70 British soldiers and rangers at Fort Prince William of an impending Spanish attack. Two days later on the 18th the Spanish attempted to land 200 soldiers on the beach to destroy the fort. However, eight British rangers took positions behind sand dunes outside the fort and opened fire on the landing boats. The cannon of Fort Prince William also joined in. During an hour-long exchange of fire the fort sustained only some damage to the stockade. Frustrated at the effective British defense, the Spanish abandoned their attack and continued on toward St. Augustine.

In 1742, the English improved Fort Prince William by adding logs to retain a thick wall of sand. Two large guns were mounted on mobile carriages in a ravelin in front of the fort to provide added firepower. Unlike many fortifications of the period, which saw no activity for which they were designed, Fort Prince William passed the tests of effective location, protection, and firepower during the Spanish invasion of Georgia.

Fort Raleigh (North Carolina)

Fort Raleigh is the 21st-century term used to describe the system of fortifications associated with Sir Walter Raleigh's unsuccessful English colonization efforts on Roanoke Island, on the Outer Banks of present-day North Carolina. Construction of Fort Raleigh began in 1585 and was apparently completed by the end of August of that year, but the colony and associated fortifications were abandoned suddenly in 1587. Ralph Lane, a veteran of Queen Elizabeth's Irish misadventures of the late 16th century, designed the garrison and supervised its construction. Lane had previously designed and oversaw the construction of a fort used by the adventurers during a stopover in Puerto Rico.

The first documented mention of the fort is Lane's September 3, 1585, letter that gave his location as "the new fort in Virginia" to the noted advocate of colonization Richard Hakulyt the Elder.

When John White led an attempt to reestablish a community on the Outer Banks in 1587, he found that the fortifications on Roanoke Island had deteriorated. They were quickly repaired. White's group of colonists became legend as the "Lost Colonists." When White searched for the colonists in 1590, he reported that the fort was in ruins. And the colonists had vanished. It is quite likely that they fell victim to a Native American attack.

Archaeological examination of the site indicates that Fort Raleigh was actually a series of earth and wooden works rather than one single fortification. The main fort may have been square, set askew to take on a more star-shaped appearance. Each side was thought to have been 100 feet or less in length. Bastions extended out on its sides. Evidently the fort contained at least one structure. The fortification was not a small simple earthwork, but rather a complex interconnected system that was designed and built by combat veterans.

Fort Reading (North Carolina)

Fort Reading was the fortified plantation of Lionel Reading, located on the banks of the Pamlico River across from modern-day Wash-

ington, North Carolina. The plantation served as the most western fortified position on the Pamlico River and was used as a base of operations against the Tuscaroras during the Tuscarora War of 1711–1713. Its position was ideal for the settlers of the Bath Colony because it was situated across from Chocowinity Bay.

The position was initially fortified as a result of the massive Indian attack on September 22, 1711. Then Chief Hancock of the Tuscaroras led 250 warriors from six different tribes in an offensive to destroy every plantation in the Bath County. During this attack, the colonists abandoned their homes and concentrated at several fortified plantations. The Reading plantation was one of a few plantations that survived the initial attack, and it then became a staging point for the colonial counterattack against the native tribes in northeastern North Carolina.

Fort Reading became the base for Captain John "Tuscarora Jack" Barnwell's South Carolina forces and his native allies in their campaign against Chief Hancock. It was the staging point for Barnwell's assault of the Tuscarora town of Narhantes on January 29, 1712, and it was later the site for the arranged peace in May 1712. South Carolina forces under Colonel John Moore also used the fortification when they moved north into Albemarle County to fight the Tuscaroras during 1712–1713.

Fort Redstone (Pennsylvania)

See Fort Burd (Pennsylvania)

Fort Richmond (Maine)

British fort built in 1719 along the west side of the Kennebec River, some 25 miles from the coast near the modern-day city of Richmond, Maine (then part of Massachusetts). Fort Richmond was designed to protect English settlements along the lower Kennebec River from attacks by Native American raiding parties. The post was enlarged during Dummer's War (1722–1727) and again before King George's War (1744–1748). Fort Richmond housed an important trading post that allowed Native Americans to exchange furs for European products. Its greatest service was as a staging area for a 1724 raid against the Abenaki tribe that killed Father Sébastien Râle (Battle of Norridgewock).

The Massachusetts colonial government authorized the construction of the palisaded Fort Richmond to protect the growing settlements downriver. Earlier conflicts, such as Queen Anne's War (1702–1713), had demonstrated these settlements' vulnerability to attacks by the Abenakis. Although the garrison at Fort Richmond numbered only around 20 men, it nevertheless provided safe refuge for local settlers.

When Dummer's War began between Massachusetts and the Abenakis in 1722, most English colonists blamed Râle for inciting the natives to violence. In 1723, Massachusetts officials enlarged and further fortified Fort Richmond. Although it never came under direct Abenaki attack, native warriors were often observed in the area. The fort served principally as a forward base for operations against the Abenakis. In January 1723, an expedition of 300 Massachusetts militiamen under Colonel Thomas Westbrook attacked Râle's mission. Although the Jesuit escaped, the buildings were looted and burned. Retaliation by the natives led Massachusetts leaders to mount another expedition. In August 1724, 200 men left Fort Richmond and rowed up the Kennebec River in 17 boats. Catching the Abenakis off guard, they killed Râle. At least 80 Abenakis also died in the raid, and the militia burned the village of Norridgewock, ending the Abenaki threat to English settlements along the Kennebec.

After the end of Dummer's War, merchants established a trading house at Fort Richmond. It served as the center of trade along the Kennebec River for the next 30 years. The fort was rebuilt in 1740 to replace rotting wood fortifications. Area settlers had come to believe that Fort Richmond was necessary to block a water route from Quebec to Massachusetts. After scouting expeditions proved that no such route existed, the fortifications were allowed to deteriorate. In 1754, Fort Western was built 15 miles farther upstream from Fort Richmond. The garrison then moved to the new fort and Fort Richmond was abandoned.

Fort Rosalie (Mississippi)

French fortification erected in 1716 along the Mississippi River, some 180 miles upstream from the river's mouth. During the first two decades of the 18th century, French explorers had traveled all along the Gulf Coast in hopes of establishing trade with local natives. Concerned with encroaching Spanish and English settlers

and traders, the French began constructing forts and communities from Mobile (Alabama) west to the Mississippi River. Trade with Native Americans became the most significant French interest in the region. Not only was such trade vital for colonial development and survival, but it quickly became an attractive means of profit. Deerskins found a large market in France and soon became Louisiana's most important export.

Their extensive trade network led the French to establish outposts along the Mississippi River. In 1714, Jean-Baptiste Le Moyne de Bienville ordered a storehouse built among the Natchez, roughly 180 miles from the mouth of the Mississippi River. Within two years, however, tension and conflict with the Natchez led the French to construct a fort at the site. They hoped this would help assert French hegemony in the region. Thus, in 1716 Fort Rosalie became one of the most important French trade settlements with natives along the Mississippi.

The main fortification was in a pentagon shape, roughly 200 feet across, surrounded by a stockade, moat, and fortified embankment. Within the central defenses stood barracks, a guard house, and armory. An outer stockade surrounded the fort in an irregular pattern, enclosing other structures and providing some security for the French community there. The garrison's main water and food supplies, however, lay beyond the fort's defenses.

Although Fort Rosalie was vital for French trade interests in the Natchez region, persistent tension and conflict with the local Natchez tribe plagued French settlement. In 1722, several Natchez men were killed inside the fort during a dispute over corn. In retaliation, Natchez warriors conducted raids against French colonists and property for a year.

A subsequent brutal French campaign against Natchez villages forced the natives to sue for peace. Over the next few years, relative calm and peace descended on the fort and neighboring Natchez. However, the change of governorship in Louisiana brought the appointment of Captain Sieur de Chepart to command Fort Rosalie. His abrasive personality and lack of tact with the Natchez led to disaster. In 1729, a coordinated Natchez revolt nearly wiped out the local French population and led to the Natchez War (1729–1733).

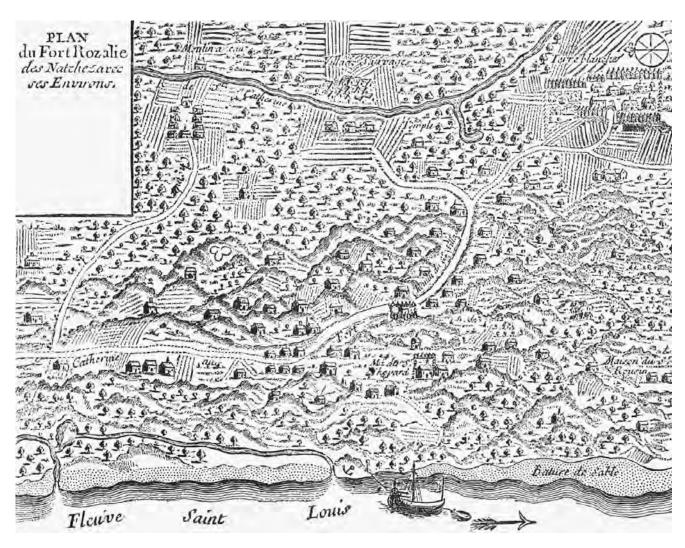

Following the destructive Natchez War, the French presence around Fort Rosalie was minimal. The French maintained a small garrison at the damaged fort until 1763, when the English took control under terms of the Treaty of Paris (1763).

The British then stationed a small detachment of men at the site, renamed the installation Fort Panmure, and repaired the defenses in the 1770s. The fort changed hands again in 1779, when the Spanish took possession of the region. The fort was passed to its final owner, the United States of America, after the Pinckney Treaty of 1795 with Spain.

Fort Royal (Virginia)

English fort constructed in 1645, located roughly 1.5 miles southeast of present-day West Point, Virginia, along the Pamunkey River. Sometimes referred to as Fort Mattapony, Fort Royal was designed to garrison militia troops. In 1645, a year after the outbreak of the Third Anglo-Powhatan War, the Virginia Assembly sought to create enhanced defenses to ward off future native attacks. Accordingly, it appropriated funds to construct three forts—Fort Royal, Fort Charles, and Fort James. All were located in

south-central and southeastern Virginia. In 1646, a fourth redoubt—Fort Henry—was erected near the falls of the Appomattox River (present-day Petersburg).

Fort Royal was a palisaded post that included at least one blockhouse. It was capable of garrisoning as many as 100 men, and during its first years of use its garrison was maintained at full strength. Those manning the garrison were militia troops as well as indigent laborers who would have found the regular pay associated with garrison duty a considerable benefit. Members of the garrison were expected to patrol and take part in offensive operations against the Pamunkeys, who had instigated the 1644 attacks.

Fort Royal became the base for an ambitious campaign to capture the Pamunkey chief Opechancanough during 1645–1646. When the chief sent word to Virginia's Gov. William Berkeley that he sought a peace settlement, Berkeley agreed to meet him at Fort Royal. He also planned to capture or kill Opechancanough when he arrived at the post. The chief arrived at the appointed time, and several men of the garrison attacked and killed the chief's entourage.

But the wily Opechancanough somehow managed to escape. When the plot to secure Opechancanough failed, Berkeley and a force of some 60 men from Fort Royal set out to track him down. They finally apprehended the Pamunkey chief and took him to the capital at Jamestown, where Opechancanough was then shot to death by an overzealous soldier. Fort Royal was abandoned sometime in the 1650s.

Fort Sandusky (Ohio)

Fort controlled by first the British and then the French, subsequently regained by the British. It was located on the north side of Sandusky Bay on the southern shore of Lake Erie (west of present-day Sandusky, Ohio). In 1745, the British established a fortified blockhouse on the site to protect British traders operating in the Ohio Country. The French seized the post in 1751 and built a more extensive structure, which they named Fort Sandusky. They abandoned it in 1754. The British regained it in 1761, and Major General Sir Jeffery Amherst ordered a new blockhouse built on the site of the former French works. This refurbished outpost was viewed by the local Wyandot tribe as an unwelcome indicator that the British, unlike the French, were there to establish authority and expand settlement on native lands.

During Pontiac's Rebellion (1763), Fort Sandusky was one of the first targets for the native uprising designed to destroy British frontier settlements. On May 16, 1763, seven Wyandots sought a council with Sandusky's commander, Ensign Christopher Paully. For more than two years, Paully and his men had lived among the Wyandots who frequently visited the fort to obtain trade goods, rum, or medical attention. Paully had no indication that this visit from men he knew was going to be any different. He also did not know that Detroit was already under siege and that what was about to happen at Fort Sandusky would occur simultaneously at other British outposts along the frontier.

When the warriors were admitted into the fort, they suddenly seized Paully. Before the gate guards could react, more natives poured through the entrance. They quickly set fire to the fort and slaughtered every British trader or soldier, save Paully. In addition, they seized more than 100 horse loads of trade goods as well as many guns and much ammunition before departing.

The Wyandots subjected Paully to beatings and other tortures as they journeyed toward their rendezvous at Detroit. He expected to be killed, but an Ottawa woman claimed the right to adopt him in place of her husband. After being bathed in a river, his head was shaved, his face painted, and Paully was accepted as an Ottawa warrior. However, Paully subsequently managed to smuggle a letter with a French trader who reported to Henry Gladwin at Detroit the fate of Fort Sandusky. Paully eventually escaped his captors and made his way to join Gladwin and the defenders under siege at Detroit.

Fort Sandusky was one of eight forts that fell to direct native attack in the spring of 1763. In less than two months, the natives of the Northwest had reduced the British presence in the region from almost 20 outposts to just the strongholds at Fort Pitt and Fort Detroit.

Fort San Francisco de Pupo (Florida)

Spanish fort first erected in 1714 along the west bank of the St. Johns River in northern Florida (La Florida), and west of St. Augustine. Fort San Francisco de Pupo and Fort Picolata both guarded the mouth of the St. Johns River. The nearby Florida-Georgia border contained highly prized trees for ship mast timbers, and so for that and strategic reasons, the area became a highly contested one between the Spanish and English.

Fort San Francisco de Pupo was originally located at Walkill Ferry as a wooden fort of unknown dimensions. In 1734, the Spanish rebuilt it with two imposing 30-foot towers of coquina masonry (native shell construction). The post was roughly 60 feet square in size and was surrounded by a shallow moat. The fort featured barracks, a blockhouse-style building, and storage facilities. Its nineman garrison had a few small cannon.

In 1739, the Anglo-Spanish War of 1739–1744 erupted as part of the larger competition for colonial empires, mostly between English Georgia and Spanish Florida. In December 1739, Georgia founder and governor James Oglethorpe set out to capture St. Augustine with 150 men and several war sloops. His west flank was protected by the friendly Creeks, Cherokees, and Chickasaws, who kept Spanish reinforcements from Pensacola under watch. Oglethorpe invaded Florida and captured the twin forts of San Francisco de Pupo and Picolata in January 1740, leaving a garrison of the Georgia Militia and a sloop at San Francisco de Pupo. Twelve Spanish soldiers died in the campaign. From May until June, Oglethorpe besieged St. Augustine's citadel, the Castillo di San Marcos, halting operations only when Spanish reinforcements threatened his rear.

A Spanish counterattack subsequently captured Georgia's Fort Frederica. In the meantime, the Spanish retook San Francisco de Pupo in May 1740.

After the French and Indian War (1754–1763) between England on one side and France and Spain on the other, Fort San Francisco de Pupo came under English control. It reverted to Spanish control in 1783 as part of the Treaty of Paris that ended the American Revolutionary War. The fort was little more than a crumbling curiosity noted in the logs of passing ships when it was ceded to the United States in 1821.

Fort San Juan (North Carolina)

Fort San Juan was constructed by Spanish explorers in 1566 in an area known as Worry Crossroads some 50 miles east of modern-day Asheville, North Carolina. The Spaniards were members of Captain Juan Pardo's expedition, which was attempting to discover a route from the Spanish port of Santa Elena (modern-day Parris Island, South Carolina) to the gold mines in Mexico.

It is believed that 30 soldiers garrisoned the fort initially, and this force mounted a smaller expedition to eastern Tennessee as Captain Pardo returned to defend Santa Elena. Pardo soon returned with an additional 120 men and prepared to push farther beyond present-day northern Georgia. He soon abandoned that attempt because of the possibility of a massive Native American attack against his men. The Spaniards stayed at this post for some 18 months during 1566–1568. Archaeologists believe that the Spaniards at the post passed along infectious diseases such as smallpox to the local Native American population. These diseases eventually decimated the local Indian population.

Much of the information on the fort and its garrison was derived from the journal of Juan de la Vandera, who was a scribe on the Pardo expedition. In addition, artifacts discovered on the site include examples of Spanish pottery and molten lead shot. Members of Warren Wilson College and the South Carolina Institute of Archaeology and Anthropology are currently examining the site.

Fort San Mateo (Florida)

Spanish-held redoubt erected by the French as Fort Caroline and located at Beacon Hills on the St. Johns River near present-day Jacksonville, Florida. The Spanish captured Fort Caroline and renamed it Fort San Mateo in 1565. It was intended to protect the region north of St. Augustine. Based on 16th-century drawings, Fort San Mateo was a large, triangular-shaped, palisaded structure replete with five-foot earthen embankments and a moat. The original site was washed away in an 1880 flood.

At first European contact, the Timucuan peoples occupied the St. Johns River area. Spanish expeditions by Juan Ponce de León (1513), Hernando de Soto (1539–1542), and Tristán de Luna (1559) failed to permanently colonize the area. However, the French did so under Huguenot leaders Jean Ribault in 1562 and René Goulaine de Laudonnière in 1564. It was Laudonnière who established Fort Caroline.

Spain's response to the French encroachments was swift. Commanding five ships from Puerto Rico, Pedro Menéndez de Avilés arrived at Fort Caroline in 1565, just as Ribault was returning to supply the starving French. Ribualt's fleet succumbed to a hurricane, and Menéndez established St. Augustine to the south on September 8, 1565. The Spanish also captured Fort Caroline, killing all of its inhabitants. France recaptured Fort San Mateo in April 1568, slaughtering all the Spanish inhabitants. The Spanish used the opportunity to rebuild Fort San Mateo closer to St. Augustine.

The presence of Fort San Mateo failed to deter English attacks on St. Augustine in 1586, 1702, and 1740. Turned over by the Spanish to England in 1763, the post reverted to Spain in 1783 before being ceded to the United States in 1821.

Fort Saraghtoga (New York)

Short-lived British fort built in 1704, located in Washington County on the site of present-day Easton, New York. The fort was situated on the east side of the Hudson River, directly across from Fort Saratoga. The British constructed Fort Saraghtoga to protect the military road to Fort Edward (also known as Fort Nicholson) during Queen Anne's War (1702–1713).

The fort measured 150 feet by 140 feet and was built to accommodate a garrison of 450 men. Reportedly it was armed with six 12-pounder and six 18-pounder cannon. Fort Saraghtoga was demolished at the conclusion of Queen Anne's War in 1713 and was never rebuilt.

Fort Saratoga (New York)

British military post erected in 1702 on Fish Creek, south of Schuylerville in New York. Fort Saratoga was originally built as a supply and military depot, replacing Fort Vroomen, which had been built by Bartolomeus Vroomen in 1689 and razed by the French in 1695. Fort Saratoga was later rebuilt by Philip Livingston in 1721. Livingston's post was a palisaded, square-shaped structure and contained a blockhouse equipped with several cannon. Manned chiefly by militiamen, the garrison was an important military post facing north, following the failed invasions of Canada during Queen Anne's War (1702–1713). Fort Saratoga was substantially rebuilt and refurbished in 1739, but was destroyed by the French and their Native American allies of the Abenaki and Caughnawaga tribes in 1745 during King George's War (1744–1748). The attack killed more than 30 British inhabitants.

In 1746, the British rebuilt the fort and renamed it Fort Clinton, after New York's Gov. Charles Clinton. This fort was twice as large as the one it replaced and included large storehouses and 12 cannon. Its garrison numbered some 300 men.

Native Americans made several attempts to destroy Fort Clinton, and in 1747 an expedition by the French and their native allies

set out to crush both Fort St. Frederic and Fort Clinton. On June 30, 1747, the French and natives attacked the garrison at Fort Clinton, resulting in the scalping of 45 of the defenders. Later that same year, the British dismantled and burned the fort.

Fort Clinton was later rebuilt in 1757 and renamed Fort Hardy, after Gov. Charles Hardy. This installation served as the location of Major General John Burgoyne's surrender following the pivotal Battle of Saratoga in 1777 during the American Revolutionary War (1775–1783). Fort Hardy was quite large, covering some 15 acres, and featured two large barracks and three storehouses.

Fort Sault Ste. Marie (Michigan)

French garrison constructed between 1750 and 1752 by Louis Legardeur, Chevalier de Repentigny, on the south shore of the St. Mary's River, where he and Captain Louis de Bonne de Missègle had been granted a seigneury. Fort Sault Ste. Marie's location was designed to hinder Ojibwa communication with the English, reinforce the French presence in the region, and protect the fur trade in the upper Great Lakes. When finished, the fort was approximately 110 feet square with 12- to 15-foot high pickets and three interior buildings. The post, also known as Fort Repentigny, was garrisoned by a small number of Troupes de la Marine during the 1750s.

The fort's most important role was as a staging area for France's American Indian allies. Outside the pickets, Repentigny granted a small farm to Jean-Baptiste Cadotte that, with the labor of enslaved Native Americans, would produce corn for the military and native trade. With the fall of New France, British troops occupied the fort in 1762. It was abandoned after a fire destroyed a portion of the stockade and provisions in the late fall of 1762, forcing British troops to withdraw to Fort Michilimackinac. After its abandonment Cadotte removed the stockade and occupied its buildings. In 1821 the U.S. military constructed Fort Brady on the grounds of the former Fort Sault Ste. Marie.

Fort Saybrook (Connecticut)

English garrison built in 1636, located at the mouth of the Connecticut River on Long Island Sound. Late in 1635 Fitz-John Winthrop, son of the Massachusetts governor, sent an advance party to the mouth of the Connecticut River. There they were to begin building a settlement at once in order to forestall Dutch intentions to settle the area. A group of Puritan investors, whom Winthrop had met in England, appointed him to establish and govern a new colony that was to be independent of the Massachusetts Bay Colony.

Winthrop's men landed at a site on the river's west bank—called Kievet's Hook by the Dutch—and promptly tore down a sign bearing a Dutch coat of arms that claimed the area for New Netherland. Winthrop himself sailed from Boston in March 1636 to supervise construction of the new settlement and its fortification. Accompanying him was Lieutenant Lion Gardiner, an English mil-

itary engineer trained in the Netherlands, who was to design, build, and then assume command of the fort. The new settlement and fort was named Saybrook after two of the colony's investors, Lord Say and Sele, and Lord Brook. Fort Saybrook came to play a leading role in the tangled native-English affairs of southern New England. Indeed, it became a clearinghouse for information, a venue for negotiations, and a rallying point for New England troops.

During the Pequot War of 1636–1638 the Pequots attacked Fort Saybrook in September 1636 and kept it in a state of siege until April 1637, picking off anyone outside the fortifications. And they killed, captured, and tortured men who ventured from the fort to harvest crops. In April, the fort received reinforcements from Massachusetts, and the Pequots shifted their attacks to more vulnerable areas. The Pequots continued to harass the garrison, however, paddling past the fort and taunting the occupants by displaying clothing taken from English victims.

The fort was a focal point of the war against the Pequots. Shortly after Connecticut's May 1637 declaration of war, Captain John Mason assembled his recruits at Fort Saybrook. From there they advanced on their objective, the Pequot village on the Mystic River, and they reassembled at the fort after the attack. At the same time, natives wishing to ally themselves with the English came to the fort

Sir Edmund Andros, royal governor of New York, arriving at Saybrook in an unsuccessful attempt to take control of Connecticut in 1675. (North Wind Picture Archives)

to offer their support. Gardiner demanded that they demonstrate their loyalty by presenting proof that they were killing Pequots. The warriors complied by returning to the post bearing severed Pequot heads as well as living captives.

In 1645, Captain John Mason assumed command of the fort. The original fort burned down in 1647, but within a year the colonists had built a replacement fort nearby. Nearly 30 years later, Sir Edmund Andros, royal governor of New York, claimed that New York rightfully included western Connecticut and extended to the Connecticut River. Believing that Connecticut was vulnerable to threats while it prepared for another war with Native Americans, Andros seized the opportunity to press home his point. Thus, on July 8, 1675, Andros arrived at Fort Saybrook with two shiploads of soldiers. Connecticut's governor, however, had anticipated the expedition and fully manned the fort, leaving Andros little choice but to withdraw. Although Connecticut restored the fort at the beginning of the American Revolutionary War, it saw no further military action.

Fort Seybert (West Virginia)

British post built between 1755 and 1757 on the south fork of the southern branch of the Potomac River, roughly 12 miles northeast of modern-day Franklin, West Virginia. At the time, the fort was on Virginia territory. Fort Seybert was one of a line of forts intended to protect Virginia's northwestern frontier from Native American raiding parties during the French and Indian War (1754–1763). Colonel George Washington supervised the construction of the forts. Local settlers built Fort Seybert, which consisted of several log buildings forming a hollow square. The fort was named after prominent landowner Jacob Seybert, who led the colonists as captain of the local militia.

On April 28, 1758, a war party of Shawnees attacked Fort Seybert. Although they had destroyed neighboring Fort Upper Tract several days previously, the local inhabitants were unaware that the Shawnees were nearby. Many of the men, accompanied by women

and children, had crossed Shenandoah Mountain the day before, fetching supplies from the eastern settlements. Many of the remaining families had moved into Fort Seybert for greater protection during the party's absence. The first intimation of an attack was the sound of gunfire, when natives killed or captured those outside the fort.

Approximately 30 people were trapped inside the fort. The native leader, Killbuck, offered to let the settlers go. He insisted, however, that they surrender and turn over any money and goods. Despite his son's objections, Seybert agreed and opened the gates. When the people emerged, Killbuck struck down Seybert. The Shawnees killed and scalped the aged and weak, totaling 20 people. Ten others were forced to accompany the Shawnees back to their village, near present-day Chillecothe, Ohio.

Before they departed, the Shawnees set Fort Seybert afire. One man who had hidden inside the fort managed to escape and spread the story among the other settlers. The destruction of Fort Seybert and continued raids by natives forced the Virginia Assembly to replace the fort with one supported by public funds. Fort Seybert was later rebuilt and became the site of a small town.

Fort Shantok (Connecticut)

Native American fort erected around 1636 that enclosed the main Mohegan village located on the west bank of the Thames River, in modern-day New London County, Connecticut. Fort Shantok's strategic location allowed the Mohegan sachem Uncas to control people of other tribes that joined the Mohegans. It also served as a major trading post with the English and as a production center for wampum.

An earlier Native American fort had been located at the same site. However, the Mohegans had used it only in times of war. Fort Shantok included a village surrounded by palisaded walls. As with other Native American fortifications, the walls consisted of logs placed upright in the ground. The lower three feet were buried, and another 10 to 12 feet stood above ground.

Loopholes provided the means to shoot arrows, and later firearms, at attackers. Fort Shantok was roughly rectangular in shape, with sides measuring 600 feet by 300 feet. The fort's site on a raised promontory between Shantok Creek and the Thames River helped ensure access to water and a degree of control over traffic on the waterways.

Fort Shantok was built by Uncas, the best known of Mohegan leaders. He recognized the growing power of the English colonists and sided with them against his Native American rivals. When Uncas became leader, the Mohegans numbered between 400 and 600 people. Uncas supported the English in their war against the Pequots (1636–1638). After the Pequots were virtually annihilated, Uncas received some captives as new members of the Mohegans. Members of other tribes also joined the Mohegan community. They recognized that Uncas was under the protection of the English and could provide a safe refuge.

New members of the Mohegan tribe settled in five villages located along the Thames River south of Fort Shantok. There Uncas and his loyal supporters could watch them. At different times, when Uncas was closely pressed by his rivals, English soldiers helped garrison Fort Shantok.

The most serious attack on Fort Shantok took place in the spring of 1645, when the Narragansetts attacked the Mohegans in revenge for Uncas's murder of their leader, Miantonomo. Uncas and his supporters were besieged in Fort Shantok. He then sent messengers to Fort Saybrook, requesting English aid. In July, Thomas Leffingwell and a number of Englishmen managed to secretly sail up the Thames River to Fort Shantok, carrying with them much-needed supplies. When the Narragansetts realized that they could not starve the Mohegans out, they retired to their own lands.

Fort Shantok was not only a refuge but an important part of the Mohegan economy. It was not only the center for the production of wampum but also the chief site through which English trade goods flowed to natives in the region. Trade in weapons was especially important for Uncas. The domestic activities at Fort Shantok have provided much information about life and culture of the Native Americans in the region. During the 20th century, archaeologists excavated much of Fort Shantok to learn how interaction with Europeans affected local culture.

The Mohegans abandoned Fort Shantok after Uncas's death in 1684. Although it was later reoccupied by the Mohegans, the loss of their sovereignty caused the fort to be abandoned once more. It now forms part of Fort Shantok State Park.

Fort Shirley (Massachusetts)

British fort built in 1744 during King George's War (1744–1748) and located in western Massachusetts near present-day Heath in

Franklin County. Fort Shirley was one of a line of four forts built during King George's War to defend Massachusetts settlements between the New York border and the Connecticut River. The three other redoubts were Fort at Number Four, Fort Massachusetts, and Fort Pelham.

By the time war officially began between France and Great Britain in March 1744, Massachusetts authorities were aware that settlements in the western part of the colony were vulnerable to native raids. Private individuals had already erected fortified houses at their own expense. However, these extemporized forts were not very effective in stopping raiding parties. Thus Massachusetts's Gov. William Shirley ordered the construction of a line of forts at public expense. The first fort to be built was Fort Shirley. On July 20, 1744, Shirley ordered Captain William Williams to construct the fort according to specific directions.

Williams duly constructed an enclosure 60 feet square from local white pine. Logs were hewn 6 inches thick and 14 inches high. Workers then laid them on top of each other to form walls 12 feet high. Oak dowel pins secured each course of logs to the one below. The corners were dovetailed together for greater strength. At two of the corners stood towers 12 feet square and 7 feet high. Buildings within the walls provided barracks and storage space. Workmen dug a well inside one corner of the enclosure to ensure fresh water in the event of a siege. Construction occurred during the period of August to October 1744.

Williams officially took command of Fort Shirley on October 30, 1744, with a garrison of the Massachusetts Militia. Around March 1, 1745, he sent 14 of his men to Boston to take part in the Louisbourg Expedition. Later that spring, Williams took 74 soldiers from the Connecticut River Valley to Louisbourg as reinforcements. At that point, Captain Ephraim Williams replaced him as commander of Fort Shirley. By the fall of 1745, Ephraim Williams had become commander of the line of forts in the region.

Although Fort Massachusetts served as regional headquarters for a time, its destruction in August 1746 meant that command returned to Fort Shirley. Approximately 350 men manned the forts. For greater security, groups of soldiers patrolled between the forts.

To provide for the soldiers' spiritual well-being, Rev. John Norton served as chaplain to the garrisons. He made Fort Shirley his base and ministered in other forts as needed. When Norton was captured at the fall of Fort Massachusetts, his wife and children remained for a year at Fort Shirley.

Following the Peace of Aix-la-Chapelle in 1748, the garrison at Fort Shirley was reduced. By 1752, a single caretaker, paid by the Massachusetts treasury, maintained the fort. British authorities recognized that the fort's location failed to block the French and their native allies in their raids, and it was therefore abandoned after 1754.

Fort Shirley (Pennsylvania)

British post built in 1755 at the site of Indian trader George Croghan's home and trading post, along the Aughwick Creek and near the junction with the Juniata River in Pennsylvania. Fort Shirley was the most westerly fort built by the colony of Pennsylvania at the time of the French and Indian War (1754–1763). It was to serve two purposes. First, it was to provide a defense for the settlers west of the Susquehanna River. Second, it was designed to block French and native raiding parties from attacking eastern Pennsylvania.

Croghan, who had lived in the frontier region since 1742 and was well known to both natives and colonists, built Fort Shirley. He had located his trading post on one of the main routes to eastern Pennsylvania, to serve as a clearing house for products from both east and west. During the 1750s, French expansion into the Ohio River Valley reduced Croghan's trade and led to increasing tensions between English settlers and natives. Croghan thus fortified his trading post and recruited a small company of about 40 men to defend his property.

The failed expeditions of Colonel George Washington in 1754 and Major General Edward Braddock in 1755, however, laid the Pennsylvania frontier open to attack. They also convinced many tribes to turn against the English. Croghan began building a stockade around his trading post in October 1755 for greater security. When Pennsylvania officials authorized defensive measures for the frontier, they consulted Croghan. In December 1755, they commissioned Croghan a captain and charged him with organizing the colony's western defenses.

Croghan's fortified trading post became Fort Shirley, named after Massachusetts governor and British major general William Shirley, commander in chief in North America following Braddock's death. Croghan selected sites for and built three more forts. These were to form a defensive line with Fort Shirley and provide safety for settlers on the frontier. Croghan enlisted 300 men to provide 75-man garrisons for each fort. He became commander of Fort Shirley, then the most westerly point in the defenses.

Shortages of weapons, supplies, and sporadic pay plagued the garrison at Fort Shirley. Croghan repeatedly asked the government for money, complaining that his best men were leaving because they were not being paid. Hostile natives routinely prowled outside the fort and captured a number of unwary soldiers and settlers. Worse

yet, native raiding parties bypassed the small garrison and struck at settlements farther east.

Croghan resigned his commission in March 1756. Captain Hugh Mercer replaced him as commander on March 6. Eventually, Croghan received payment for his property.

Mercer also complained of recruitment problems for his company. On May 11, 1756, the garrison became one of seven companies in the 2nd Battalion of the Pennsylvania Regiment, under the command of Lieutenant Colonel John Armstrong. Following the capture and burning of nearby Fort Granville by Delaware warriors, Armstrong prepared secret plans to retaliate against their main settlement at Kittanning on the Allegheny River. Supplies were gathered at Fort Shirley for the expedition. In late August 1756, 300 men from all seven of Armstrong's companies gathered at Fort Shirley.

On August 29, the advance force departed, followed by the main force the following day. Before leaving, Armstrong had the gates to Fort Shirley removed, effectively making it untenable. Following the Battle of Kittanning on September 8, most of Armstrong's party returned to Fort Lyttelton.

In October, Gov. William Denny toured the western defenses. Acknowledging that Fort Shirley was too isolated to resist a French and native attack, Denny ordered it destroyed and the garrison transferred to Fort Morris at Shippensburg. The town of Shirleysburg was later established at the site of the former fort.

Fort St. Andrews (Georgia)

British fort established by Georgia leader James Oglethorpe on April 18, 1736, at the northern tip of Cumberland Island to provide for defense of the Frederica and Darien settlements along the Georgia coast. Naming the fort for the patron saint of Scotland, Oglethorpe himself established the outline of the fort on a high neck of land overlooking the Inland Passage, today known as Terrapin Point. He charged Captain Hugh Mackay with the construction of the fort, for which he employed more than 30 Scottish Highland indentured servants and 10 rangers.

Fort St. Andrews was designed in a star shape with four points that served as bastions. The northern points were shorter than the two southern points, and the inside dimension of the fort was about 65 by 130 feet. It was constructed using frames made of double walls

of timber that were then filled with sand to provide a solid defense against cannon fire. A palisade of logs was placed into a moat where natural springs provided fresh water. A single-story frame house was situated inside with a powder magazine and storehouse in the cellar below. Below the fort, another small, triangular earthen battery was built in which to mount cannons to protect English river traffic on the Inland Passage.

Fort St. Andrews played an important role in the complex system of defenses Oglethorpe established to protect Georgia from Spanish invasion. The fort saw much military activity, including a short mutiny on the part of disgruntled troops that was put down by Oglethorpe himself, who demonstrated personal courage and leadership during the incident.

In June 1742, Spanish governor Juan Francisco de Güemes ordered Manuel de Montiano to attack English settlements on St. Simons Island. They arrived with a fleet of 52 ships and almost 2,000 men. During the course of the invasion, Oglethorpe abandoned Fort St. Andrews so he could better consolidate his troops for the defense of St. Simons. However, the fort was evacuated so quickly that several cannon were left behind as well as more than 50 horses held in a corral.

After the defeat of the Spanish in the Battle of Bloody Marsh, they retreated down the Inland Passage back toward St. Augustine. On July 15, 1742, they moved their forces from the southern end of

Jekyll Island to Cumberland Island. There they destroyed Fort St. Andrews and killed the horses.

Following the repulse of the Spanish, Oglethorpe made no attempt to rebuild Fort St. Andrews. The location later served as a temporary post for Highland Rangers through 1744.

Fort Stanwix (New York)

British fortification constructed beginning in 1758, located at the headwaters of the Mohawk River, near modern-day Rome, New York. Fort Stanwix was crucial in British colonel John Bradstreet's 1758 expedition against the French-held Fort Frontenac. The post protected the portage between the Mohawk River and Wood Creek,

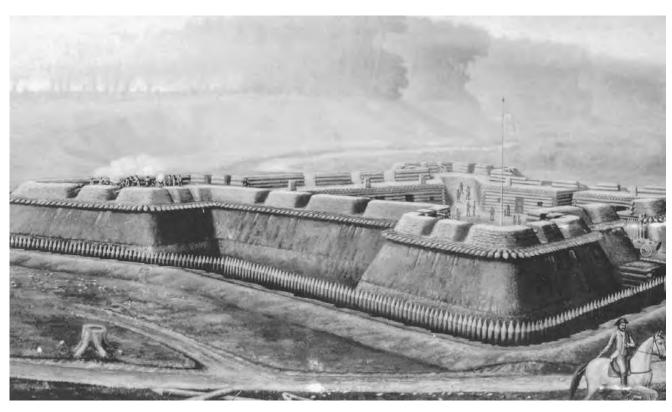

Illustration depicting Fort Stanwix, New York. Located at the head of the Mohawk River and constructed by the British beginning in 1758, it played a prominent role in the American Revolutionary War. (The Granger Collection, New York)

and because Wood Creek connected to Lake Ontario by way of Lake Oneida and the Oswego River, this entire route was an important avenue of approach for French forces attacking the New York frontier or for British forces moving against Lake Ontario. During the American Revolutionary War, the rebel garrison at Fort Stanwix stopped British lieutenant colonel Barry St. Leger's 1777 expedition, which was to link up with that of Major General John Burgoyne at Albany.

The British had constructed a series of fortifications to protect the Mohawk River–Wood Creek portage in 1755 to support Gov. William Shirley's abortive expedition against Fort Niagara. The next year, when French forces under Louis-Joseph, Marquis de Montcalm, destroyed the British Oswego forts on Lake Ontario (approximately 50 miles west of the portage), the British abandoned the portage forts. In 1758, as Bradstreet moved on Fort Frontenac, the British reoccupied the portage, building several forts to include Fort Stanwix. Named for Brigadier General John Stanwix, who technically commanded the Bradstreet expedition, the fort was a formidable work. Although constructed of earth and wood, it was of European design, complete with angled bastions, dry moat, and outworks.

In addition to the fort's significant role in the American Revolutionary War, it was also the site of the 1768 Treaty of Fort Stanwix. This agreement saw Sir William Johnson successfully negotiate the ceding of Native American lands south and east of the Ohio River to Great Britain. Fort Stanwix caught fire and was destroyed in 1781.

Fort St. Charles (Minnesota)

French outpost constructed in 1732 at the top of the Northwest Angle in Angle Inlet of Lake of the Woods in present-day Minnesota. It was the second in a chain of French forts in the region and, when built, was the most northwesterly French settlement in North America.

Fort St. Charles was constructed in 1732 on the orders of enterprising French Canadian fur trader and explorer Pierre Gaultier de Varennes, Sieur de La Vérendrye. The fort was built by his nephew, Christopher Dufrost de La Jemeraye, and the eldest of four sons, Jean-Baptiste de La Vérendrye. The fort soon became the focal point for the French fur trade and exploration in the West. Its location served to divert the Native American fur trade away from the British posts on Hudson's Bay.

Fort St. Charles consisted of a palisade made of a double row of cedar posts 100 feet long and 60 feet wide. In the enclosure were a chapel, houses for the commandant and missionaries, quarters for soldiers, a warehouse, and a powder magazine. Gates were located at the north and south ends of the structure.

Using Fort St. Charles as his principal base, La Vérendrye and his sons explored much of present-day Manitoba and into Saskatchewan. They also traveled to the Great Plains and explored the upper Mississippi River. They were also the first white men to reach the foothills of the Big Horn Mountains of northern Wyoming.

In 1736, 19 *voyageurs* from the fort, led by Jean-Baptiste de La Vérendrye, departed for Fort Michilimackinac for supplies. The party met with a grim end. A group of natives massacred them on an island in the Lake of the Woods, but their remains were later recovered and taken back to Fort St. Charles and buried beneath the fort's chapel. The discovery of these remains helped determine the fort's exact location later.

In 1742, two of La Vérendrye's sons again traveled west and, in a trip of more than a year's duration, explored beyond the Missouri River and reached the foothills of the Rocky Mountains. La Vérendrye was forced in 1743 to return to Montreal to pay outstanding debts, however. His sons remained at the fort, which was abandoned during the French and Indian War (1754–1763). Over the next century, nonetheless, the site figured quite conspicuously in the displacement of the Dakotas by the Ojibwas in Minnesota and North Dakota. An archaeological dig in 1908 unearthed remnants of the fort, which was reconstructed in 1950. It is on Magnussen's Island at the mouth of Angle Inlet. The location became an island following the raising of lake levels. The fort is included in the National Register of Historic Places.

Fort St. Frédéric (New York)

French fortification constructed from 1734 to 1737 at the head of Lake Champlain at the site known to the British as Crown Point. Until the construction of Fort Carillon (Ticonderoga) in 1755, Fort St. Frédéric represented the southern limit of French control in the Champlain Valley. The French destroyed Fort St. Frédéric in 1759, during the French and Indian War (1754–1763) to prevent its seizure by the British.

At Crown Point, Lake Champlain narrows significantly, making the site ideal for controlling movement on the lake. The French first took advantage of this strategic location in 1731, when they constructed a log stockade on the eastern shore.

The French soon realized, however, the need for more permanent works and began construction of a stone fortification on the lake's western shore. Initial plans called for a single, four-story tower or redoubt, octagonal in shape and with openings in the floor of projecting parapets to protect the tower's base. Very quickly, this tower became part of a larger, European-style, angled-bastion fortress, complete with dry moat and light artillery.

Although well designed, Fort St. Frédéric suffered from deficiencies in location and construction. Louis Antoine de Bougainville noted in 1756 that Fort St. Frédéric was "badly located, there being several heights which command it." Additionally, although Crown Point commanded the lake, the French had failed to build the fort where it could best observe ships approaching from the south. In 1739, they constructed a redoubt to the east to rectify this problem. By the early 1750s the fort's walls had deteriorated and were in need of significant repairs. Given these shortcomings, the French shifted their focus on Lake Champlain southward to Fort Carillon.

During King George's War (1744–1748) and the French and Indian War, Fort St. Frédéric acted as a staging area for raids against the British colonies of New York and New England. In 1755, British major general William Johnson led a combined expedition of provincials and Native Americans in a planned attack against the fort. He reached the southern end of Lake George where he defeated the French on September 8, 1755, but stopped to build Fort William Henry instead of continuing the operation.

Although Fort St. Frédéric became less significant with the construction of Fort Carillon beginning in October 1755, provincial rangers continued to conduct raids and reconnaissance missions against the French garrison from there. When Major General Jeffery Amherst forced the French to abandon and destroy Fort Carillon in 1759, they retreated to Fort St. Frédéric, then blew it up. This ended French occupation of the area. In 1760, the British refortified Crown Point and garrisoned it until 1773.

Fort St. George's (Maine)

English post constructed about 1719 along the St. George River in Maine (then part of Massachusetts), now the present-day site of Thomaston, Maine. English settlers first settled on lands along the St. George River around 1719. The settlement was the easternmost English outpost in Maine, and threatened both Abenaki and French interests.

To protect the settlers, the colony of Massachusetts built two blockhouses and enclosed them with a palisade wall. A covered walkway ran from the blockhouses to the river, permitting the safe arrival of reinforcements during a siege. Authorities expected attacks on Fort St. George's because it provided the first English military presence on Penobscot Bay.

In 1722, at the beginning of Dummer's War (1722–1727), the Abenakis made Fort St. George's one of their first targets. On June 12, 1722, a native war party attacked the post. The Abenakis captured a sloop and burned it; they also took several citizens hostage. The garrison and the raiders exchanged fire, but the warriors soon left with their captives. Two months later, another group of Abenakis attacked St. George's. They killed 5 settlers and besieged the blockhouses for 12 days. The natives eventually gave up and returned home. About 60 Abenakis again attacked the fort on December 25, 1723. They surprised 2 provincial soldiers outside the walls and learned about conditions within the fort. The outnumbered garrison managed to withstand a 30-day siege, however, thanks mostly to the will of its commander. A relief force under Colonel Thomas Westbrook finally arrived and the Abenakis departed. An Abenaki attempt to burn the fort in 1724 failed when the garrison extinguished boats loaded with combustible materials.

In 1725, John Gyles took command of Fort St. George's. He participated in many of the negotiations to end the war, which were held at the fort. A peace treaty was finally signed in 1727.

After Dummer's War, Fort St. George's became the site of a major trading post owned and operated by Massachusetts. The Abenakis brought in furs and received tools, weapons, and other goods in exchange. An armorer employed by the colony repaired Native American guns. Private traders protested the threat to their profits, but the post provided honest exchanges and refused to sell hard liquor to the natives. The colonial government also recognized

the continuing military importance of Fort St. George's and added another blockhouse to the fortifications.

The added blockhouse proved useful during King George's War (1744–1748). On July 19, 1744, a combined French and Native American raiding party attacked St. George's. Most buildings outside the fort were burned, but the local population remained safely inside. In September 1747 the French and natives again attacked Fort St. George's. In an unusual move, they undertook regular siege operations. The besiegers tried tunneling under the walls while keeping the blockhouses under sporadic fire. Heavy rains, however, caused the tunnels to collapse, bringing the siege to an end.

The Abenakis and the French launched two more serious assaults on Fort St. George's during the French and Indian War (1754–1763). The first came in 1755, but it had little effect. The second was in August 1758, when a 400-man raiding party of Abenakis, led by French officers, attacked Fort St. George's. Early intelligence about French plans, however, permitted the garrison to be reinforced and the assault failed. As the war wound down, the threat from the Abenakis and the French declined. Fort St. George's was abandoned in 1762.

Fort St. Inigoes (Maryland)

English fort built in 1644 near the mouth of St. Inigoe's Creek, approximately three miles south of St. Mary's City, Maryland. In the late 1620s, the Calvert family arranged with the English Crown to establish a colonial refuge for loyal Catholics. In 1633, one group of Catholics departed for North America in an expedition of two ships, the *Ark* and the *Dove*. They originally settled on St. Clement's Island, near the mouth of the Potomac River. In defending their settlement, they relied on the help of nearby Fort St. Mary's.

The settlement soon expanded, however, and Fort St. Mary's fell into disrepair. The settlers then erected a new fortification at Fort Point, at the junction of the St. Mary's River and St. Inigoe's Creek. This post became known as Fort St. Ignatius, also known as Fort St. Inigoes.

Fort St. Inigoes served to defend the expanding settlement of English Catholics, including the St. Ignatius Church, founded in 1641 by Jesuit Father Andrew White. This fort, like many others on the early colonial American frontier, served not only as a defense against attack by the natives, but it also served as a point of contact with the Jesuits' new neighbors. In particular, it functioned as a bastion of Catholicism in what was then the American wilderness (entirely Protestant). Pastors routinely performed conversions and heard confessions in a wide area, from Virginia to Pennsylvania.

As with its predecessor, Fort St. Inigoes appears never to have been attacked. In the 1650s it fell into disrepair in its turn. The church continued its work, however, and the Jesuit community expanded along the lower Potomac. Today, St. Ignatius Church claims to be the oldest continuous Jesuit establishment in North America.

Fort St. Joseph (Michigan)

French post first built in 1691 on the St. Joseph River, near present-day Niles, Michigan. The French established a Jesuit mission on the site to strengthen their ties with the Miami tribe. This outpost was located along the Great Sauk Trail, the principal trading route from the Great Lakes to the upper Mississippi Valley. In 1697, the Marquis de Denonville, governor-general of New France, ordered that a trading post and fortification be built there to support the mission. He named the collective establishment Fort St. Joseph. The fort was situated on a bluff above the river and commanded the portage between the St. Joseph River and Kankakee River. It was also located between the villages of the Miamis on the right bank of the river and the Potawatomis on the left bank. Because of these factors, Fort St. Joseph became an important rendezvous point for native and French fur traders.

A small group of French soldiers under the supervision of Ensign Augustin Legardeur de Courtemanche constructed Fort St. Joseph near the Jesuit mission. It began as a crude palisaded enclosure with a few iron cannon. Over the years, the French continued to improve and renovate the facility, which became a keystone for French influence in the region.

In October 1761 during the French and Indian War (1754–1763), British ensign Francis Schlosser led a detachment of 14 soldiers of the 60th Royal American Regiment to garrison the post, which had been ceded by the French. The British presence disturbed the balanced relationship established by the French and native inhabitants at Fort St. Joseph. Schlosser's high-handed poli-

cies also did not help matters. This youthful commander alienated the French and particularly the Potawatomis.

Native enmity was demonstrated on May 25, 1763, when Fort St. Joseph became a major target of Pontiac's Rebellion (1763). A delegation of Detroit Potawatomis had arrived to visit those in the village near the fort. Schlosser, not knowing the war had already begun at Detroit, allowed the delegation admittance to the fort. Once the delegation was inside, other Native Americans rushed through the gate and killed 11 of the garrison before Schlosser could react. Schlosser was taken captive along with 3 other men who were all taken to Detroit. They were later exchanged for some Potawatomi prisoners.

The fate of Fort St. Joseph was shared by at least seven other British outposts that had been captured using a ruse and coup de main to eject British influence from the Northwest. The British did not assign a garrison to the fort again. Fort St. Joseph would later be the scene of activity during the American Revolutionary War, including a raid by the Spanish from St. Louis, who successfully captured the post from the British and held it until the end of the war.

Fort St. Leon (Lousiana)

See English Bend (Louisiana)

Fort St. Louis (Texas)

French fort established in 1685 by the French explorer René-Robert Cavelier, Sieur de La Salle, on the Texas coast. The post was situated on the west bank of Garcitas Creek (modern-day Victoria County, Texas), a tributary of Matagorda Bay.

Originally, La Salle had no intention of building a fort at that location. Instead, he hoped to establish a line of forts along the Mississippi River as staging areas from which to invade New Spain. The French organized an expedition with 280 colonists, including 100 soldiers to establish the forts on the Mississippi. Misfortune and poor maps, however, caused the expedition to miss the river by 400 miles. It made landfall at Matagorda Bay, in Spanish territory. The colonists encamped on Matagorda Island while La Salle searched for a more secure location inland. There he ordered the construction of Fort St. Louis. Little is known about the physical structures of the post other than the fact that they were made mostly of wood.

La Salle and his colonists found themselves in difficulty when their supply ship *Belle* became stranded on a sandbar and sank. Disease, fatigue, and desertions added to their problems. Because La Salle overworked the colonists, their numbers were reduced by half in a matter of months, from both illness and defections. With most of Fort St. Louis complete, La Salle, believing they were not far from French Louisiana, began to explore the surrounding area to find French settlements. His last expedition, an attempt to find the distant French forts in the Great Lakes region, began in early 1687 and ended with his death at the hands of his disgruntled men.

Fort St. Louis soon fell prey to raids against it by the Karankawa tribe in late 1688 or early 1689. The Karankawas killed all of the colonists except for five children, whom they adopted. The Spanish rescued them several years later.

Fort St. Louis fell into ruin and was probably razed by the Spanish in 1690. In 1721, the Spanish built Presidio Nuestra Señora de Loreto de la Bahia on its remains.

Fort St. Louis at Pimiteoui (Illinois)

French fort constructed in 1691–1692 on the northwestern shore of Lake Peoria (Pimiteoui) above where the lake empties into the Illinois River. The last of three 17th-century forts built by the French in Illinois Country, Fort St. Louis at Pimiteoui was also known as Fort Pimiteoui, Fort Illinois, Fort Peoria, and Fort St. Louis Number 2.

The post's site was not far from the site of Fort Crèvecoeur, built by René-Robert Cavelier, Sieur de La Salle, in January 1680. That redoubt was destroyed within the year by deserting employees. La Salle's associates, Henri de Tonti and François La Forest, built Fort St. Louis at Pimiteoui during the winter of 1691–1692. The two had previously supervised the construction of Fort St. Louis at Starved Rock in 1682. However, that site eventually proved undesirable because of hostility from the Fox and Iroquois tribes and depletion of firewood and game.

Tonti and La Forest consulted with the Illinois about a suitable building place, and the chiefs chose the lower end of the lake. Tonti gained authority to transfer the concession of Fort Crèvecoeur after

La Salle's death, and he and La Forest were thus able to proceed with the move.

As with its predecessor, Fort St. Louis at Pimiteoui was named after King Louis XIV. The fort's defenses consisted of a square wooden palisade with bastions in each corner. Within the walls were a number of log buildings used for stores and barracks. In April 1693, Jesuit Father Jacques Gravier reestablished the Mission of the Immaculate Conception just outside the fort's walls.

In 1702, Tonti and La Forest lost their concession because of new trade restrictions. As a result, French fur traders abandoned Fort St. Louis. Still, trading continued, with Tonti's nephew remaining in the area until 1711.

In 1717, the territory was transferred from New France to Louisiana, but this had little effect on the fort's operations. Fort St. Louis retained some military importance and maintained a small but temporary garrison. There are no records of skirmishes during the French and Indian War (1754–1763). After the French defeat in the war, Fort St. Louis passed into English possession. When the British arrived in the area, they found a layout fairly similar to the original structure. By 1773, however, the stockade had been destroyed by fire. By 1826, all that remained of the fort were burned pickets and heaped earth.

Fort St. Louis at Starved Rock (Illinois)

French garrison built in 1683 overlooking the Illinois River, not far from modern-day Utica, Illinois. Starved Rock is a 125-foot-high sandstone cliff and the most prominent geographical feature on the Illinois River. Early French explorers of the region named this landmark "La Roche" (The Rock). The Rock, as it was often referred to on contemporary maps, possessed a natural value as a highly defensible point. The French and various Native American groups made use of it as a bastion at different times.

In the 1680s, French explorer René-Robert Cavelier, Sieur de La Salle, selected the high point on the Illinois River as the site for a fort, named St. Louis. La Salle assigned Henri de Tonti the task of constructing the fort, which was completed in 1683. The structure Tonti erected consisted of an irregularly shaped wooden palisade with 22-foot-high walls where the cliff sloped downward and 15-foot walls facing the river. There was also a chapel, a warehouse or magazine, and several other smaller buildings designed for housing and to facilitate trade transactions. Because it was built atop a promontory, the fort was virtually impregnable on three sides, with

the fourth approachable only by a narrow, winding path. For several years, Fort St. Louis played an important role in the French trade network up and down the Illinois River. This was not a permanent state of affairs, however, and the French abandoned the fort in 1691 for a new fort farther downstream.

Throughout the 18th century, various Native American tribes used the site of the abandoned French fort as a defensive bastion in times of need. Reportedly, one such occasion in the early 1770s gave Fort St. Louis and vicinity its other name of Starved Rock. Apparently, a party of Potawatomi warriors pursued a group of the Illinois tribe to the site. The reason for the pursuit was the belief among the Potawatomis that the Illinois were responsible for the murder of the native leader Pontiac after the failure of his uprising in 1763. In desperation, the Illinois entered the old fort, seeking protection from their adversaries, and were there besieged. During the siege, the Illinois used buckets attached to a cord to try to secure water, but the Potawatomis cut the cords. After days of siege, the Potawatomis overcame the starving Illinois and killed them. Most 21st-century historians view this account as legend rather than fact.

Fort St. Peter (Mississippi)

French fort built about 1714 on bluffs above the Mississippi River, near Vicksburg, Mississippi. The French erected Fort St. Peter as part of a defensive cordon against English expansion in North America. The fort also functioned as a trading post. Fort St. Peter's location by the Mississippi was strategic by water but indefensible by land. Little is known of the structure's physical description other than the fact that it was palisaded.

During the Natchez War (1729–1733), on January 2, 1730, the Yazoos ambushed and then massacred the 20-man French garrison at Fort St. Peter. After Spain took control of the area by treaty in 1763, the Spanish built nearby Fort Nogales in 1783 to replace aging Fort St. Peter. The two forts were taken by U.S. troops in 1798 and renamed Fort McHenry before the 1803 Louisiana Purchase.

Fort St. Simons (Georgia)

British fortification built in 1738 on the order of Georgia's founder, James Oglethorpe, on the southernmost point of St. Simons Island. The garrison was designed to guard coastal Georgia from Spanish attacks and was crucial in reinforcing English colonial claims and interests in Georgia. Fort St. Simons was within 400 yards of Fort Delegal and 6 miles from Fort Frederica. Fort St. Simons and Fort Delegal were designed to protect the sound from invaders and guard the access road to Fort Frederica. Manned by the 42nd Regiment of Foot, which alternated soldiers stationed at Fort Frederica, Fort St. Simons had cannon and trenches. Little more is known about the garrison's particulars.

On June 28, 1742, soldiers stationed at Fort St. Simons sighted 36 Spanish ships heading northward. Spanish governor Juan Francisco de Güemes had ordered Manuel de Montiano to attack St. Simons Island. By July 5, Montiano's fleet had sailed into the sound, despite resistance from the fort. Several thousand Spaniards disembarked at Gascoigne Bluff, almost two miles north of Fort St. Simons.

Oglethorpe ordered the defenders of Fort St. Simons to evacuate the fort and remove any vessels. Before they departed for Fort Frederica, the soldiers destroyed all vessels they could not bring off. Spanish troops moved south the next day and seized now-abandoned Fort St. Simons. They employed the fort as their head-quarters in planning an attack on Fort Frederica.

English forces, supported by their Yamasee allies, ultimately defeated the Spanish in ambushes on the island's military road and in the Battle of Bloody Marsh on July 7. The Spaniards then retreated to Fort St. Simons and planned two unsuccessful raids on Fort Frederica. Following these, Montiano instructed his troops to raze Fort St. Simons and depart the island. The Spanish had departed by July 15. The British never rebuilt the fort.

Fort Swanendael (Delaware)

Ill-fated Dutch outpost constructed in 1631 and located along the western coast of Delaware Bay, near modern-day Lewes, Delaware. In 1629, Gillis Hossitt, a seaman acting for a group of Dutch investors, purchased land from the Delaware people to establish New Netherland's first patroonship. Samuel Godyn was the leading investor, joined by Kiliaen van Rensselaer, Samuel Blommaert, Johannes DeLaet, David DeVries, and others. Hossitt set up a furtrading post, located on the seacoast at Lewes Creek (called Hoorn or Hoere Kill) and called the land Swanendael (or Zwaanendael in modern Dutch), meaning valley of the swans.

Hossitt returned to Amsterdam with a valuable cargo of furs while Godyn organized an expedition to settle the area. The expedition arrived in spring 1631. DeVries captained the ship *Walvis* (Whale), carrying 28 men along with trading goods, livestock, building materials, and farming and whaling equipment. The investors hoped to harvest whale oil as well as trade in furs.

Under Hossitt's supervision, the men built a brick blockhouse and cookhouse. The structures were surrounded by a four-sided wooden palisade. They called it Fort Oplandt. Five men from New Amsterdam joined them there. After the *Walvis* returned to the Netherlands, the investors planned a second expedition, also under command of DeVries.

In early 1632, a neighboring Delaware Native American removed the metal coat of arms from its stake outside the Dutch trading post. Metal was almost unknown to the natives, and the man intended to make a tobacco pipe of it. The Dutch saw this as the theft of an important symbol of authority and vigorously protested. Fearing the traders' anger, several natives executed the thief and brought his head to the trading post. The traders were reportedly distressed, having expected a less severe punishment. The dead man's friends, too, were upset, and took revenge. They approached the house supposedly bearing furs to trade and then killed the two men inside. They then approached the men working in the fields and killed them one by one. Only one man escaped.

News of the massacre made its way to the Netherlands before the second expedition sailed. The investors abandoned their plan to send more settlers and recast the voyage as a whaling expedition. Two vessels arrived off Cape Henlopen in December 1632. DeVries found the blockhouse destroyed, the skeletons of 32 men, and the bones of their horses and livestock. Even the watchdog had been shot through with 25 arrows.

DeVries saw no point in trying to find the perpetrators and take revenge. Thus, he made peace with the natives and reestablished trade. His men set up a camp on the beach, but the whaling did not go well and food supplies soon dwindled. DeVries then decided to abandon the venture at Swanendael, and in the spring of 1633 he began the return voyage to Holland. The settlement's leading shareholder, Godyn, died in September 1633, and interest in Swanendael

died with him. The investors had sold the land to the Dutch West India Company by 1635.

The existence of Fort Swanendael and its episodic occupation by the Dutch during the period 1631 to 1633 permitted the Dutch to retain title to the area when challenged by the English of Maryland. Permanent Dutch settlers eventually occupied the area around 1659.

Fort Ticonderoga (New York)

French garrison built during 1755–1756, strategically situated along the southern coast of Lake Champlain in New York on a rugged peninsula that juts into the lake from the west, narrowing the northward-flowing lake to a few hundred yards. The site overlooks the La Chute River, a short waterway that links Lake George, to the southwest, to Lake Champlain.

Since 1689, Lake Champlain had been an important military north-south water route through the northern wilderness for both the French and British and their Native American allies. English armies gathered in Albany, New York, and traveled up the Hudson River 40 miles to Fort Edward and portaged the 12 to 15 miles north-

Plan of Fort Ticonderoga and its surrounding fortifications during the American Revolutionary War. Ticonderoga, on Lake Champlain, was a key installation during the French and Indian War and the American Revolutionary War. (Library of Congress, Geography and Map Division)

ward to either Lake Champlain's source 25 miles south of Ticonderoga or down Lake George and across the 2-mile portage around the La Chute River's falls to Lake Champlain. Both routes converged at Ticonderoga. Sixty miles to the north, Lake Champlain emptied into the Richelieu River that ultimately emptied into the St. Lawrence River Valley, the heart of New France. In the 1730s, the French built Fort St. Frédéric at Crown Point, 10 miles north of Ticonderoga. But during the French and Indian War (1754–1763), a new French post at Ticonderoga, Fort Carillon, blocked that strategic junction.

After stopping Sir William Johnson's provincial army in the September 1755 Battle of Lake George, French troops directed by Michel de Lotbinière began to build a fort at Ticonderoga. Lotbinière chose a site atop a rocky finger of land running along the southern edge of the peninsula. Constructed of squared oak timber cribs filled with debris, this fort, which the French called Fort Carillon, was square shaped with four corner bastions. It reportedly mounted more than 20 cannon. Because an opponent could only attack easily from the west across the heights or move under the fort's guns across the broad plain to the north, two detached triangular bastions, known as demilunes, bolstered the western and northern walls. Three barracks built of stone could maintain at least a 400-man garrison. Gradually, the original wooden walls received a stone facing. Simultaneously, the English constructed Fort William Henry at Lake George's southern end, 30 miles to the south. Both sides continuously scouted and raided each other's installations.

The French and Indian War returned to Lake George and the Champlain Valley in 1757. In August 1757, Major General Louis-Joseph, Marquis de Montcalm, launched an offensive from Fort Carillon that captured and destroyed Fort William Henry. The following year, Major General James Abercromby led a massive, 13,000-man British force down Lake George toward Fort Carillon. Outnumbered at least three to one, Montcalm realized the fort could not withstand a siege and he ordered his men to construct a stacked log wall about 6 feet high, complete with firing steps and loopholes, across the western approaches, half a mile from the fort. Montcalm deployed the bulk of his 4,200 men along this line. Abercromby's men assaulted the French position at least six times on July 8, 1758, but the attacking British troops became entangled in abatis, the mass of sharpened tree limbs the French had arranged before their defenses. Inexplicably, Abercromby never brought up his artillery. Having sustained nearly 2,500 casualties, compared to only 400 for the defenders, Abercromby withdrew.

The next year, in July 1759, Major General Jeffery Amherst methodically moved an army of 5,800 regulars and some 5,000 provincials toward Ticonderoga. Fort Carillon's 400-man garrison under Captain Louis-Philippe Le Dossu d'Hebecourt bluffed Amherst into deploying for a siege, but then withdrew to Fort St. Frédéric just four days after the English arrival to join its strong garrison under Brigadier General François-Jean de Bourlamaque. Before departing Fort Carillon, however, the French lit a fuze to the powder in the main magazine under the southeast bastion. When it went off, it effectively destroyed the fort. Amherst entered what remained of

Fort Carillon on July 27 at a cost of only 5 dead and 31 wounded. The French soon abandoned and destroyed Fort St. Frédéric as well, withdrawing north to Île-aux-Noix, on the Richelieu River.

Amherst rebuilt the fort along its original plan, finishing its stone exterior. Now officially called Fort Ticonderoga, it served as a relay point for Brigadier General William Haviland's 1760 offensive down the Champlain Valley and Richelieu Valley.

After the end of the French and Indian War in 1763, Ticonderoga maintained a token garrison, being overshadowed by the new and larger Fort Crown Point. After Crown Point's accidental destruction by fire in April 1773, main operations shifted back to Ticonderoga. By 1775, however, Ticonderoga was in ruins. The hastily built stonework buckled each winter, the roofs leaked, and part of the east wall had collapsed. For Colonel Ethan Allen and his Green Mountain Boys and Captain Benedict Arnold, surprising and capturing Ticonderoga's 43-man garrison on the morning of May 10, 1775, took little effort, but the fort's past reputation gave their deed tremendous weight as one of the opening blows of the American Revolutionary War. The artillery captured by the Patriots at both Ticonderoga and Crown Point had a major impact on the war. The fort continued to play a significant role throughout the war before being abandoned shortly thereafter.

Fort Ticonderoga (New York), Battle of Event Date: July 8, 1758

The last major French victory in the French and Indian War (1754–1763). The Battle of Ticonderoga confirmed the martial reputation of French major general Louis-Joseph, Marquis de Montcalm. Although a spectacular triumph in its own right, the French victory did little to forestall the eventual fall of New France. That process began in earnest that same year through the loss of both Louisbourg and Fort Duquesne.

The French built Fort Ticonderoga in 1755 to defend the southern approaches to Canada through the Lake George–Lake Champlain corridor. It effectively deterred British offensive operations against the St. Lawrence settlements during the first years of the conflict. French troops used this forward operational base to great effect, keeping British forces on the defensive even though the latter possessed numerical superiority in the region. As such, under the strategic oversight of William Pitt the Elder in London, Ticonderoga became a principal British Army target in the 1758 campaign. The British assigned to the task of reducing Ticonderoga a formidable force of 6,300 regulars, including the 42nd Highlanders, and some 9,000 provincial troops. Taking the fort was to be a preliminary step to an advance on Montreal. Montcalm could muster only 3,500 men at the southern tip of Lake Champlain to stop the British advance.

Major General James Abercromby, the Earl of Loudoun's successor as commander in chief of the British forces in North America, led his troops up Lake George beginning on July 5, 1758. The resourceful Montcalm had not been idle while Abercromby's troops carried out their slow advance. Believing that his forces were outnumbered by at least five to one, Montcalm hoped to deny his opponents the opportunity to bring their full strength against Fort Ticonderoga in a conventional siege.

To thwart the British, the French threw up a strong barricade fronted by an abatis, a wooden entanglement of felled trees, on the strategic high ground where the British would want to deploy their artillery. A British reconnaissance party observed these newly constructed defenses on the morning of July 8. However, the British failed to discern the true design of the loopholed entrenchment, characterizing it as a flimsy barrier that could be easily penetrated. This miscalculation, in addition to faulty intelligence suggesting that a relief force of 3,000 additional French troops would soon make an appearance, led Abercromby to order his men to storm the barrier without the benefit of artillery support.

Abercromby's decision to overrun the suspect breastwork by a coup de mousqueterie was unorthodox. In a tactical situation requiring speed, this maneuver obliged troops to march forward to the enemy position before discharging their weapons and breaking through the palisade. The unified and deadly advance of such an assault was designed either to cause defenders to flee or die behind their parapets.

Following established military procedure, the British commander first established an advance screen of 50 men from each regiment, known as a picket. These soldiers were to protect the remainder of the army while it deployed for battle. They were supported by seven grenadier companies who preceded the main regular force, which was divided into three brigades.

This mammoth British tidal wave of regulars did not roll across the French entrenchment as Abercromby had envisioned. Instead of overwhelming the defenders by a combined frontal assault, the redcoats' orderly advance was impeded by a 100-yard obstacle course of pointed tree trunks and branches, underbrush, and stumps. The French obstacle prevented any coordinated British assault.

The critical first British attack launched in the early afternoon of July 8 turned out to be a clumsy affair, with each of the six line regiments engaging the French only in piecemeal fashion. In consequence, the defenders were not deluged by onrushing soldiers but were allowed to concentrate their fire as each unit appeared. Meanwhile, they reinforced vulnerable parts of their entrenchment at Montcalm's discretion.

Confusion reigned as some British troops were pinned down by French fire while other battalions withdrew. Only with great difficulty were regular officers able to bring their bewildered men to order. The assault regrouped throughout the afternoon. At British headquarters, Abercromby received conflicting reports about the attack. Only after repeated advances were arrested did he order, just before nightfall, the exhausted men to retire.

The dispirited British regulars left the battlefield behind a screen of provincial troops. They then embarked the next morning for their base camp at the southern edge of Lake George. British casualties in the assault on Fort Ticonderoga numbered 1,944, French casualties only 372. Montcalm's brilliant victory did not result in a strong counteroffensive because of the paucity of his resources. He thus had to be content with maintaining a defensive posture for the remainder of the year.

Fort Tombeché (Alabama)

French fortification built in 1736 on a high bluff along the Tombigbee River to stage military attacks against the English and the Chickasaws. Wanting to secure French power from Canada throughout the Mississippi River Valley, French officials sought to keep British traders from settling and claiming territory adjacent to the Gulf Coast. That land linked Fort Toulouse and trade centers with the Mississippi River. The French encouraged alliances with natives, especially the Choctaws, who despised the English for enslaving natives. The Chickasaws, however, sided with the British and protected the Natchez tribe, which had massacred French settlers in 1729 at Fort Rosalie.

As English traders increased their activity north of Mobile, French officials hoped to reinforce Choctaw allegiances to impede British trade and wage war with the Chickasaws. To accomplish this, the governor of Louisiana, Jean-Baptiste Le Moyne de Bienville, ordered construction of a fort to supply military troops at the confluence of the Tombigbee River and Warrior River. In spring 1736, an advance group traveled 30 miles past the confluence. They selected for the fort a strategic site atop 80-foot-high White Rock Bluff, named for its chalky limestone. Named Fort Tombeché, the site was almost 150 miles north from Mobile in Choctaw territory, near Chickasaw lands. Trade routes also passed nearby.

While the advance party built the fort, using the bluff and adjacent creek as natural defenses, Bienville assembled a force of approximately 500 French, Swiss, and black soldiers at Fort Condé. Those troops departed for Fort Tombeché on April 1, 1736. Choctaw allies accompanied them on the almost month-long trek north to the fort where they readied for battle. At Ackia, the Chickasaws victoriously resisted the French assault, forcing Bienville's troops back to Fort Condé. Meanwhile, at Fort Tombeché, workers were completing a storehouse, guardhouse, powder magazine, prison, and officers' quarters. When finished the fort featured bastions, earthworks, and a moat. Workers used cedar wood in the construction, which is more durable than pine. Fort Tombeché had the capacity to accommodate a garrison of up to 50 men.

The French retained a garrison at Fort Tombeché for almost three decades, reinforcing and enlarging the fort and trading weapons and goods for deerskins and crops. During the Choctaw-Chickasaw War (1752), troops from the fort fought anti-French Choctaws. The 1763 Treaty of Paris officially transferred Fort Tombeché to the British, who renamed it Fort York and manned it for five years.

After Spain's 1780 seizure of Mobile, Louisiana's Gov. Don Bernardo de Galvez sent soldiers to the abandoned Fort Tombeché to defend Spanish lands from settlers and guard river trade on the Gulf Coast. Renamed Fort Confederation, it remained under Spanish control until Pinckney's Treaty (1796) transferred it to the United States. The fort's site is located in modern-day Sumter County, Alabama.

Fort Toulouse (Alabama)

French military outpost built in 1717 among the Upper Creek peoples, situated at the confluence of the Coosa River and Tallapoosa River, 10 miles north of present-day Montgomery, Alabama. More commonly referred to as the "Alabama Fort," Fort Toulouse was one of several French settlements on the Gulf Coast, the first of which began at Mobile in 1702. Indeed, the French saw an opportunity to establish a strategic outpost among the Creek in the aftermath of the Yamasee War (1715–1717), when anti-English sentiment was at its strongest. In response to the desire by the Creeks for trade, the French erected a small fort more notable for its diplomatic role than for its military potential. They hoped Fort Toulouse could win Native American allies and connect French colonies on the Gulf Coast to the Great Lakes, effectively encircling the British and limiting their westward expansion.

In many ways, Fort Toulouse's relatively small size made it more influential than intended. The original fort and its 1751 successor were nearly identical. Each boasted wooden palisades, roughly 150 feet square, with bastions at the four corners. The garrison never numbered more than 50 men, although in the later decades of the fort's life, a small community of former soldiers and their families lived nearby.

The fort was rebuilt in 1751, and then contained several buildings that included a powder magazine, two barracks, and a small chapel. The bastions were outfitted with swivel guns and both 4-and 6-pounder cannon.

The fort relied on trade in foodstuffs with local natives for most of their provisions, while the natives brought English guns and tools to the fort for the French blacksmiths to repair. The trade at the fort reinforced amicable relations between the French and Native Americans. The French governors at Mobile and New Orleans also took advantage of the fort's convenient location for talks with American Indian headmen and the distribution of gifts. The Creeks never received enough in trade from Fort Toulouse to supplant the large quantities of goods brought by English traders, but nevertheless found the French presence advantageous, as this tended to forestall British aggression.

From the British perspective, Fort Toulouse was a threat greatly out of proportion to its size. The British feared the influence of the French garrison there over the Native Americans of the southeast, and were certain that French diplomatic overtures would convince the Creeks and possibly the Cherokees to storm the British colonies of South Carolina and Georgia. Although they long desired to destroy Fort Toulouse, the British could never win adequate native support for such an attack. The French, because of their paucity of trade goods, never led any native armies from Fort Toulouse. Thus the imperial contests in the southeast remained mostly diplomatic in nature. Fort Toulouse was finally abandoned in 1763, when the Treaty of Paris ceded all French claims east of the Mississippi River

to the British and the Creeks refused to allow the British to garrison the fort.

Fort Trent (Pennsylvania)

British fort erected in 1754 at the Forks of the Ohio River. Fort Trent marked the first English effort to establish a permanent military presence at the Forks of the Ohio. Although a small and rudimentary structure, the post could have controlled the junction of the Allegheny River and Monongahela River. The French capture and destruction of Fort Trent in 1754 provided the immediate spark for the French and Indian War (1754–1763) in North America.

By 1753, Virginia land speculators in the Ohio Company had claimed ownership of land in the Ohio River Valley. This assertion conflicted with French claims of ownership of the territory west of the Allegheny Mountains. In November 1753, Virginia's Lt. Gov. Robert Dinwiddie sent Major George Washington with a letter demanding that the French abandon their forts in the area. When the French refused, Dinwiddie issued colonial commissions to British traders in the region and took other steps to prevent further French encroachment.

William Trent, an experienced trader, received a commission as a captain in the Virginia provincial troops. Dinwiddie ordered Trent to raise a company of volunteers and to build a fort at the Forks of the Ohio. Meanwhile, Washington, promoted to lieutenant colonel, organized a larger force to occupy the area. The Virginia House of Burgesses accepted Dinwiddie's plan on February 14, 1754, but it demanded oversight of the spending of £10,000 authorized to pay for the fort and its garrison.

Trent was not able to enlist as many men as he had hoped. He named John Fraser as his second-in-command and Edward Ward, his brother-in-law, as ensign. Fraser was a trader who owned a post on Turtle Creek, six miles above the Forks of the Ohio, and he was more interested in his business affairs than in the new fort. Trent was only able to enlist 33 soldiers and 8 artisans for the garrison, along with a few local natives. They arrived at the Forks of the Ohio on February 17, 1754, and began construction of a fort.

Tanaghrisson (Half-King), a native chief friendly to the British, laid the first log. Trent based the building on a fortified storehouse he had constructed earlier for the Ohio Company at Redstone Creek. Ward later described the fort as "a strong square long house with loop holes sufficient to have made a good defence with a few men and very convenient for a store house, where stores might be lodged in order to be transported by water." Work proceeded rapidly, thanks to a ready supply of timber.

Trent's greatest problem was a shortage of supplies. Local natives refused to sell provisions, even at high prices. When he received reports in early April of a large French force approaching, Trent hurried back to Wills Creek to speed Washington's troops forward. Ward took command after Fraser refused to come to the fort, citing business concerns. A palisade of upright pointed posts was hurriedly built around the storehouse, and a gate was hung on April 17, just as 500 French soldiers and natives arrived.

The commander of the French troops, Captain Claude Pierre Pécaudy, Seigneur de Contrecoeur, demanded the fort's immediate surrender. Otherwise, he said he would employ his 18 cannon to destroy it, along with everyone inside. With fewer than 50 men and no supplies, Ward capitulated.

On April 18, Ward and his men took their arms and tools and marched back to Virginia territory. Pécaudy used the timbers from Fort Trent to begin the construction of a larger, more powerful structure. It became Fort Duquesne.

Fort Upper Tract (West Virginia)

British fort built in 1756 and located near the south branch of the Potomac River, the site of modern-day Upper Tract, West Virginia. Following King George's War (1744–1748), British and French

expansion into the Ohio River Valley created a new area of conflict between the two colonial empires. Following the defeat of Major General Edward Braddock and his British forces in 1755 during the French and Indian War (1754–1763), Virginia's frontiers contracted. They went from the Ohio River and shrank east to the western extremities of the Potomac.

In March 1756, Lt. Gov. Robert Dinwiddie authorized construction of a chain of forts along the Allegheny frontier, from North Carolina to Pennsylvania. Under the supervision of Colonel George Washington, these outposts were hastily built and garrisoned by small detachments of the Virginia Militia. In northwestern Virginia alone, the English colonists built more than 20 forts between 1755 and 1756, one of them being Fort Upper Tract. Captain Thomas Waggoner of the Virginia Militia supervised two of the forts.

Fort Upper Tract or Waggoner's Upper Fort, was a 90-foot-square stockade with four blockhouses. It complemented Fort Buttermilk, or Waggoner's Lower Fort, a stockaded fortification about 11 miles to the northeast. Between these two redoubts were several other forts of various descriptions, most of them housing 50 or fewer militiamen. The overall chain of forts varied in size and shape from a cave and palisade at Edes' Fort to the barracks, stable, officers' quarters, magazine, and four blockhouses at Fort Pleasant.

A Delaware raiding party leveled Fort Upper Tract on April 27, 1758. Nearby Fort Seybert suffered the same fate a day later. Although the latter was rebuilt and improved, what remained of Fort Upper Tract became the town of Upper Tract. The area was thereafter protected by John Justus Hinkle's stockaded fort, built a few miles to the southwest.

Fort Walpack (New Jersey)

British fortification built in 1755 on the New Jersey frontier during the French and Indian War (1754–1763). Situated in Walpack Township, Sussex County, Fort Walpack was one of a series of four forts constructed to protect the northern frontier of the colony stretching 60 miles along the Delaware River. Royal Governor Jonathan Belcher ordered construction of the forts in December 1755.

Sources identify Fort Walpack as a palisaded structure, 50 feet square with a wooden church and small blockhouse. The church was

most likely the Dutch Reformed Church of Walpack Township (built in 1737), located six miles between Van Campen's Fort and Fort Johns overlooking a strategic bend in the Delaware River. Also identified as Fort Number Three in this series of forts, Fort Walpack was the smallest. It did not have a family in residence, as did the area's other forts and required only 10 men to defend it. Although no record of any hostile action against the fort exists, Delaware warriors did actively raid in the surrounding area and on the Pennsylvania shore opposite the fort throughout the French and Indian War.

The fort remained intermittently active during the American Revolutionary War and carried the distinction of reporting the last known Native American raid on the New Jersey northern frontier in May 1782. Captain Emanuel Hover, who owned the lands surrounding the fort, pursued the raiding natives with a small company of militia, but with an unknown result. The church ceased to function as a fort after the war ended, but was still used for religious services by the Dutch Reformed Church and German Reformed Church until it was abandoned in 1898.

Fort West (Virginia)

An early, short-lived outpost built in 1609 on a small island near the falls of the James River, at present-day Richmond. At the time of its construction, a palisaded Powhatan village stood atop a nearby hill.

In August 1609, hundreds of new settlers arrived in Jamestown, which was already threatened with hunger because of short food supplies. Captain John Smith, president of the colony, decided to disperse part of the population in groups large enough to defend themselves but small enough to provide their own food. Thus, Captain Francis West departed with 120 men to the island at the falls and established West's Fort (or Fort West). At the time, some of the colonists were promoting West, the 22-year-old brother of Thomas West, Baron de la Warr, to take Smith's place as president.

Smith later visited the site, in West's absence, and determined that it was far too prone to flooding. He also promised the Powhatans a quantity of copper and protection against their rivals (the Monacans) if they would sell him their village, which he dubbed Fort Nonsuch. He then ordered West's settlers to relocate to the native village. The settlers objected, possibly in the mistaken belief that the riverside site controlled the route to the Pacific. They refused to leave and then rebelled. As a result, Smith and his sailors seized their supplies, whereupon the settlers attacked the natives

and stole their supplies. Attacked in turn by the natives, the settlers then finally submitted to Smith's authority. He arrested six or seven and relocated the rest to the hilltop village. West, however, moved the settlement back to the river site when he returned.

With the coming of winter, the settlers abandoned Fort West and returned to Jamestown, having lost several of their number to repeated Native American attacks. Indeed, they charged that Smith had "incensed and [a]nimated the Savages" against them. The Powhatans, according to Smith, complained that the settlers were worse than the Monacans.

The colonists established a trading post at the Fort West site in 1637. Richmond was laid out 100 years later, in 1737.

Fort Western (Maine)

Rectangular palisaded outpost built in 1754 along the Kennebec River at what is now Augusta, Maine (then part of Massachusetts). Fort Western served as the forward supply base to Fort Halifax, a second palisaded fort located approximately 20 miles upriver. Fort Western was also the jumping-off point for an expedition up the Kennebec at the opening of the French and Indian War (1754–1763) to find a rumored French fort being built at the assumed headwaters of the Kennebec River. Later, Fort Western served as the staging area for Colonel Benedict Arnold's grueling winter expedition to Quebec in 1775 at the beginning of the American Revolutionary War.

Located below the falls at the head of maritime navigation of the Kennebec and at the site of an early 17th-century Plymouth trading post known as Cushnoc, Fort Western was constructed under the direction of the Kennebec Proprietors, a group of wealthy Boston investors as part of their attempt to patent and settle lands in the region. Additionally, Massachusetts authorities desired to solidify their influence in the area by weakening French ties with the Abenakis by constructing Fort Halifax as a military base and trading post, and to counter increasing threats from the French, who did not concede British dominion over Maine.

Although neither French nor Native American forces directly attacked the post itself, Fort Western played an important logistical role during the French and Indian War and was close to the scene of active hostilities on the Massachusetts frontier. The installation consisted of a stockade and several buildings, including two blockhouses that included artillery.

In 1755, one of the garrison's soldiers was captured by hostile natives while acting as a courier to Fort Halifax and spent four years in captivity before he was released. On one occasion in 1757, several of the garrison's boatmen came under hostile fire as they ferried supplies upriver to Fort Halifax.

Because of its location at the head of navigation, supplies shipped up the Kennebec from Boston were unloaded at the fort and transferred to flat-bottomed boats, following which the supplies were rowed upstream by soldiers to Fort Halifax. Captain James Howard's Company of Massachusetts Provincials manned the fort from 1754 to 1767. Howard's command included his sons and a dozen or so other men, many of whom had originally garrisoned Fort Richmond, several miles downstream.

On the French surrender to British forces at Montreal in 1760, fighting in the region ceased and Fort Western's garrison was consequently reduced. Nevertheless, a post was maintained there by provincial authorities until sometime in 1767. At that point, Captain Howard acquired the fort and nearby lands. There he opened a store and engaged in the timber business for many years.

In 1775, during the American Revolutionary War, Arnold used the fort as the staging area for his expedition against Quebec. His forces gathered at Fort Western as his troops and carpenters constructed numerous bateaux and collected supplies there. Arnold's officers at the fort included such notables as Daniel Morgan, Aaron Burr, and Henry Dearborn.

The fort reverted to a store after the American Revolutionary War. Opened to the public in 1922 as a museum, Fort Western's main house is the oldest surviving wooden military structure in the Unites States.

Fort William (Massachusetts)

English fort constructed in 1655 on Winter Island in Salem Harbor, Massachusetts. Fort William was one of the earlier defensive works in the colony of Massachusetts. As with other early defensive posts, it was a municipal fortification, and not, like the later Northfield forts, a buffer between the frontier and the eastern settlements.

The first fortification in Salem was the Salem Fort, built in 1629 and meant to protect the landward side. Fort William faced out to sea, and protected both Derby Wharf and the Salem Neck. Together with Fort Sewall to its south, it also commanded the small stretch of sea between Salem and Marblehead, one of the earliest natural harbors in use by Massachusetts settlers. Along with the Gloucester forts, it helped to protect the sea lanes stretching southwest to Boston.

In addition to its port defense function, Fort William was also well suited for docking ships. Indeed, in modern times the site served as a repository for depth charges and a small base for the U.S. Coast Guard. In its day, it may also have served as a last bastion of refuge, had Massachusetts settlers been driven from their coastal settlement.

From its foundation in 1655, Fort William saw relatively little service. It was not threatened either with native attack or by the naval forces of other European powers. In 1703 it was upgraded and renamed Fort Anne in honor of England's new queen. Captured by Patriot forces in 1775 during the American Revolutionary War, it was renamed Fort Number Two.

Fort William and Mary (New Hampshire)

British garrison erected around 1632, originally called the "Castle," which served as the primary defense for Portsmouth Harbor, New Hampshire, throughout the colonial period. Fort William and Mary began as little more than an earthen redoubt aimed at providing a modicum of protection for the fledgling seaport. But as Portsmouth grew and prospered, the community recognized the need to improve its defenses, especially against the threat of French privateers and naval warships. A wooden blockhouse was added in the 1660s and, during King William's War (1689–1697), a breastwork was built to accommodate extra cannon. It was also at this time that the community renamed the structure "Fort William and Mary" to honor the new English monarchs, whom residents saw as protectors of their political liberties and Protestant faith.

War against the French in the 18th century often spurred officials to make further improvements to Fort William and Mary's fortifica-

tions. In 1705, amid Queen Anne's War (1702–1713), stone walls went up around the fort and a well was dug to provide fresh water for the garrison. Typically, only a handful of soldiers guarded the structure, although reinforcements were added in times of emergency.

Although the fort's prominent position overlooking the harbor may have been militarily advantageous, it also exposed it to ocean storms that forced frequent maintenance. Repairs were made in the 1750s along with the addition of more guns in response to the French and Indian War. Other breastworks and batteries were built around Portsmouth Harbor, but Fort William and Mary remained the centerpiece of the area's coastal defenses.

If victory over the French made the fort seem somewhat superfluous after 1763, colonial tensions with the British Crown would increase its importance in the following decade. As the seat of royal authority in New Hampshire, Portsmouth was unable to avoid the political issues that drew the colonies toward revolution in the 1770s. Incidents such as the 1770 Boston Massacre put Portsmouth residents on edge, which manifested itself in more improvements to Fort William and Mary. The addition of a barbette battery and embrasures through which cannon could be fired from behind a substantial stone wall made the fort more sophisticated than ever before. The year 1771 saw the construction of Portsmouth's first harbor light at Fort William and Mary, used to guide merchant vessels and British warships safely into the seaport. Events would soon

show the wisdom for such improvements, as developments in Boston increasingly attracted attention to Fort William and Mary.

In response to the Boston Tea Party of December 1773, the next year Parliament ordered the port of Boston closed to commercial traffic, which redirected maritime trade toward other coastal communities such as Portsmouth. At the same time, growing concern about the potential for violence prompted rumors that British officers planned to transfer Fort William and Mary's munitions for use in Boston. As a result, Portsmouth's Patriot leaders resolved to raid the lightly guarded fort and carry off the supplies before the British could carry out such a plan. The scheme was executed without bloodshed on the night of December 14–15, 1774, after which British warships arrived to secure the fort and eventually remove its remaining stores before it was abandoned.

Fort William Henry (Maine)

English outpost built in 1692 and located near Pemaquid (present-day Bristol), Maine (then part of Massachusetts). Built at tremendous expense, Fort William Henry was the first stone fort in New England. It was also one of the most remote posts in British-held territory.

In 1689, at the opening of King William's War (1689–1697), Abenaki warriors razed Fort Charles, New England's easternmost fort. Gov. Sir William Phips of Massachusetts then resolved to build a new fort on the site that would intimidate the Abenakis and their French allies. The result was Fort William Henry, built in the summer of 1692.

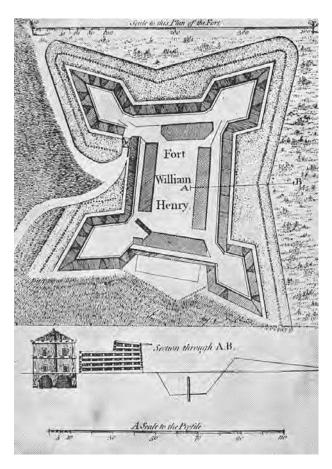

Contemporaries estimated that the fort required 2,000 cartloads of stone and cost £20,000 to construct. Fort William Henry had 6-foot-thick stone walls, a sizable bastion, a tower rising 29 feet in the air at one corner, and two smaller towers. A formidable structure for its day, reportedly it mounted 18 cannon.

In August 1696 a combined French-Abenaki force besieged the fort. For all of its cost, Fort William Henry's design and construction were fatally flawed, and those shortcomings now became apparent. The fort's well lay outside the walls, making a protracted siege almost certainly successful. And although workmen had imported stone for the walls from Massachusetts, they had made mortar from the sand

and clay of the nearby beach. This makeshift mortar held poorly. When the defenders fired the fort's cannon against the besiegers, the tower holding the cannon cracked and swayed. French messengers warned the fort's commander, Pasco Chubb, that they would breach the walls with cannon fire, leaving the defenders to the mercy of the Abenakis. Chubb, terrified of this prospect, surrendered the fort to the French and their native allies, who promptly destroyed it.

The ruins of the fort lay undisturbed until 1729, when Colonel David Dunbar, royal surveyor, established a new town at Pemaquid, ostensibly to serve as a bulwark against the Acadian French. He promised to rebuild the ruined fort, which he renamed Fort Frederick. Though he submitted a bill for its reconstruction, other records attest that he merely hoisted a flag over Fort William Henry's collapsed structure. Local English inhabitants, dismayed by Dunbar's encroachments, challenged his right to settle the area. The Crown decided in their favor and Dunbar and his men departed in 1733.

Massachusetts declined to improve the fort, though it retained a small garrison there until 1759. The departing soldiers removed the fort's remaining cannon to Boston. The fort itself continued to deteriorate. In 1775, the townsmen of Bristol voted to destroy Fort Frederick to deny it to the British, but there is no record that they actually did so. Perhaps by then the fort's condition was such that to pull it down would have been redundant.

Plan of Fort William Henry on Lake George, New York, 1763. (The Granger Collection)

Fort William Henry (New York)

Constructed in 1755 on Lake George's southern end, Fort William Henry evolved as a forward base for a British thrust into the Champlain Valley. The fort gained notoriety for its destruction in August 1757 during the French and Indian War (1754–1763).

In the aftermath of Sir William Johnson's victory at the September 1755 Battle of Lake George, he established a fort near the battle site. Beginning in October, Captain (later Major) William Eyre, a British Army engineer, directed the construction. Johnson named the fort William Henry for two of George II's grandsons. Simultaneously, 30 miles to the north at Ticonderoga, the French constructed Fort Carillon.

Eyre selected a site on Lake George's southwestern end. Protected by marshes to the east and south and the lake to the northeast, the earthwork fort could only be easily approached from the northwest. To better defend the site and provide shelter for troops beyond the fort's 500-man garrison, Eyre reinforced Johnson's entrenched camp on a southeastern hill overlooking the site. Roughly 400 feet square with four angled corner bastions, the fort's 30-foot-thick walls consisted of local timber secured into square cribs filled with earth. The walls narrowed to 12 to 18 feet thick to allow a firing step for the fort's 10 artillery pieces.

French forces under François-Pierre de Rigaud de Vaudreuil raided the fort before dawn on March 19, 1756. Vaudreuil and his 1,500 men had traveled southward from Fort Carillon on Lake George's ice. They burned a number of boats and storehouses. However, without artillery, Vaudreuil could do little but besiege the post for four days before retiring northward. That summer, the fort prepared for a campaign that never materialized. Stockpiled supplies included 10 heavy guns that the garrison incorporated into its defense.

While English forces massed for operations elsewhere in 1757, Major General Louis-Joseph, Marquis de Montcalm, led a large French force across Lake George against the English outpost, which fell on August 9. Rather than press an attack against Fort Edward, Montcalm then destroyed Fort William Henry and withdrew to Fort Carillon.

Fort William Henry (New York), Siege of

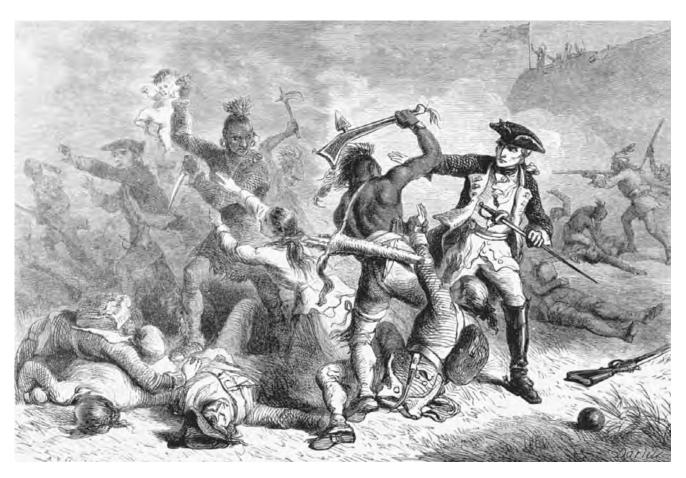

Start Date: August 3, 1757 End Date: August 10, 1757

August 1757 siege of Fort William Henry (New York), situated at the head of Lake George. Best remembered through James Fenimore Cooper's thrilling, albeit inaccurate, *Last of the Mohicans* and its various adaptations, the siege of Fort William Henry and the subsequent "massacre" of the Anglo-American garrison there demonstrated the limitations of both French and British power in upstate New York and the difficulties of fighting alongside allies from an alien culture. This event occurred at the height of the French and Indian War (1754–1763).

Left with a reduced garrison by John Campbell, Lord Loudoun, who was concentrating his forces for an attack on Louisbourg, and damaged by a surprise winter attack, Fort William Henry in 1757 was not in a particularly good position to resist a siege. Although the fort's strong walls could only be breached by cannon and it was impractical to bring cannon overland, the winter attack had destroyed the nearby British boats and ships. With them removed as a threat, the French could transport artillery to the fort via Lake George.

Meanwhile, Major General Louis-Joseph, Marquis de Montcalm, had decided that Fort William Henry and the chain of British posts stretching south would be his primary targets for 1757. As such, Montcalm gathered 6,000 French regulars, Canadian militiamen, Troupes de la Marine, and almost 2,000 Native American allies drawn from as far away as Wisconsin and Iowa. Language barriers frequently hampered Montcalm's control of this multinational force, as did the fact that the natives came as allies to the French force, not auxiliaries.

At the same time, Lieutenant Colonel George Monro prepared to defend Fort William Henry with some 1,500 mixed British regulars and colonials, and a battery of 18 heavy cannon. An initial reconnaissance in force to ascertain French intentions ended in disaster when it was ambushed at Sabbath Day Point. The local commander, Major General Daniel Webb, beat a hasty retreat to Fort Edward, promising support for his soon to be besieged subordinate.

Depiction of the attack by Native Americans on the English column departing Fort William Henry. The attack occurred on August 10, 1757, following the surrender of that place to the French and a promise of safe conduct. (Library of Congress)

Montcalm's forces began the siege on August 3, 1757. He followed European practices, building a series of trenches that moved his batteries ever closer to the fort. British efforts to disrupt the French advance became increasingly ineffective as the fort's own cannon burst one by one under the pressure of sustained use. Monro's casualties mounted, both because of his own defective cannon and French high-angle fire into the fort. On August 7, 1757, Montcalm passed to Monro an intercepted message from Webb declining to send reinforcements. With his walls crumbling under the French fire he could no longer effectively return and the final breaching battery in place, Monro sought cease-fire terms on August 9, 1757.

Montcalm offered terms including safe passage to Fort Edward and the retention of both personal effects and a symbolic field cannon. Fort William Henry's stores would thus become the property of France. These terms were intended to honor the British for their courageous defense, but Montcalm failed to consult his allies in issuing them. The Native Americans accompanying his expedition had done so in pursuit of personal honor, reflected in captives, scalps, and booty, rather than any love of the French cause. This failure to communicate set the stage for trouble even worse than that between Montcalm and his native allies at Fort Oswego the previous year.

It is unclear exactly how well the terms of surrender were conveyed across the language barriers to the assorted tribes. It is possible that the French traders serving as translators, no more satisfied with the terms than the natives themselves, failed to pass them on accurately or covertly encouraged the warriors to violate them. Many natives saw the terms not only as a betrayal by Montcalm but also as a conspiracy between whites.

Following the British evacuation of Fort William Henry, several Native Americans entered the fort and scalped the wounded and ill who were left behind as unable to travel. French sentries and missionaries were able to save only a few of them. The night of August 9–10, 1757, was spent in terror by many of the British, as the natives' unhappiness with Montcalm's terms became clear.

As the British column began the march to Fort Edward, some warriors demanded personal possessions as booty of war. Panicking soldiers and civilians handed over their packs, which precipitated a chaotic crisis. The majority of the natives had not been involved in the initial seizures, but quickly joined in when they realized that there was booty to be had after all. Many in the British column panicked, fleeing in all directions as warriors began seizing captives as well as booty. Panic fed panic along the British column, and the heavily outnumbered French escort proved reluctant to intervene. Montcalm,

hurrying to the scene, actually made matters worse as natives, seeing that Montcalm was attempting to deprive them of their captives, scalped them to retain these second-best trophies.

By historian Ian Steele's count, between 69 and 184 British died in the confusion, with the remainder becoming permanent captives in Canada and beyond. Many more were held temporarily and ransomed or exchanged. Hundreds made their way to Fort Edward where their stories, exaggerated by panic and confusion, stunned the British who then expected an immediate attack. Instead of attacking, however, Montcalm burned Fort William Henry and returned north. His forces were substantially reduced as his native allies, who had obtained their purpose in accompanying him, returned home rather than follow on south.

Montcalm was deeply distressed by the violation of his terms of surrender and thereafter minimized Native American participation in his campaigns, which substantially weakened the defenses of New France. Montcalm's allies were also weakened by smallpox contracted from their captives. The British eventually recovered from the shock of the incident, although thereafter British commanders denied surrendering French garrisons the honors of war in retaliation for the supposed betrayal at Fort William Henry.

Reconstructed blockhouse from Fort Wolstenholme, Virginia. The fort was originally built in 1619. (The Granger Collection)

Fort Wolstenholme (Virginia)

English fort built in 1619 on the James River, nine miles to the east of the Jamestown settlement. Fort Wolstenholme was the administrative center of Martin's Hundred Plantation between 1618 and 1625. In 1618, London investors sent 220 settlers to Martin's Hundred to capitalize on the tobacco boom. This new James River plantation had been part of territory belonging to the Powhatan Native Americans, but was deemed "unoccupied" by the English.

The central fort, erected sometime in 1619, and named for one of the investors, Sir John Wolstenholme, was home to about 40 of Martin's Hundred settlers. It was both an administrative center for Martin's Hundred and a refuge for the scattered settlers of the plantation during an attack. The structure was roughly 130 feet long and 85 feet wide. The fort contained four watchtowers, cannon, and platforms for musketeers. Significantly, however, these were oriented toward the river, not the land, because the settlers were more concerned about Spanish ships than the Powhatans, with whom they had enjoyed friendly relations since 1614.

The colonists' outlook on the Powhatans changed forever on March 22, 1622, when the Powhatans mounted a well-organized surprise attack on several English settlements simultaneously. Their chief motivation was concern over the growth of the English colony both in terms of population and geographical extent. About 350 settlers, fully one-fourth of the colony's population, died that day. Martin's Hundred was hardest hit. There between 50 and 70 settlers died and several others were taken captive. The survivors fled to Jamestown. A year later, about 50 settlers returned to Fort Wolstenholme, but they suffered greatly from starvation and disease, and the fort was abandoned around 1625.

Fox

Native American tribe that inhabited the western Great Lakes area at first European contact in the late 17th century. The Fox tribe is best known for the two wars it fought with the French in the 18th century in order to prevent the French from trading with their traditional enemies, the Dakota (Santee) Sioux. The Fox spoke a dialect of an Algonquian language they shared with the Sauks, the Kickapoos, and possibly the Mascoutens. More than likely these four groups lived together as one people long before the arrival of Europeans to the western Great Lakes. The Fox developed a cultural pattern that reflected their life in the area between the Eastern Woodlands and the western prairies that eventually fades into the Great Plains.

A French missionary, Father Claude Allouez, made first contact with the Fox between 1665 and 1667. A smaller group than most of the other tribes in the region, they therefore attracted few traders to their villages. From the beginning, the Fox opposed the extension of the French trade to their traditional enemies to the west, the Dakota Sioux. The French wanted to open up trade relations with the Dakotas because of their direct connections with the Plains tribes and because they were such a large group. Not only would trade with these new groups bring in beaver pelts from the distant Rocky Mountain region, but the Sioux could also provide the French with buffalo skins. As a result, the French paid little heed to the wishes of the Fox tribe. Over the years, simmering tension between the Fox and the French grew into open hostilities.

In 1712, the French incited a group of friendly tribes to attack a group of Fox and Mascoutens that had moved to the area near Detroit. The French commander accused the Fox of planning to destroy the fort. After being besieged in their town for 19 days and fighting a contested retreat, some of the Fox made it back to Wisconsin. From their home west of Lake Michigan, the Fox began a series of attacks and ambushes on French traders that eventually forced the French to mount a counter offensive in the form of a force to attack the Fox in their home territory. Eventually in 1716 the Fox and French signed a peace treaty that ended hostilities between the two for a decade.

Still unhappy with the constantly expanding French trade network, in 1728 the Fox began to assemble an alliance intent on limit-

ing French influence in the western Great Lakes. In an effort to end this threat once and for all, the French launched a war of extermination against the Fox with allied Dakotas, Ojibwas, Potawatomis, Winnebagos, and Wyandots. Initially, the former allies of the Fox, the Kickapoos and the Mascoutens, also joined the war against them. After the defeat of a large group of Fox south of Lake Michigan in 1730, the Fox sought protection among the Sauks near Green Bay in 1733, and asked the French to accept their surrender. Bent on the genocide of the tribe, however, the French refused. Eventually, the Sauk and Fox tribes immigrated to the area of present-day Iowa to escape the French. In 1737, The French then agreed to conclude peace with both the Fox and the Sauks, permanently ending these hostilities.

In 1766, both the Sauks and the Fox temporarily returned to Wisconsin, but by the end of the century, both peoples had again removed to Iowa. From the time when the Sauks gave refuge to the Fox, both tribes remained in a close alliance, although each retained its separate status. In the early 19th century, the U.S. government removed both tribes from Iowa to the Indian Territory, although some tribal members did manage to avoid removal and remain in the Iowa and Illinois area. Today most Fox tribal members live in Oklahoma, Missouri, Iowa, and Illinois, and most of these are affiliated with the Sauk and Fox Nation of Oklahoma, which is officially recognized by the U.S. government.

Fox Fort (Illinois), and Siege of

Start Date: August 4, 1730 End Date: September 9, 1730

Fox Fort was a defensive fortification built by the Fox tribe (Mesquakie, Outagami) in eastern Illinois, which was besieged by

a large Native American and French coalition during August–September 1730. According to contemporary French drawings, Fox Fort covered a little more than an acre of land. It featured a loose palisade except on the south, where the riverbank formed a natural barrier. Trenches were dug along the palisade, and a screen of branches allowed the fort's defenders to shoot between the palisade poles while protected from the view of their enemies. Within the fort were subterranean shelters consisting of burrows four feet deep and covered with reed mats and soil. A series of shallow ditches connected the shelters to one another and to the river. Trees provided shade from the summer sun. The exact location of the fort has long been disputed, but it is believed to have been near the headwaters of the Sangamon River.

In 1729, toward the end of the war between the Fox and the French and their pro-French native allies, a group of belligerent young Fox warriors, members of the warrior society known as Kiyagamohag, killed a pair of Kickapoo and Mascouten hunters over a minor grievance. As a consequence, both the Kickapoos and the Macoutens, long-term allies of the Fox, turned against them and sided with the French. Other past friends, such as the Winnebagos, seeing the Fox cause as increasingly hopeless, joined the coalition against them. Fox leaders tried unsuccessfully to persuade their allies to remain at their side, but in the end, they found themselves completely isolated among the Native Americans in the region.

Seeing no other solution to their dilemma, the entire Fox Nation undertook to relocate to the territory of the Senecas (a tribe of the Iroquois Confederation) in western New York, with whom they had long cooperated in the fur trade. In order to avoid their adversaries in the upper Great Lakes region, the Fox proceeded to the south, abandoning the familiar woodlands of Wisconsin for the open grasslands in the Illinois Grand Prairie. Their progress was slow because they had with them many elderly people and young children.

Near the Illinois River, the Cahokias (a tribe of the Illinois Confederation) spotted the Fox and reported their presence to the Lakes Indians. The Cahokias trailed the Fox as they continued their trek. Then, on August 4, 1730, the Fox decided to make a stand in a grove of trees by a small river. The Cahokias harassed them there until the arrival of Kickapoo, Mascouten, and Potawatomi war parties. Unable to escape any farther, the Fox constructed Fox Fort around the grove.

As the month of August passed, the siege was reinforced by more Illinois, Sauk, Miami, Wea, and Piankashaw war parties and by French soldiers and Creole traders from Fort Chartres, Fort St. Joseph, and Fort Ouiatanon. During the siege, the attackers constructed a siege tower, guard posts, and a trench. The Fox had hoped that the Sauks, the Weas, and the Piankashaws, closely related tribes, would come to their assistance. When they joined the siege instead, the Fox initiated negotiations, both openly with their enemies as a whole and quietly with the groups related to them. The Fox released those Illinois whom they had taken captive and asked to be allowed to continue to Seneca territory, but to no avail. They also offered to surrender and to be divided among the Sauks, the Weas, and the Piankashaws, who would teach them to make peace

with the French. One French commander was receptive to this proposal, but two others dismissed it as a ruse and an attempt to corrupt the other natives. Quietly, the Fox persuaded the Sauks and the Weas to take most of the Fox children out of the fort. The Sauks and the Weas also shared with them some of their surplus food and ammunition. These side deals, when discovered, spurred the Illinois and the French to maintain sporadic gunfire on the fort so as to discourage any further secret meetings.

By early September, the Fox were boiling clothing and moccasins for food. On the other side, more reinforcements arrived—Hurons, Potawatomis, and Miamis under a French commander—with orders from the governor-general of New France forbidding any negotiated solutions. Then, on September 8, after weeks of heat and humidity and near-starvation, the Fox escaped in the dark of night under the cover of a fierce and sudden thunderstorm and made their way southwest across the prairie.

Exhausted, malnourished, still accompanied by their elderly and some of their children, the Fox were not difficult to overtake. On September 9, about 12 miles from Fox Fort, they confronted a force of nearly 1,200 attackers and were quickly vanquished. Estimates of the Fox dead include 200–300 warriors and 300–600 women and children. About 50 warriors escaped, some of whom were later captured, tortured, and burned to death.

Fox Wars

Start Date: 1712 End Date: 1737

A series of armed conflicts among the Fox Indians (also known as the Mesquakies or Outagamis), New France, and French Native American allies between 1712 and 1737. The Fox War officially began when the French, the Potawatomis, the Odawas, the Ojibwas, and the Wyandots destroyed a Fox-built fort and settlement at Detroit in 1712. It ended when a delegation of Great Lakes tribes traveled to Quebec in 1737 to request that the governor of New France have mercy on his defeated foe. The war became a genocidal conflict as the French sought to essentially exterminate the Fox Nation. By

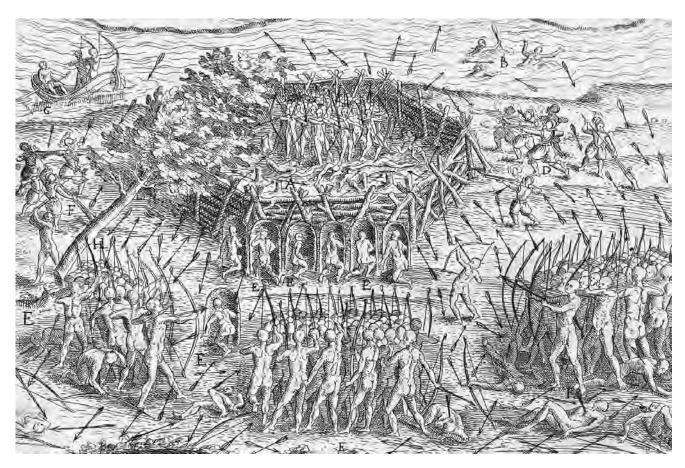

1737 the Fox numbered fewer than 1,000 people, whereas at the start of the conflict their population was more than 5,000.

The causes of the Fox War, although largely attributed to the arrogance and bellicose nature of the Fox, had their beginnings in the Beaver Wars (1641–1701) and the reemergence of the fur trade in the Great Lakes. In the 17th century, the Fox were driven from Michigan lands by the Iroquois, the Hurons, and the Ojibwas. By the 18th century the Fox had resettled in Wisconsin and engaged in conflict with the Dakota Sioux. In the late 1600s, French traders had entered the Wisconsin region where they initially traded with the Fox and continued to expand westward. Eventually, the French added the Dakota Sioux as customers of European goods, particularly weaponry. The Fox began harassing and killing French traders, especially those known to be carrying muskets. These actions led the Fox to seek allies outside the French sphere of influence, and by 1701 they had concluded an alliance with the Iroquois Confederation. Initially declining fort commander Antoine Laumet de La Mothe de Cadillac's 1701 invitation to establish a village at Detroit, the inhabitants of several Fox villages had decided to relocate to the Detroit region by 1710. This move not only brought the anti-French Fox closer to the Iroquois and English, but placed them among natives who were pro-French and former enemies.

The immediate catalyst of the Fox War was an attack by the Ojibwas and the Potawatomis on a group of Mascoutens who were allied with the Fox. In the raid, 200 Mascoutens died while the survivors fled to a nearby Fox village. In retaliation, Fox and Mascouten warriors attacked the French and their allies alike, eventually laying siege to Fort Pontchartrain de Detroit. The fort's commander, François de La Forest, under siege and fearful of reprisals from France's native allies for failing to aid them, committed supplies and troops to the battle. Following several days of siege, the Fox attempted to flee during a thunderstorm.

More than 1,000 Fox and Mascoutens were killed with fewer than a hundred managing to escape. Those captured were either executed or sold into slavery. As soon as news of the defeat reached the Fox and the Mascoutens in Wisconsin, they made the area unsafe for French traders or their allies between 1712 and 1716. This conflict in the Great Lakes forced the French to construct Fort Michilimackinac in 1715 across the Mackinac straits from Fort Buade, which had been neglected since the French had officially abandoned the interior in 1698 due to an overstock of furs.

In 1716, 400 French soldiers, including a battery of artillery, and 1,000 native allies advanced into Wisconsin to attack the Fox. After a brief siege on one of their villages, the Fox agreed to keep the peace. This development reopened trade in the Wisconsin region. How-

ever, Fox accusations that the Illinois and French allies continued to raid Fox villages and attack hunting parties, combined with refusal of the Illinois to return captives, appear to have been the underlying factors of the continued warfare between these two groups. Because the Illinois Country had been placed under the authority of French Louisiana, Quebec's Gov. Charles de la Boische, Marquis de Beauharnois, refused to intervene despite pleas from the Jesuits and the Louisiana governors, Pierre Dugué de Boisbriand (1724–1726) and Étienne de Périer (1726–1733). With increasing pressure from Louisiana, Jesuits, and Canadian merchants, Governor Beauharnois dispatched 1,500 men against the Fox in 1728, an expedition that failed to locate any Fox villages.

In the 1720s, the Fox reaffirmed their alliance with the Iroquois, and built new alliances with the Chickasaws and the Abenakis. Kiala, a Fox war chief, recognized the need for a united stance against European colonies. Indeed, his efforts threatened not only the French alliance system, but threatened to cut Louisiana off from New France. Importantly, the French also sought to stop the anti-French Abenakis, led by Nescambiouit, from joining the Fox in the interior. Such a move by the Abenakis would have strengthened the Fox while removing a buffer between New England and New France. Hence, Beauharnois saw the destruction of the Fox as absolutely imperative.

In 1730, the Fox experienced a second disastrous defeat, reminiscent of Detroit in 1712, when they left their villages in the Illinois-Wisconsin region in an attempt to join the Senecas in New York. Trapped during their flight across the Illinois prairie, the Fox fortified a grove of trees (Fox Fort) and after a siege attempted to sneak away during an intense summer storm. Detected by their attackers and slowed by their families, more than 1,000 men, women, and children were killed with dozens taken captive.

In 1733, the Fox sued for peace and a delegation of four leaders, including Kiala, arrived in Montreal in 1734 to finalize their surrender. The French arrested the peace delegates, sending one to France to serve in the galleys. Kiala was sold into slavery, and the remainder were scattered among the missions and towns of Quebec. As the French intensified their campaign to exterminate the Fox, other Great Lakes tribes began to fear the outcome if they allowed the Fox to be destroyed. During 1734-1735, French native allies released Fox prisoners, and began to refuse assistance to the French in what had now become a genocidal conflict. When a group of Great Lakes nations accompanied by the Fox arrived in Quebec to seek peace in 1737, Governor Beauharnois agreed. His decision was partly motivated by conflicts in the Mississippi region, such as the Natchez War (1729-1733) and the Chickasaw Wars (1731-1745), which drew French interest, troops, and supplies. Furthermore, growing tensions with the English colonies due to their efforts to lure away French Indian allies and increase their presence in the interior, as well as increasing tensions in Europe, contributed to the acceptance of peace in the Great Lakes region.

The Fox War is noteworthy not only as an example of attempted genocide by the French, but also because it reshaped French poli-

cies in the pays d'en haut (upcountry). First, the Fox War made it clear that the French presence in the interior depended on the cooperation and sufferance of the natives. The war amply illustrated that despite French efforts to enforce a Pax Gallica, they were entirely reliant on native cooperation. Second, it showed the tribes of the Great Lakes that the French could be dangerous, and most importantly, that the existence of a benign middle ground was tenuous at best. Third, the war illustrated that canoe routes from Lake Michigan to the Mississippi were not secure. This fact forced the French to rely on the Ohio River system as vital to the maintenance of their American empire and northerly rivers for westward expansion and trade. Thus the expansion of the French presence in the Ohio River Valley greatly contributed to the series of conflicts with the English that ended with the conquest of New France in 1760. Finally, the war showed the French that their alliance system in the Great Lakes was neither stable nor absolute. Nor did the conclusion of the Fox Wars end warfare in the Wisconsin-Illinois region. The Illinois continued to suffer raids by the Fox and others into the 1750s.

France

During the early modern period, France forged its first overseas empire, a series of loosely connected colonial possessions in North America, the West Indies, Africa, and Asia. New France, as the vast zone of French influence and possession in North America came to be known, acquired over the course of the 17th and 18th centuries a significant economic and strategic importance. Yet the exploration, exploitation, and colonization of this territory remained on the periphery of French interest. Indeed, the major undertakings of the French Crown revolved around dynastic ambitions, economic competition, and military opportunities on the European continent. A continental—rather than a colonial—strategy dominated French war planning throughout the period.

French fishermen began frequenting the Grand Banks off Newfoundland during the first decade of the 16th century. Shortly thereafter, French pirates began to sail into the Caribbean with the hope of raiding Spanish treasure fleets and settlements. It was some time before the French Crown, engrossed as it was in the Italian Wars, turned toward the Atlantic. News of Hernán Cortés's conquests and of Ferdinand Magellan's circumnavigation prompted King François (Francis) I (1494–1547) to commission and finance a first official expedition. It set sail in 1524 under the leadership of the Florentine navigator Giovanni Verrazano. The Crown hoped that a passage to the East Indies would be found somewhere between Newfoundland and Florida. Verrazano's search proved fruitless, though he surveyed the coast of North America from what is today North Carolina north to Cape Breton. In so doing, he laid the foundations of France's territorial claims.

King François I openly rejected the papal bull *Inter caetera* (1493) that divided all newly discovered lands between Spain and Portugal. Indeed, he is said to have sarcastically requested that he be shown the clause in Adam's will that excluded French authority from the New World. Between 1534 and 1541, he financed three additional voyages, the first two led by Jacques Cartier and the last under the nominal leadership of the Protestant Jean-François de La Rocque de Roberval.

French hopes of finding gold, spices, or a passage to the Indies were again dashed. Even so, Cartier ceremonially took possession of the new lands, pushing his explorations up the St. Lawrence River as far as the island of Montreal, encountering native populations with which he maintained increasingly strained relations. A settlement established during the third voyage near the later site of Quebec was abandoned in 1543.

Because of these early disappointments, the French Crown lost interest in exploration and settlement. Official endeavors were further discouraged by the 40-year-long series of civil wars that erupted in 1562, pitting Catholics against Protestants, and the Crown against great noble families. A few years before, Admiral Gaspard de Coligny, an influential Protestant leader, had begun sponsoring expeditions to establish an American colony where his fellow Huguenots

Illustration showing Florentine explorer Giovanni Verrazano, sailing in the pay of France, arriving in present-day Newport Harbor in 1524. Verrazano's voyage was the foundation for subsequent French claims to North America. (North Wind Picture Archives)

might freely practice their religion. In 1555, a first attempt at a New World settlement was made by Nicolas Durand de Villegaignon in the bay of Rio de Janeiro. Internecine struggles and a Portuguese military intervention brought about the demise of the settlement five years later. Jean Ribault and René Goulaine de Laudonnière established Charlesfort in what is now South Carolina in 1562, abandoning it four years later to establish Fort Caroline in northern Florida. The Spaniards quickly destroyed it, motivated by religious fervor and a fear that their Caribbean holdings were threatened.

Coligny's assassination during the St. Bartholomew's Day Massacre of 1572 drew the monarchy firmly into the Catholic camp and brought an end to the dream of a Protestant New France. A handful of minor colonial enterprises followed, but by the end of the 16th century, French ventures on North American soil had not led to permanent settlement.

Fishermen continued to frequent the Grand Banks, and, increasingly since midcentury, fur-trading expeditions periodically visited the interior of the St. Lawrence. Colonization would come to rest primarily, and be hindered by, the lucrative trade in beaver pelts. After having achieved civil peace in his kingdom, King Henri (Henry) IV (1589–1610) enlisted private resources and energy to exploit the overseas territories to which the Crown laid claim, chartering commercial companies to operate as monopolistic enterprises in what came to be known as New France. Trading posts were established at Port Royal, Acadia, in 1604, and at Quebec in 1608.

Before long, colonists came into conflict with American Indians and newcomers alike. Although trade with the western Hurons and Algonquins secured the colonial economy, it also drew the French into existing political and military rivalries. In 1609, Samuel de Champlain campaigned alongside his allies against the Iroquois, setting the tone for a century of intermittent warfare known as the Beaver Wars. Moreover, the monopolists did little to promote colonization or to provide adequate protection, both of which would minimize their financial gains.

Thus, French trading posts easily fell prey to intercolonial competition. In 1613, the settlement of Port Royal was sacked under Samuel Argall, who had been commissioned in Virginia to expel French nationals from the territory claimed by England. An expedition led by David Kirke and his brothers took the post of Tadoussac in 1627. Two years later, they captured Quebec and a rebuilt Port Royal. France protested, noting that the Treaty of Susa had just been concluded with England. But only after protracted negotiations and the signing of the Treaty of Saint-Germain-en-Laye (1632) did France recover its fledgling North American outposts.

Cardinal Richelieu, chief minister to King Louis XIII (1610–1643), was committed to grand political and colonial designs. He created a national navy, and the basis of a profitable empire in the West Indies was laid. Settlement began in French Guiana (1624), Saint Kitts (1627), and Guadeloupe and Martinique (1635).

Disappointed by the poor performance of the successive monopoly holders in North America, Richelieu in 1627 established a chartered company on the Dutch model, the Compagnie des Cent-Associés (Company of 100 Associates). He granted it the rights to the commercial exploitation and colonial administration of New France. It would also hold responsibility for the promotion of settlement and missionary work. When the initial investment and momentum of the company were all but lost as a result of the Kirke brothers' intervention, relief could not come from the Crown. The king faced pressing concerns in Europe, namely its involvement in the Thirty Years' War (1618–1648), the civil war of the Fronde (1648–1653), and the Franco-Spanish War (1653–1659).

Much of the colonial impetus during this period hence belonged to the Catholic Church and to devout laymen and women who provided funds as well as militant personnel. Jesuit missionaries in particular increasingly became valuable cultural and diplomatic agents of France among the Native Americans. Rural settlement progressed along the shores of the St. Lawrence, where the towns of Trois-Rivières and Montreal were founded in 1634 and 1642, respectively. Still, colonial expansion and consolidation in what was to become the heartland of New France remained limited by the hostility of the Iroquois.

When King Louis XIV (1643–1715) inaugurated his personal reign in 1661, he pursued the centralizing policies initiated under Richelieu. He surrounded himself with able ministers such as Jean-Baptiste Colbert, who orchestrated massive financial, industrial, and commercial reforms. In 1663, the Crown assumed direct government of New France, putting an end to the period of company

rule. A follower of mercantilist principles, Colbert believed that external commerce was the source of public finance. To make France a strong contender for overseas trade, he revitalized its navy and merchant marine, and reorganized the colonial administration. He placed it under his personal authority, and eventually under that of the new Ministry of Marine (1669). Contingents of royal troops were dispatched to strengthen the defenses of French colonial holdings in the West Indies, the Indian Ocean, as well as in Canada, where they succeeded in pacifying the Iroquois.

France's territorial claims in North America, as well as its political and economic influence, progressed by leaps and bounds between 1667 and 1685. According to the terms of the Treaty of Breda (1667), France recovered Acadia, which New Englanders had taken a little over a decade earlier. In 1672, Denys de Saint-Simon and the Jesuit missionary Charles Albanel reached Hudson's Bay, where English traders were already active. Louis Jolliet and the Jesuit Jacques Marquette extended French influence to the Mississippi River in 1674. René-Robert Cavelier, Sieur de La Salle, pursued their exploration southward to the Gulf of Mexico in 1682, taking possession of the Mississippi basin in the name of France. He named it "Louisiana" after the king. Through commerce and alliances with various Native American nations, the French were able to exert a loose control over much of the continent. Yet areas of French settlement remained largely limited to the St. Lawrence River Valley and Acadia. Beginning in the 1690s, the policy of the Crown became openly expansionist and aimed at containing Anglo-American settlement east of the Appalachians, within a narrow strip along the Atlantic seaboard.

Louis XIV's reign was marked by a succession of European wars during which Britain emerged anew as one of France's great rivals. Though the two countries were officially at peace, Canadian authorities organized a military expedition aimed at expelling English commercial interests from Hudson's Bay, in 1686. The War of the League of Augsburg, initiated by Louis ostensibly to defend the claims of his sister-in-law in the succession of the Palatinate, quickly extended to the North American theater in 1689 when Britain joined the opposing coalition (King William's War, 1689–1697).

Although the Crown urged an attack on New York during the early years of the war, its commitment to the European front meant that it was unwilling and unable to support a major colonial offensive. Indeed, the naval defeat at La Hogue three years later further undermined France's sea power and contributed to the isolation of New France. Gov. Louis de Buade de Frontenac fell back on an aggressive defense, coordinating punishing campaigns against the Iroquois and spoiling raids against the frontier settlements of New England, and outposts of Hudson's Bay and Newfoundland.

Such reliance on guerrilla warfare and on privateering set the tone for future Franco-British wars in North America. Left to their own devices, and with the assistance of native allies, the authorities of New France could do little more than prevent the mobilization of the enemy's superior resources and manpower until fighting in Europe decided the outcome of the larger conflict. The Treaty of

Ryswick (1697) indeed brought an end to the war and restored the prewar status quo. France recovered Acadia, which had yet again been taken.

The turn of the century brought about a significant shift in French colonial policy. The rising threat posed by Britain and the decreasing value of furs meant that New France was turning into a military and diplomatic frontier above all else. The king and his primary administrators now believed that New France's chief role was to act as a strategic barrier against British imperialism, not to provide economic benefits to the metropole. American Indian cooperation, as always, was of capital importance. The Great Peace of Montreal was concluded in 1701 between France and the representatives of 39 indigenous nations. Included among them was the Iroquois Confederation, which promised to remain neutral in future intercolonial wars. This treaty put an end to the intermittent warfare of the 17th century and marked the establishment of a tenuous Pax Gallica, a turning point in French-native relations. From then on, negotiation was to take precedence over direct confrontation between signatory nations. The French would often intervene as mediators to prevent a breakdown in the alliance.

To defend his grandson Philippe d'Anjou's claim to the Spanish Crown, and animated by the dream of securing hegemony over Europe, Louis XIV went to war in 1701. In North America, where the War of the Spanish Succession was soon extended (Queen Anne's War, 1702–1713), France adopted the same aggressive defense that had proven successful during the previous war. Owing to the neutrality of the Iroquois and bad weather, Canada emerged from the war unscathed. Acadia, however, was not as fortunate.

The 1713 Treaty of Utrecht preserved the balance of powers on the European continent. Louis's grandson ascended to the Spanish throne, but resigned his place in the French line of succession and transferred Spain's lands in Italy and the Netherlands to the Habsburgs. The outcome, however, was disastrous for the colonies, as large portions of New France were sacrificed to maintain French interests in Europe. Hudson's Bay, Acadia, and Newfoundland were ceded for good, though valuable seasonal fishing rights to the northern shore of the latter island were retained. The treaty, and the death of Louis XIV two years later, marked the end of French hegemony in Europe.

According to the terms agreed to at Utrecht, France kept Île Royale and Île St.-Jean (current-day Cape Breton and Prince Edward Island, respectively), which were promptly reorganized as a new colony. The town, and later fortress, of Louisbourg was founded in 1713 and quickly became a successful fishing and trading port as well as an important military base. New Orleans was established five years later, some 4,000 miles away, to provide flank protection to France's Caribbean settlements and to guard the Mississippi, seen as the back door to Canada. Under the regent Philippe II, Duc d'Orléans, and King Louis XV (1715–1774), France pursued its strategy of encirclement of the Anglo-American seaboard colonies.

The French administrators envisioned an arc of territory stretching from Île Royale, through Canada and greater Louisiana, to its colonies in the West Indies. Outside of the St. Lawrence Valley, however, this remained an island empire, an extensive military, diplomatic, and commercial network maintained by a string of posts and forts. As settlement progressed extremely slowly in Illinois Country and Louisiana, the strategic reliance on American Indian alliances persisted. France spent large sums of money for the annual distribution of the king's gifts to the allied nations. Yet the policy of accommodation and appeasement turned to open military confrontation against those who, like the Fox, the Natchez, and the Chickasaws, resisted French influence.

France and Britain's 30-year-long diplomatic and commercial cold war in North America came to an abrupt end in 1744. That year, Louis XV entered into an ill-advised alliance with Prussia and sought to uphold the pretensions of the Elector of Bavaria against those of Maria Theresa of Austria, hoping to weaken the traditional Habsburg foe. The War of the Austrian Succession was transported to the colonies. Once more, France and its Native American allies proceeded to launch raids against English frontier and coastal settlements. The most remarkable incident was the capture of Louisbourg by an expedition of New Englanders. However, by the terms of the Treaty of Aix-la-Chapelle, concluded in 1748, the French regained Île Royale, relinquishing their gains in the Netherlands and the East Indies.

Competing colonial claims to the Ohio River Valley, increasingly penetrated by Anglo-American merchants during the 1740s, made for an uneasy peace. A French military expedition to the region in 1749 brought back the alarming news that diplomatic and commercial influence among the natives was on the wane. This led to the strengthening of colonial garrisons and to the construction of numerous forts.

In 1754, fighting erupted in the Ohio Country. The following year, Louis XV responded to Great Britain's military reinforcement of its colonies by sending a general officer, Jean-Armand de Dieskau, and some 3,000 regulars to Canada. Further reinforcements of 1,000 regulars later accompanied Dieskau's replacement, Louis-Joseph, Marquis de Montcalm. The conflict that came to be known as the Seven Years' War (French and Indian War, 1754–1763) broke out in Europe only in 1756, when France joined forces with Austria and Sweden to crush the rising power of Prussia, attacking the British Mediterranean outpost of Minorca. In North America, the conflict took on unprecedented proportions. The French adopted a strategy that combined guerrilla warfare with traditional European campaign tactics, which generated considerable disagreements between colonial and metropolitan military officers. There were initial successes on Lake Ontario and Lake Champlain, but setbacks soon followed. The personnel and methods of the Ministries of Marine, War, and Finance, were proving sorely inadequate.

In the colonies, the military and the civilian population were increasingly plagued by human and material shortages as the

Crown, reeling from a series of defeats at the hands of the Prussians, remained committed primarily to the war in Europe. The Minister of Marine systematically refused colonial requests for aid, pointing out that one did not try to save the stables when the house was ablaze. By 1758, the British had breached the outer defenses of New France, taking Louisbourg and the forts on Lake Ontario and Lake Champlain. Quebec fell the following year, and Montreal the next. France hastily reinforced Louisiana, its only remaining North American colony. To create a diversion and to gain some leverage at the negotiating table, the French mounted a successful assault on St. John's, Newfoundland, in 1762. However, a swift British counterattack brought an end to the brief occupation.

Peace and a final settlement came with the Treaty of Paris in 1763. France's European boundaries remained as they had been before the war, but France withdrew from its colonial empire in North America, retaining only the islands of Saint-Pierre and Miquelon as well as fishing rights to the waters off Newfoundland. Louisiana had secretly been ceded to Spain the year before, as compensation for its entrance into the war.

Neither the Crown nor the public found much cause to regret the loss of this distant North American empire, which had proven of so little economic value. France, after all, had recovered the lucrative sugar colonies on Guadeloupe and Martinique, as stipulated in the treaty. A handful of high ranking administrators and officers even rejoiced, foreseeing that the withdrawal of the Anglo-American colonists' perennial foe might bring them to rebel against Great Britain. The fulfillment of this prediction would give France a new opportunity to intervene militarily on North American soil in 1778.

France, Army

The defense of France's North American possessions, though in fact ensured by the military assistance of Native American allies, depended on the presence of colonial and metropolitan land forces.

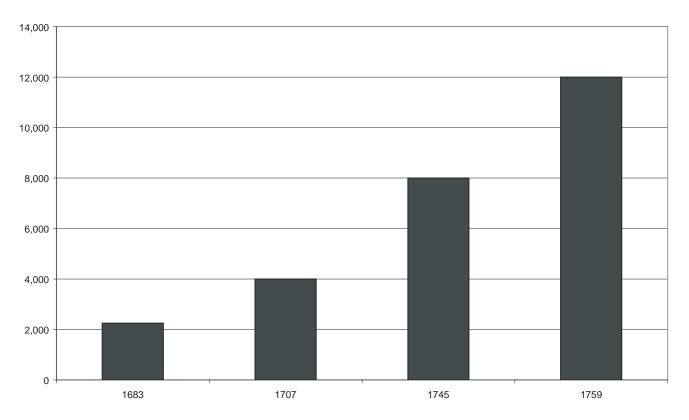

Prior to the middle of the 17th century, however, there were few professional soldiers to speak of in New France. The military burden belonged to colonists and soldiers in private employ. Colonists were forced to fend for themselves against the Iroquois Confederation, because trading companies, missionary orders, patrons, and governors proved unable or unwilling to sustain considerable military expenditures. There were a few notable exceptions. In 1642 and 1644, two contingents totaling 100 men arrived at Quebec. In 1661 and 1662, an additional 200 soldiers were sent to the colony by the proprietary Compagnie des Cent-Associés (Company of 100 Associates). These troops provided some security for Quebec, Trois-Rivières, and Montreal, but they were too few in numbers to take the offensive.

After King Louis XIV (1643–1715) began his personal rule in 1661, military defense increasingly shifted to the militia and royal troops. In 1663, the French Crown assumed direct control of its North American colonies. Two years later, mindful that the Iroquois constituted a serious obstacle to commercial and colonial expansion, Louis XIV dispatched the Régiment de Carignan-Salières, a full regiment of line infantry, some 1,200 men in all. A modern unit for its time, this was one of the first recorded regiments of line infantry in the French Army to be uniformed and to replace all pikes with muskets and bayonets.

Woodcut depicting French soldiers in the early 1700s. (North Wind Picture Archives)

Strength of the Canadian Militia

These troops constructed three forts along the Richelieu River and launched two campaigns against the Mohawks in 1666. When the Iroquois Confederation sued for peace in 1667, nearly 450 soldiers and officers elected to remain in Canada as settlers. Only four companies stayed under arms, reinforced by five more in 1669. The last remnants of the regiment were disbanded in 1671. That left fewer than one hundred soldiers in the colony.

To compensate for this diminished military establishment, in 1669 Louis XIV ordered that the Canadian population be formed into a militia. A number of militias had existed before, but they had been short-lived, localized affairs. The organization drafted during the early 1670s, however, would be maintained until the very end of the French regime. Militia companies generally corresponded to parishes, and were placed under the authority of captains who regularly intervened in the civil administration of rural areas. Every able-bodied man between the ages of 15 and 60 was expected to serve if called on.

Throughout the period, colonial administrators agreed that the Canadian militia was the primary military force of the colony. On paper, it numbered approximately 2,250 in 1683, 4,000 during Queen Anne's War (1702–1713), 8,000 during King George's War (1744–1748), and between 10,000 and 12,000 during the French and Indian War (1754–1763). However, only a fraction of that number could actually be deployed without crippling the economy. In the colonies of Acadia, Île Royale, and Louisiana, the militia was a much smaller and far less significant institution.

The renewal of hostilities with the Iroquois prompted the Crown to send royal troops to Canada once more. In 1683, three companies of troupes de la marine, totaling 150 men, landed at Quebec. These colonial regulars were raised and paid for by the Ministry of Marine and divided into independent companies (compagnies franches). They resembled line regiments in appearance and armament, but were distinct from the metropolitan army, as well as from the marines raised for service aboard the ships of the navy. From the 1680s onward, these colonial regulars permanently garrisoned the colonies.

The number of companies stationed in Canada gradually rose, reaching 35 in 1688, for a total of 1,750 men. Later reductions meant that the colonial military establishment stabilized at about 850 during the first half of the 18th century. As a result of mounting intercolonial tensions, the official establishment was fixed at 1,500 in 1750. Seven years later, the corps reached its maximum strength on paper, with 2,600 men divided into 40 companies.

More modest numbers of troupes de la marine were deployed throughout the other colonies comprising New France. A company arrived at Port Royal in 1685, and by 1702, Acadia was garrisoned by four, totaling 200 men. A detachment of 25 soldiers was sent to Placentia, Newfoundland, in 1687. By 1701, 150 men in three companies garrisoned it.

In the years that followed the Peace of Utrecht of 1713, having lost Acadia and Newfoundland, the French crown was careful to strengthen the defenses of Île Royale. Seven *compagnies franches*

were stationed there beginning in 1713. In 1722, the garrison at the fortress of Louisbourg was reduced to six companies, which were joined the following year by a detachment from the Régiment Suisse de Karrer, a Swiss corps maintained by the Ministry of Marine for duty overseas. Louisbourg fell in 1745 to a New England force during King George's War. When France regained control of it in 1748, 24 companies of colonial regulars were stationed there.

The first French troops stationed in Louisiana were detached from Pierre Le Moyne d'Iberville's ships in 1699. In 1704, two companies of the troupes de la marine arrived in the colony. Louisiana's military establishment gradually rose and fluctuated before being set at 13 compagnies franches in 1732. That same year, a company from the Karrer regiment arrived in the colony. The number of compagnies franches stationed in the colony was drastically raised to 37 in 1750, though these units were significantly under strength, amounting to little more than 1,000 soldiers. New Orleans, Mobile, and Biloxi retained the largest garrisons throughout the period, though detachments were scattered about the posts and forts of upper and lower Louisiana.

Early on, men drawn from the troupes de la marine trained as gunners. At Quebec, an artillery school established in 1698 trained in rotation one soldier from each company. Similar unofficial units sprung up in Acadia in 1707, at Louisbourg in 1734, and at Mobile in 1744. It was only in 1743 that the first corps of colonial artillery, or *cannoniers-bombardiers*, appeared. Formed at Louisbourg, it comprised two officers and 30 artillerymen. After 1750, its strength was increased to 50 men. In 1750, a company of *cannoniers-bombardiers* formed at Quebec for service in Canada; another was formed in Louisiana in 1759.

In the summer of 1755, France responded to the British military build up in North America by sending four battalions of line infantry, or troupes de terre, to Quebec. This was the first direct involvement of the French Army (in the strictest sense of the word, as opposed to the Marine) in colonial defense since the 1660s. These troops, under the successive command of Major General Jean Armand, Baron de Dieskau, and Major General Louis-Joseph, Marquis de Montcalm, were temporarily placed under the authority of the minister of Marine. These two general officers, furthermore, were temporarily placed under the authority of the governorgeneral of New France. Although French and Canadian officers formed themselves into mutually antagonistic factions, relations were much calmer at the level of the private soldiers, who generally entertained cordial relations with the local population.

Over the course of the French and Indian War, a total of approximately 4,300 men belonging to the second battalions of the regiments of La Reine, Languedoc, Guyenne, Béarn, Royal-Rousillon, and La Sarre, and the second and third battalions of Berry, as well as gunners and engineers from their respective corps, went to Canada. The second battalions of the regiments of Artois, Bourgogne, Cambis, and Volontaires Étrangers went to Louisbourg. Finally, a battalion from the Régiment d'Angoumois was briefly stationed in Louisiana.

Each of the battalions serving in Canada, the main theater of operations, initially comprised 12 companies of fusiliers and 1 of grenadiers, corresponding to an average of 31 officers and 525 other ranks. By the last years of the war, however, all of these battalions had fallen to as low as half strength. This shortage of fighting personnel led to the consolidation of *compagnies franches* into battalions and the drafting of militiamen into brigades. A short-lived corps de cavalerie, the first and only mounted unit to serve in New France, served on active duty from May 1759 to September 1760. Composed of 200 Canadian volunteers and 5 French officers, its men acted as scouts and couriers for the army.

On September 14–16, 1760, six days after the capitulation of Montreal, the defeated troupes de la marine and troupes de terre set sail for France. Many deserters and the most severely wounded stayed behind and settled. The French Crown then made a final effort to reinforce France's few remaining American colonies, sending 5,000 troops to Louisiana, Saint Domingue, and Guyana. St. John's, Newfoundland, was briefly occupied during the summer of 1762 by some 750 soldiers, but after the evacuation of Louisiana in 1763–1764, there would be no further French military presence in North America until the American Revolutionary War.

France, Navy

The French Navy played a key role in maintaining lines of communication to the French empire overseas, most notably in North America, the West Indies, and India. The French Ministry of Marine administered New France and Louisiana, and French trade from North America to France relied on the navy's protection. In turn, France and its navy relied on maritime trade for much of its income. The cod fishery off the coast of Newfoundland was highly profitable from the early 16th century onward, as were whaling and the hunting

of other sea animals. As the fur trade became more lucrative, France also needed to protect ocean vessels transporting these items. Most importantly, as France was locked in geopolitical struggles with other European nations, and as these struggles spilled to colonial theaters, a strong navy would enable France to expand its empire and protect its existing colonies while dismantling those of other powers. France failed to fully recognize this fact, however, and continual underfunding of the navy led to the end of French rule in North America.

Naval battles off North America's coast during the 16th and 17th centuries failed to teach French leaders that a weak or absent navy would mean disaster for its overseas colonies. For example, the French built Fort Caroline in 1564 on the River of May (now St. Johns River), populated it with 600 colonists, and left 7 ships for protection. The Spanish, in turn, sent a 10-ship squadron and more than 1,000 troops in September 1565 to defeat the French, capture the fort, and execute the French colonists. Throughout the rest of the century and into the next, France's navy struggled to survive on the seas.

Part of the difficulty in the French competing on the seas, especially with the English, was the fact that France was a major military power in Europe. The French maintained a powerful land army. Throughout this period, Britain, although not as well-off financially as France, had only a small professional army and was thus able to concentrate the bulk of its defense resources in its navy.

By the 1620s the French Navy still lagged far behind the other major European powers, and even some of the smaller ones. In 1624, Louis XIII (1610–1643) advanced Cardinal Louis François Armand de Vignerot du Plessis, Duc de Richelieu, to chief minister. One of Richelieu's major accomplishments was the creation of a French Navy, the consequence of the long siege of La Rochelle. Richelieu, like those before and after him, encountered many obstacles, for few in authority favored a strong navy or overseas empire. They believed that France should instead focus on achieving European domination. Richelieu persevered but, following his death in 1642, the navy was nearly ruined as a consequence of insufficient funding and general neglect.

In the late 17th century, King Louis XIV (1643–1715) rebuilt France's navy, which became, according to historian Jonathan Dull, the most powerful in the world. During the War of the Grand Alliance (1688–1697) a number of naval battles occurred off the coast of Newfoundland and Acadia between the French and the English. After the English defeat of the French at sea in the critical Battle of La Hogue (May 22–24, 1692), the king lost interest in maintaining a large, expensive navy and at sea the French then embraced largely commerce raiding. As a result, much of the navy was demobilized. This trend of construction, followed by demobilization, continued throughout the 18th century.

During the 1700s France's navy was involved in a number of naval contests off the North American coast. New France was economically and militarily largely dependent on seaborne resupply. Strategic sites at the mouth of the St. Lawrence River such as Port Royale and, later, Île Royale, served as maritime gates to New France. During each of the ensuing conflicts with the English, the

French navy was plagued by inexperienced sailors and strategists, manpower shortages, and insufficient funding. These problems were exacerbated by England's ability to focus most of its military assets on its naval force.

During the War of the Spanish Succession (Queen Anne's War, 1702–1713), France lost some of its colonial holdings in North America because its navy was unable to maintain dominance. The English secured key points in Nova Scotia, notably Port Royale. Newfoundland barely held out against English attacks and Quebec was left extremely vulnerable.

Most French naval operations were limited to waters off the coast of France and in the Mediterranean. By the end of the war, the French Navy was in ruins and, by the time Louis XIV died in 1715, it was at less than half the strength it had once been. By the terms of the Treaty of Utrecht, France ceded Acadia, Newfoundland, and Hudson's Bay to Britain, but kept fishing rights off Newfoundland's coast and also received Cape Breton Island (renamed Île Royale) and Île St.-Jean.

After the war, the navy encouraged more settlement on Île Royale and also around the strategically important Bay of Fundy. In 1717, Minister of Marine Jean-Frédéric Phélypeaux, Comte de Maurepas, chose Île Royale as the future site for the fortress of Louisbourg. The fortress, however, was poorly situated and poorly built. The French ministry of Marine was also involved in Canada's interior and sponsored the building of Fort St. Frédéric, Fort Niagara, and Fort Pontchartrain de Detroit. During this time forts were also built in the Louisiana Territory, but not to the same extent as in Canada. Ultimately, France staked its entire North American defense on Louisbourg.

During the 1720s and 1730s French maritime trade increased, although this did not correlate into more funding for the navy. In fact, funding actually decreased because of financial pressures on the Crown in France and a land war against Austria in the War of the Austrian Succession (1740–1748). Furthermore, Louis XV regarded the navy more as a tool with which to invade England or maintain a presence in the Mediterranean, rather than to strengthen French holdings in North America.

As a result, at the beginning of the War of the Austrian Succession, France had only 38 ships of the line, compared to 90 or more for Britain. Fighting also occurred between the British and French in North America. Both sides knew that Louisbourg was the key, and in 1745 a force composed of New England volunteers supported by British warships captured the fortress. After taking Louisbourg, the British were able to drive the French from the Île Royale fishing industry and harass New France's shipping.

The French planned to retake Louisbourg in the navy's sole major expedition of the war. It involved sending to North America a large squadron of 10 ships of the line. In the summer of 1746, the navy assembled nearly 11,000 soldiers and sailors under the overall command of Admiral Jean-Baptiste-Louis de la Rouchfoucauld, Duc d'Anville and, despite difficulties, eventually committed 12 ships of the line to the enterprise. Not even the weather cooperated,

and the ships had to remain in port until June 22, rather than sailing on May 1 as planned. Morale plummeted because it was late in the season, and the planners knew that a prolonged siege at Louisbourg would result in a French disaster. Many, including Michel de Vialis, chief engineer of siege operations, believed that the expedition should be abandoned, but it went forward nonetheless.

In the French passage across the Atlantic, the British took two of the ships, and there were many casualties from disease on the other ships. Indeed, d'Anville died after suffering a stroke in Chibouctou (present-day Halifax), where the French squadron had stopped to resupply. After capturing an English vessel and learning of the presence of a large English squadron in the area, d'Anville's successor decided to call off the attempt and return to France. Locally raised French forces that had been besieging Louisbourg were then forced to call off their effort. Although Louisbourg reverted to French control under the terms of the Treaty of Aix-la-Chapelle in 1748, little was done to strengthen the fortress. Meanwhile, the navy continued to struggle under woefully inadequate funding.

During the French and Indian War (1754-1763; Seven Years' War in Europe, 1756-1763), France made a last effort to protect New France. With only 57 ships of the line compared to 88 for Britain, French naval planners opted for a cautious approach at sea. At first, the navy performed surprisingly well. It lost only 3 ships of the line in 1756 and repelled English attempts on Louisbourg that year and the next. Nonetheless, navy funding was quickly running out as Britain was strengthening its own forces at sea. In the course of 1758 the French Navy suffered many defeats and lost 13 ships of the line. In addition, Louisbourg capitulated on July 26 after a short siege. Most of the navy's ships then left Quebec for France. The navy carried out its last raid in 1762, off the coast of Newfoundland, destroying some British fisheries and shipping. Meanwhile, the British triumphed on land, taking both Quebec and Montreal. In the Treaty of Paris (1763) France lost all its colonial holdings in North America apart from the two small fishing islands of Saint-Pierre and Miquelon.

Even though France had essentially lost its North American empire, the navy, now under the leadership of Étienne-François, Duc de Choiseul, received additional funding and, by the time of the American Revolutionary War, was a match for and ready to engage the British, although it did so mostly off the coast of France. The navy at least played a major role in securing revenge for the defeat of the Seven Years' War, winning the Battle of the Chesapeake on September 5, 1781, that made possible the crushing British surrender on land in the Battle of Yorktown. It was a costly accomplishment; the high costs of the naval war in particular contributed to bankruptcy in France and the coming of the French Revolution a decade later.

Franciscan Order

A religious order of the Roman Catholic Church. St. Francis of Assisi is credited with founding the Friars Minor, the Poor Ladies of St. Clares, and the Brothers and Sisters of Penance, which are generally known respectively as the First, Second, and Third Orders of St. Francis. The Friars Minor dates from 1209, when Pope Innocent III granted unwritten approval of the simple rules that St. Francis had set down for the guidance of his first companions. Franciscans live their lives based on the ideals of poverty, chastity, and obedience. The Friars Minor was the branch that played a prominent role in Spanish colonial history and the spreading of Christianity in the Americas.

Spain's colonial ventures were based on two main precepts. Such enterprises were to facilitate the search for riches to fill the coffers of the Crown and enrich individuals, and they were to convert nonbelievers to Roman Catholicism. The Franciscans, along with the Jesuits, were the prime agents of Spain's missionary aim to convert the natives of New Spain. These orders were prominent actors throughout Spain's rule in the New World. The Franciscans arrived in the New World as early as Christopher Columbus's second voyage there in 1493.

The Franciscans were most prominent in what is now Mexico, New Mexico, Arizona, Texas, and California. To assist in their evangelistic efforts, the Franciscans founded six missionary colleges in Mexico to train friars to reach out to the natives. Franciscans ingrained themselves so deeply into the Spanish Empire that many priests became colonial administrators. Friars accompanied virtually every conquistador foray in the New World. Hernán Cortés appealed to the Crown for Franciscans to evangelize the natives of Mexico in 1522.

Spanish New World conquests were brutal affairs, and their rule after the initial conquest was no less so. The Franciscans were appalled by the acts of the Spanish conquistadors and thus asked the Crown to allow them to rule the natives. Because of their concerns, the Franciscans made tremendous inroads in converting the natives of Mexico to Roman Catholicism. The order opened univer-

Woodcut depicting French Franciscan missionary Father Hennepin and his party exploring the upper Mississippi region as Native Americans observe from the shore, ca. 1680. (The Granger Collection)

sities, hospitals, churches, missions, schools, and other vital social institutions throughout the colony. In addition, friars served as administrators in the colonial government and as advisors to military and civilian officials throughout Mexico. The Franciscans also worked outside the "civilized" core of Mexico.

Friars accompanied Fernando Coronado on his trek into the southwest of the present-day United States. Hopes that the friars might be able to check Coronado's greed-induced abuses proved unfounded. After the expedition returned to Mexico City, however, the Franciscans sent large numbers of missionaries into the recently explored lands, founding missions in New Mexico, Arizona, and Texas. The missionaries alone or in pairs ventured to lands outside of Spain's control without weapons or the protection of troops. The first missionaries lived with the natives, learning their language and at every opportunity seeking converts.

Franciscan missionaries in New Mexico won many converts and built large missions there. Missionaries generally used moral suasion. But when that failed, they could be as harsh as the conquistadors, for the Inquisition was brought to bear on natives who refused to convert or reverted to their former beliefs. Nonetheless, the Franciscans were so successful that they thoroughly controlled

Spanish New Mexico, ruling the colony in the name of the Spanish government. The hinterlands of the isolated colony were dotted with Franciscan missions and their converted charges. These missions were based on agriculture, with friars and "mission Indians" raising crops and livestock.

The Franciscans' heyday in the region came to a bloody halt with the Pueblo Revolt of 1680. The Pueblos of New Mexico had long chafed under Spanish rule. The revolt caught the Spanish completely by surprise, and after bitter fighting and the slaughter of many friars and their native adherents, the Spanish were expelled from the region for 12 years.

However disastrous the Pueblo Revolt may have been, the Franciscans returned to New Mexico to evangelize the natives. The order never again held so much power in the region, but it continued its missionary work. Almost singlehandedly, the Franciscans paved the way for the white settlement of California by converting a large number of natives and building missions throughout the province. This Franciscan push into California also helped ward off Russian settlement there. The Franciscans also worked to evangelize the Apache tribes in Mexico and New Mexico.

326 Franklin, Benjamin

In the 1570s, the Franciscans also accompanied Spanish colonization efforts in Florida (La Florida), which at that point encompassed the southeastern coast from present-day South Carolina into southern Florida. As in Mexico, the Franciscans faced great obstacles there, including the 1597 Tolomato Uprising, which nearly obliterated their presence from northern Florida. After this, however, they had considerable success in Christianizing the natives of northern La Florida, but much less luck in converting those living in the southern third of the Florida Peninsula.

During the first decade of the 18th century, English raids against Spanish missions in La Florida marked the beginning of the end of the Franciscans in Florida. Indeed, by 1735 or so, recurrent English attacks had reduced the order's presence to several small church missions in the vicinity of St. Augustine.

Franklin, Benjamin

Born: January 17, 1706 Died: April 17, 1790

American Patriot, writer, printer, civic leader, statesman, diplomat, scientist, and inventor. Born on January 17, 1706, in Boston, Massachusetts, the 10th son of a soap maker, Benjamin Franklin attended the Boston Grammar School. During 1716–1718, he worked in his father's shop. For the next four years Franklin was an apprentice printer to his half-brother James, publisher of Boston's *New England Courant* newspaper. An avid reader who was constantly honing his writing skills, in 1722 Franklin became a regular contributor to the newspaper under the pseudonym "Silence Dogood." His persuasive writing style served him well throughout his life.

In 1723, after a falling out with James, Franklin went to Philadelphia, where he became a prominent printer. He opened his own printing shop there in 1728 and two years later became sole owner

Benjamin Franklin of Pennsylvania earned worldwide acclaim as a writer, scientist, statesman, and diplomat. He was also a key figure in the American Revolution. (Library of Congress)

of the *Pennsylvania Gazette* newspaper. In 1730, he married, and in 1731 he published his highly successful book, *Poor Richard's Almanac*. Containing information on a wide variety of topics, it was issued annually until 1751.

In 1727, Franklin established the Junto, a club for tradesmen and artisans. Four years later, Franklin and members of the Junto established the Library Company of Philadelphia, America's first circulating public library. In 1736, Franklin became clerk of the Pennsylvania Assembly, and that same year he founded the Union Fire Company. Franklin was appointed Philadelphia postmaster in 1737. In 1743, he launched the American Philosophical Society, an extension of the Junto and the first learned society in the colonies. In addition, Franklin was instrumental in establishing the Masonic lodge in Philadelphia.

Franklin's interests soon extended to politics and warfare. During the 1740s, there was an increasing threat to Pennsylvania from the French and native alliance in the colonies. During King George's War (1744–1748), Franklin's son William fought on the British side against the French and the natives. By 1747, Philadelphia appeared in jeopardy from French and Spanish privateer raids on towns along the Delaware River.

Owing to its pacifist Quaker roots, Pennsylvania was the only British North American colony without a militia. The Pennsylvania Assembly did little about the growing threat, so Franklin wrote a pamphlet, *The Plain Truth*, in which he argued for a militia. He also

outlined a detailed proposal of rules, organization, and training for such a militia, and organized a lottery to raise money for equipment. Ten thousand men signed up in more than 100 companies throughout the colony within weeks of the pamphlet's appearance. Franklin was elected colonel by the officers of the 12 Philadelphia regiments, but declined the offer. Instead, he served as a common soldier, patrolling the batteries built by the militia along the Delaware. The Militia Association disbanded in 1748 with the end of the war.

With peace restored, Franklin turned to other pursuits. In 1751, he proposed the establishment of the first nonsectarian college in America. He went on to raise money to fund such a body, the Philadelphia Academy, which later became the University of Pennsylvania. Franklin served as president of its board. In 1751, Franklin also raised funds for the Philadelphia Hospital. In addition, Franklin established his reputation as a scientist. In 1742, he had invented a stove that bore his name. In 1751, he wrote *Experiments and Observations on Electricity*, and the next year he conducted his famous kite experiment.

Franklin also became active in politics. He was clerk of the Pennsylvania Assembly during 1736–1751. A strong advocate of colonial union and westward expansion, Franklin in 1754 attended the Albany Convention, where he proposed what became known as the Albany Plan of Union. This called for the British colonies to band together and form their own legislative body as well as establish common defensive measures against the native threat. However, local interests prevented the colonies from adopting the plan. Franklin returned home to propose yet another militia, on a purely voluntary basis, with officers elected democratically. Money was raised, and this time the militia was under government control. Franklin, the de facto leader, donned a military uniform and oversaw stockade construction on the frontier. His Philadelphia regiment elected him colonel.

During the 1750s, Franklin took on such civic improvements as street sweeping, paving and lighting, as well as hiring night watchmen funded through a property tax. In 1757, he went to London as an agent for both Pennsylvania and Georgia. He later argued against the 1765 Stamp Act, the first major internal tax on the colonies, passed by Parliament. Franklin helped to secure its repeal the next year. He also argued strongly in the press against the 1767 Townshend duties on goods imported into the colonies.

With increasing tensions between the British government and the North American colonies, Franklin returned to Philadelphia in May 1775, shortly after the battles of Lexington and Concord. Elected to the Second Continental Congress, Franklin proposed the Articles of Confederation. He carried out a number of important assignments, including assisting in the drafting of the Declaration of Independence. Most importantly, in September 1776 Franklin was appointed envoy to France, where he was active in securing secret French funds for use against the British. Lionized by polite Parisian society, Franklin proved an adroit diplomat and, thanks in part to the American victory in the Battle of Saratoga in October 1777, France agreed to enter the struggle openly, recognizing Amer-

ican independence and signing treaties of trade and alliance. Franklin took a leading role in the conclusion of the Paris Peace Treaty of 1783.

Franklin returned to Philadelphia in 1785 and two years later served as a member of the Constitutional Convention in that city. Franklin died in Philadelphia on April 17, 1790.

French and Indian War, Land Campaigns

Start Date: May 28, 1754 End Date: February 15, 1763

The last and largest North American conflict between Britain and France and their respective Native American allies (1754–1763). The French and Indian War began on May 28, 1754, and involved battles on at least three distinct fronts, and served as the catalyst for a wider conflict that came to be known in Europe as the Seven Years' War that began there on August 28, 1756, and ended on February 15, 1763. The war saw fighting on land and sea, not only in North America and Europe, but also in India, West Africa, and the Caribbean. The fighting in North America not only confirmed British hegemony on the eastern half of that continent, but also affected the war in Europe, and set forces in motion that would later influence the American drive for independence.

On August 28, 1753, Robert d'Arcy, Earl of Holdernesse, British secretary of state for the Southern Department (which included North America), sent a circular order to the English North American colonial governors. In it he authorized them to demand a French withdrawal from several disputed territories and, failing that, to force the French out using colonial militia.

Acting on this order, Virginia's Lt. Gov. Robert Dinwiddie dispatched 21-year-old Major George Washington to Fort Le Boeuf, the nearest known French outpost, in what is now northwestern Pennsylvania. On December 16, 1753, Washington arrived with 11 men and was graciously received by Fort Le Boeuf's commandant, Jacques Legardeur de St. Pierre. Although St. Pierre patiently received Dinwiddie's demand to withdraw, he went only so far as to forward the summons to his superiors in Quebec. This set in motion the second clause of Holdernesse's circular order.

Per Capita Debt (in £) after the French and Indian War

On April 15, 1754, the French presence in western Pennsylvania turned from construction to conquest. A force of 500 men under French captain Claude Pierre Pécaudy, Seigneur de Contrecoeur, forced the surrender of 40 English workmen under Ensign Edward Ward, and transformed their Ohio Company trading post into the nucleus of Fort Duquesne at the Forks of the Ohio River. Meanwhile, Washington returned to the frontier with 150 Virginia militiamen and some native allies. On May 28, a detachment of 47 men from this force surprised a party of 35 French and native allies from Fort Duquesne, firing the first shots of the war. Among the 10 French dead was their commander, Ensign Joseph Coulon de Villiers de Jumonville, who received a hatchet blow to the head delivered by Tanaghrisson, leader of Washington's native allies.

While ministers in Britain and France sought to negotiate their differences in North America, the colonists further heightened tensions. Before the news of Fort Duquesne and Ensign Jumonville's death could reach Europe, French captain Louis Coulon de Villiers, Jumonville's brother, led a force of 600 Canadians and 100 native allies against his brother's supposed murderer. Washington's 500-man militia fought from a low, open and rain-soaked set of trenches and palisades known as Fort Necessity, where they were compelled to surrender after a 10-hour fight. Washington's capitulation placed a different spin on Jumonville's death, and when they reached Europe the reported events infuriated French and British ministers alike.

For 1755, both governments planned a proxy war in North America, reinforcing colonial militia with regular European troops. The ministers in London planned one campaign for 1755, but colonial officials requested four smaller ones. The first, during June 2-16, witnessed Nova Scotia't Lt. Gov. Charles Lawrence and Colonel Robert Monckton leading 250 British regulars and 2,000 colonials to Fort Beauséjour and Fort Gaspéreau on the isthmus connecting Nova Scotia to the Canadian mainland. There the British force defeated 150 French regulars and a few hundred unsteady Acadians. On September 8, 1755, Major General William Johnson's operation against Crown Point achieved a defensive victory at Lake George, capturing the French commander, Marechal de Camp Jean Armand, Baron de Dieskau. Major General William Shirley's campaign to Niagara, however, ended at Oswego when supplies ran short and 2,000 colonial militia fell ill. Meanwhile, on July 9, Major General Edward Braddock's expedition to Fort Duquesne ended in the loss of more than 900 out of his 2,200 effectives in the Battle of the Monongahela.

By year's end, ministers in London and Versailles planned new campaigns, expanding operations from North America into the Atlantic, and from the Atlantic to the shores of Europe, where nothing short of a diplomatic revolution had occurred. Maria Theresa, the Habsburg empress of Austria, sought to recapture Silesia, which Prussia had invaded and taken in the War of the Austrian Succession (1740–1748, known as King George's War in America).

Dissatisfied with her ties to Britain under the Third Barrier Treaty (which dated to 1716), Maria Theresa tried to modify its terms. Her demands were so high, however, that the British sought alternatives. Instead of joining an alliance against Prussia, as the empress wished, Thomas Pelham-Holles, First Duke of Newcastle and First Lord of the treasury in London, believed it would be better to bring Prussia to neutrality, and therefore address Austrian security concerns. On January 16, 1756, just as the French were prepared to renew their alliance with Prussia, Newcastle's policy brought about the Convention of Westminster that formalized a vague Anglo-Prussian detente. Outraged, the French and Austrians set aside two and a half centuries of dynastic rivalry and concluded on May 1 the First Treaty of Versailles, a comprehensive defensive alliance. Further negotiations between the two powers formalized the possibility of a substantial exchange of territory: if French financial and military aid enabled Maria Theresa to recover Silesia, then France would be rewarded with sovereignty over the Austrian Netherlands.

Against Prussia, Austria forged the most powerful coalition in the 18th century, for it also included Russia and Sweden. Meanwhile, Britain, which had been allied with Austria in the War of the Austrian Succession, now looked to beleaguered Prussia for help in securing the Electorate of Hanover, the other domain of King George II. Despite this "diplomatic revolution," Britain still opposed France and Prussia still opposed Austria.

In the winter of 1755, as these events were unfolding, France feigned a design for invading Britain while actually preparing operations against Minorca. When officials in London finally discovered the ruse, they dispatched a naval force under Admiral John Byng. The British were unable to prevent the French from taking Minorca, however, and formally declared war on May 18. France reciprocated on June 9.

In July and August, King Frederick II of Prussia, well aware of the powerful coalition forming against him, sent messages to Vienna demanding to know why Austrian forces were massing on the Prussian border and insisting on their immediate withdrawal. Unsatisfied with the response and, without waiting to be attacked, Frederick mobilized his own army and on August 28, 1756, invaded Saxony en route to the Austrian Kingdom of Bohemia. This act began the Seven Years' War in Europe.

There was little in the way of large-scale campaigning in North America during 1756 and 1757. The British commander in chief in North America, John Campbell, Fourth Earl of Loudoun, reorganized British forces, which increased by the end of 1757 to 17 regular regiments and more than 10,000 colonial militiamen. Meanwhile, Maréchal de Camp Louis-Joseph, Marquis de Montcalm, commanded some 7,200 French regulars and as many as 17,000 Canadian militiamen. Whereas Loudoun remained quiescent, aborting two projected British operations against Louisbourg, Montcalm won several important victories and attracted large numbers of native allies to the French cause.

Accompanied by 250 native allies, 1,300 French regulars and 1,500 Canadian militiamen raided Oswego late in 1756, leaving the

British without their trading and logistical base on Lake Ontario. Abandoned by their Oneida allies, the British garrison of 1,135 men was surprised in their poorly constructed works on the afternoon of August 11, and compelled to conclude an ignominious surrender.

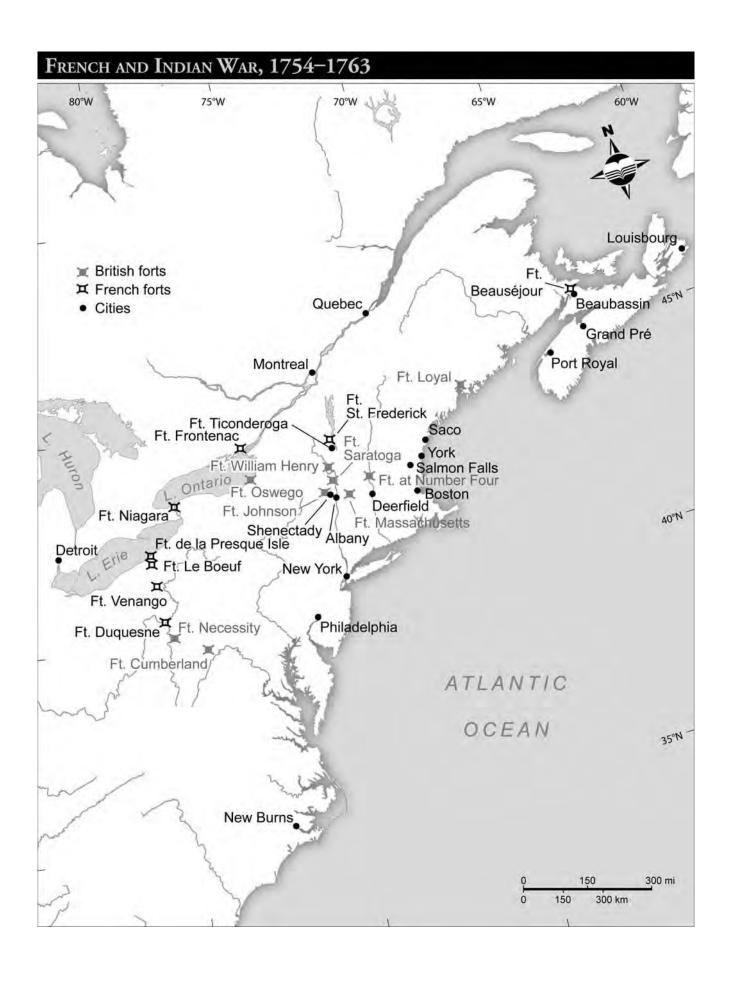

By 1757, the British attempted to gather their own intelligence employing Captain Robert Rogers and his 100-man company of green-clad American Rangers. Discovered and routed in their attempt to reconnoiter Fort Carillon/Ticonderoga in January 1757, the rangers left Fort William Henry as vulnerable to surprise as Oswego had been in 1756, and the prestige of French victories attracted increasing numbers of native allies. In mid-March, a raid on Fort William Henry by Captain François Pierre Rigaud and 1,500 natives, French, and Canadians exposed British weaknesses and destroyed supplies, but Major William Eyre's capable defense saved the fort from immediate capture.

Fort William Henry was in no better shape on August 3 when Montcalm arrived there with some 6,000 French regulars and Canadian militia and 2,000 native allies. British lieutenant colonel George Monro had brought five companies of his 35th regulars to Fort William Henry in the spring and received reinforcements of 200 Anglo-American regulars of the 60th Royal American regiment and 800 Massachusetts militiamen on August 2, giving him a total garrison of 2,300 British and American colonials. This force held out bravely for a week before surrendering.

On August 9, 1757, Monro negotiated a European-style surrender. Granted the full honors of war, the British garrison was assured safe conduct with all of its effects down the 14-mile road to Fort Edward. Unfortunately for the members of the British garrison, Montcalm had not consulted with his native allies. The natives, seeking plunder and scalps, engaged in what the British and colonial press called a "massacre," inflaming public opinion throughout the Anglophone world. Moreover, by trying to restrain his native allies, Montcalm damaged French credibility and gave British Indian commissioner William Johnson an unprecedented opportunity to swing native opinion to Britain's side.

As British fortunes in North America began to improve, the same occurred in Europe. On June 18, 1757, 34,000 of King Frederick's Prussians threatened to drive Austria from the war at Kolín (about 40 miles east of Prague), before their French, Russian, and Swedish allies had fully mobilized. If the Prussians succeeded against Field Marshal Leopold Graf von Daun's 66,000 Austrians, the British hoped to turn Prussian military power against France. Frederick failed, however, and needed near-miraculous victories of his own, near the end of the year.

At Rossbach, in Saxony, on November 5, Frederick achieved the first of these victories. With only about 21,000 men he defeated about double that number of French troops under French marshal Charles de Rohan, Prince of Soubise, and imperial forces under General Feldzeugmeister Josef Friedrich Wilhelm, Duke of Saxe-Hildburghausen. For the loss of only about 550 men, Frederick inflicted more than 10 times that number of casualties on his enemies and sent French and imperial forces into full retreat.

Equally impressive was Frederick's second victory a month later at Leuthen, in Silesia. With some 39,000 men, Frederick confronted about 60,000 Austrians and German allies under Feldzeugmeister Prince Charles of Lorraine. Taking the four-and-a-half-mile-long Austrian line in the flank, Frederick killed or wounded more than 10,000 Austrians and captured 12,000 more, for the loss of only 6,500 Prussians.

These two Prussian victories significantly aided British fortunes in Hanover, where the fighting began somewhat later. In April, George II sent his second son, Captain General William Augustus, Duke of Cumberland, to command British forces there. With the failure of negotiations for neutral status for Hanover, the French invaded it. Cumberland did not offer serious opposition, abandoning a fight at Hastenbeck on July 24–26, 1757, and signing an armistice at Kloster Zeven on September 10.

Following Frederick's victory at Rossbach, Hanoverian forces again mobilized, this time under Field Marshal Prince Ferdinand of Brunswick, one of Frederick's best officers. Throughout the winter and spring of 1758, Prince Ferdinand liberated Hanover, and received British reinforcements through the Prussian port of Emden. In May, Prince Ferdinand crossed the Rhine in Dutch territory with about 32,000 men, and on June 23 defeated about 50,000 French under Marshal Louis, Comte de Clermont, at Krefeld.

The British Army had otherwise been occupied in a series of feints and coastal raids. Combining land and sea power with the persuasive abilities of its diplomats, the British ministry sought to influence Russian and Swedish counsels in the Baltic while confounding defense planners in Versailles and Vienna. Although British expeditions achieved only limited successes, the specter of British troops landing on distant shores kept their opponents guessing and tied down their resources.

Noting the value of naval power and power projection from an early date, Frederick hoped for British aid against Russian sea and land forces in the Baltic region. He did not consider, however, the important trade in naval stores that enriched the Russians and Swedes while providing raw materials for the British Navy. Thus, although the ministry in London ultimately refused to engage in the Baltic, threats of economic damage from fighting with Britain weighed as heavily as that of actual combat on the minds of Russian and Swedish planners. These considerations concerned Austrian planners also; in October 1757, rumors of a possible British raid on Trieste prompted officials in Vienna to dispatch 5,000 troops and a company of artillery there.

In fact, British land and sea forces sailed not to the Mediterranean but to the French port of Rochefort in August and September 1757. This was an attempt to divert the French from their campaign in Germany. Despite achieving almost complete surprise, this raid largely failed because of timidity on the part of the land commander, Major General Sir John Mordaunt. In 1758, with the arrival of new officers such as Charles Spencer, Third Duke of Marlborough, British forces tried again, and conducted more successful landings at the French ports of St. Malo and Cherbourg, where they destroyed large num-

bers of privateers. These raids came to an ignominious end on September 11, 1758, however, with the defeat of a smaller expedition under Major General Edward Bligh at St. Cas. British coastal operations thereafter, until the descent on Belle Isle in 1761, were restricted to naval bombardments.

British ships and troops also conducted amphibious operations in North America and the Caribbean. The first, against Louisbourg, included Major General Jeffery Amherst and Colonel (later Brigadier General) James Wolfe. Whereas Lord Loudoun had failed in 1756 and 1757, the expedition in 1758 succeeded brilliantly, taking the fort on July 26.

Wolfe continued with Vice Admiral Charles Saunders up the St. Lawrence River in 1759. They then waged a lengthy amphibious campaign against the capital of New France, Quebec. In perhaps the most important land battle in the history of North America, the British were victorious in the Battle of the Plains of Abraham outside Quebec on September 13.

British forces had also been busy in the Caribbean. Major General Peregrine Hopson and Colonel John Barrington aborted a planned attack on Martinique, the main French naval base in the region, and instead took the richer sugar island of Guadeloupe on June 25, 1758. Because of resistance from the British planter community, further operations in the Caribbean stalled until 1761, when the British administration under newly crowned King George III considered new conquests as a means of forcing the French to peace, rather than acquiring additional territory.

The British also enjoyed success in the North American interior. With the American Indian threat largely removed by the Treaty of Easton of August 5, 1757, British colonial forces, backed by regular troops, began a large, virtually continuous three-year offensive. Montcalm blunted the English advance at Ticonderoga on July 8, 1758, and French forces under Chevalier Gaston de Lévis almost retook Quebec following the Battle of Sainte Foy on April 28, 1760, but British operations continued to register slow, cautious progress.

British North American forces under the overall command of Major General in North America James Abercromby in 1758, and Amherst from 1759, had great advantages in numbers and organization, and in the quality and creativity of their officers. It was not only Wolfe and Amherst who stood out, but also enterprising officers such as Brigadier General John Forbes, whose attack on Fort Duquesne on September 14, 1758, drove the French from western Pennsylvania; Lieutenant Colonel John Bradstreet, whose attack on Fort Frontenac on August 25–27, 1758, threatened the French Canadian war economy; and Indian Commissioner Major General William Johnson, whose siege of Niagara during July 6–26, 1759, cleared French influence from New York and the western Great Lakes region, and secured British authority over the Ohio Country.

With the fall of Louisbourg and Frontenac, and then of Niagara and Quebec, French trade with Canada collapsed. French maritime businesses fell on hard times. With the cancellation of payment on Canadian bills of exchange, Canada merchants such as Jean-Joseph

Marquis de Laborde—a major financier of the French government itself—were compelled to declare bankruptcy. The Ministry of Marine declared bankruptcy as well in November 1759, and financial problems spread throughout the French government soon thereafter. As French territories in Canada and the Caribbean fell, French subsidies to European allies, notably Austria, dwindled, and French military efforts in Hanover and around the globe weakened substantially after 1760. Meanwhile, the British were able to make regular subsidy payments to Frederick and keep Prussia in the war, although just barely.

Prussia had problems of its own in 1759, particularly after August 12, when Frederick retreated from the sanguinary Battle of Kunersdorf with only 3,000 of the 48,000 troops he had brought to the field. Though he recovered some 30,000 more of his troops by the beginning of September, his capital at Berlin lay open and threatened by 50,000 Austrians. Marshal Daun decided to cover his logistical train instead of advancing, however.

Also in 1759, France made a last gamble at invading Britain, hoping to upset British markets and finance in their turn, if not to end the war outright by a descent on London. By this time, however, the British Admiralty, headed by the capable First Lord George Anson, had perfected a system for blockading and monitoring French ports, cutting off the vast majority of French trade and supply to allies and colonies. France's naval squadrons fared no better than its merchants, with the French Navy suffering major defeats at Lagos on August 19 and Quiberon Bay on November 20.

With the loss of more than 20 ships between the two battles and the concurrent complete collapse of naval finance, the French colonies and outlying islands were more vulnerable than ever. After nearly taking Madras in 1757, the French position in India steadily eroded under British pressure. Lacking adequate supplies for their ambitions in the subcontinent, the last French offensive in India was halted by Lieutenant Colonel Eyre Coote at Wandiwash on January 22, 1760, and the major base at Pondicherry fell a year later on January 13, 1761.

As with French India, the French West Indies had some resources at hand, but could not count on reinforcements and supplies from Europe. When British operations turned from Canada to the Caribbean after the fall of Montreal on September 9, 1760, French islands such as Martinique, Dominica, and St. Lucia could only resist for so long. Throughout 1761 and especially in 1762, the major French sugar colonies fell one after another, until only Haiti on Hispaniola remained.

The last French operation by sea was an assault on Newfoundland in 1762. Though successful, it involved only five ships and 800 men. British colonists in Massachusetts organized a relief expedition of more than 1,500 men under Colonel William Amherst, and soon recovered the island. The French campaign in Newfoundland did not truly envision the conquest of that island as an end in its own right; rather, like the British invasion of Belle Isle with 8,000

men on June 7, 1761, it was an attempt to affect the two states' respective bargaining positions at a future peace negotiation.

The first attempt to start peace talks was the Hague Declaration, presented by British and Prussian envoys in the Dutch Republic to their Austrian, French, and Russian counterparts in October 1759. These negotiations failed, but led to efforts at a peace congress in Breda or Augsburg, in 1760 and 1761. Britain and France also attempted to negotiate a separate peace in 1761, with envoys Hans Stanley and Sieur de Bussy. Negotiations broke down, however, mostly under Austrian and Spanish pressure, and because of concerns over fishing rights near Newfoundland and the return of conquests in Germany. Despite their failure, the talks were restarted through the Sardinian envoys Viry and Solar in 1762, and ended in success near the year's end.

The negotiations in 1762 were more complex than those of 1761 for several reasons. Changes in the leadership in Spain, in Britain, and finally in Russia, altered the international playing field. Spain had slowly edged toward the French camp after the accession of King Carlos III in 1759, and the two states concluded the Third Family Compact on August 15, 1761. With the accession of King George III on October 25, 1760, Britain moved quickly from the hawkish stance of William Pitt the Elder to the more dovish agenda of John Stuart, Third Earl of Bute, and John Russell, Fourth Duke of Bedford.

Finally, with Prussia on the verge of extinction following the Austrian capture of Schweidnitz on October 1, 1761, there occurred the so-called Miracle of the House of Brandenburg. On January 5, 1762, Czarina Elizabeth of Russia died. Elizabeth, who hated Frederick and was determined to end his rule, was followed by Czar Peter III, an ardent admirer of the Prussian king. At the czar's command, the Russian Army switched sides and helped the Prussians to achieve victory at Burkersdorf, on July 21, 1762. Although Grand Duchess Catherine of Anhalt-Zerbst soon succeeded Peter in a palace coup to become Czarina Catherine II, the die had been cast; Russia declared neutrality and Frederick and Prussia survived.

When Russia left the conflict, Sweden also declared neutrality, although Spain declared war against Britain on January 4, 1762. In effect, Europe experienced a second diplomatic revolution, so that Prussia had an advantage over Austria, and France and Spain had what appeared, at first, to be an upper hand against Britain. Although exhausted financially and militarily, Prussia gained several victories in 1762 and forced Austria to accept the definitive loss of Silesia. British and allied forces, meanwhile, invaded Havana, Cuba, and Manila in the Philippines while repelling a Spanish invasion of Portugal.

Finally convinced of the futility of further conflict, France and Spain expanded on the Viry-Solar talks, and found in George III and his envoy, Bedford, remarkable partners for peace. At the prodding of their respective allies, Austria and Prussia made peace at Hubertusburg on February 15, 1763, reaffirming the prewar status quo of

1756 and providing for the definitive secession of Silesia by Austria to Prussia.

Britain, France, and Spain, meanwhile, concluded the Treaty of Paris on February 10. This agreement formalized a substantial exchange of territories, greatly in Britain's favor. In North America it involved the cession of all of New France to British control, excepting only the small fishing islands of Saint- Pierre and Miquelon, and Louisiana, which France ceded to Spain. Britain also acquired Florida from Spain.

By taking large amounts of territory from France, yet leaving important naval stations under French control, Britain left open the opportunity for ministers at Versailles to plot their revenge. This they did until 1770, when the de facto prime minister, Étienne François, Duc de Choiseul, was disgraced by an aging King Louis XV. Meanwhile, Britain had to contend with the difficulties and contradictions inherent in administering their new lands, including the toleration of Catholicism in New France, which was anathema to the Puritan colonists of New England.

Some prominent British officials sought tighter political control over the American colonies, provoking a series of increasingly hostile reactions among the colonists. By 1775, American discontent erupted into full-scale revolt against the mother country, presenting the French with the opportunity for revenge.

French and Indian War, Naval Campaigns

Start Date: 1754 End Date: 1763

Alongside the major land campaigns of the French and Indian War (1754–1763; known in Europe as the Seven Years' War of 1756–1763), Britain and France engaged in major battles at sea. The war saw fleet actions, raids, privateering, blockade operations, and overseas expeditions, all of which contributed to the war's outcome.

In early 1755, shortly after Major General Edward Braddock departed to take his command in North America, the French ministry prepared 18 ships with 78 companies of reinforcements for New France (Canada). On April 23, the British responded by sending out 11 ships of the line and a frigate, all commanded by Rear Admiral Edward Boscawen. Then, on May 8, the Admiralty dispatched another 6 ships of the line and a frigate under Vice Admiral Francis Holbourne. These British ships were intended either to divert or to destroy any effort by the French to reinforce their North American possessions. On the foggy morning of June 4, Boscawen and Holbourne accomplished part of their mission by capturing two French ships of the line—the Alcide of 64 guns and the Lys of the same class but mounting only 22 guns and carrying four companies each of the regiments of Languedoc and La Reine. Despite this success, the British had only hindered the flow of arms from France to Canada and also angered the French government in the process.

The British supported their actions in the North Atlantic with raids against French commerce, by squadrons of 10 to 20 ships of the line under Rear Admiral Edward Hawke in August and September, and Admiral John Byng in October and November. The French government, meanwhile, remained largely passive in the face of this undeclared war at sea, and even returned South Carolina's Gov. William Lyttelton to British custody after his frigate was taken by a French privateer.

Only in December did the French appear to menace British shores with the prospect of invasion—a threat that was in fact a feint to cover a naval descent on the British-held Mediterranean island of Minorca. On April 18, 1756, the Marquis de La Galissonière led 12 ships of the line, 3 frigates, and 173 transports to Port Mahon, the main British post on the island.

These French ships landed 25 battalions of infantry and a siege train—more than 15,000 men in all—under Marshal Louis-François Armand du Plessis, Duc de Richelieu. Despite an order of March 28, Gov. Thomas Fowke of Gibraltar refused to reinforce Minorca with one of his regiments, even after Byng at the beginning of May strengthened the Mediterranean Squadron to 13 ships of the line and 4 frigates. Fowke's disobedience notwithstanding, Lieutenant General William Blakeney, lieutenant governor of Minorca, continued to stifle Richelieu's attempts to take Port Mahon. Byng, meanwhile, arrived off Minorca on May 18 with 13 ships of the line. Two days later, he met Galissonière's 12 ships of the line in the first major naval engagement

of the war. Although Byng attempted new tactics against the French ships, which were generally newer, better manned, and more heavily armed, the battle developed into a stalemate lasting seven and a half hours. After four more days around Minorca, Byng called a council of war that supported his decision to withdraw, leading to Byng's later court-martial and controversial execution on March 14, 1757.

While British forces suffered this setback in the Mediterranean, they strengthened their presence in the Atlantic. Through an energetic building program and improved logistics at sea, Hawke and the first lord of the Admiralty, Fleet Admiral George Anson, gradually perfected a naval blockade of the French coast. In 1757, a partial English blockade rendered French efforts to resupply their colonies both tenuous and expensive. This blockade steadily improved in effectiveness, and by 1758 it prevented the French from mounting any major expeditions from their ports. Privateers and smaller merchant ships occasionally escaped, but the blockade in general proved as effective against French trade as against the French Navy.

The British blockade was supported indirectly by a large number of privateers, particularly from London and Bristol. One of the most notorious of these was the *Antigallican*, a 430-ton, 30-gun ship that took a French trading vessel, the *Duc de Penthievre*, from under the protection of Spanish guns at Cádiz in 1757, and nearly opened an Anglo-Spanish war. After reforms to the Admiralty courts in 1759, privateers were partially integrated into the British Navy, and participated in several minor raids against French ports.

On July 26, 1758, the French fortress port of Louisbourg, on Cape Breton Island, Canada, became the first indirect victim of Anson's blockade. The French garrison there of 10 ships, 3,870 sailors, and 3,920 soldiers had been resupplied at great expense in 1757 but, cut off from further support in 1758, they were unable to withstand a British expedition of about 13,000 British regulars and colonials under Major General Jeffery Amherst, who became commander in chief in North America in 1759. Boscawen supported the army operation with some 14,000 sailors in 23 ships of the line and 16 support vessels. With the fall of Louisbourg, New France lost one of its chief ports and its most expensive fortification in North America.

In Europe, meanwhile, the British Navy achieved a number of impressive victories. On February 28, 1758, a detachment of five ships of the line and two frigates from the Mediterranean fleet under Vice Admiral Henry Osborne surprised three French ships of the line approaching the neutral Spanish port of Cartagena. While the 70-gun *Revenge*, the 64-gun *Berwick*, and two smaller ships captured the 64-gun *Orphée* and forced ashore the 50-gun *Oriflamme*, Captain Arthur Gardiner's 64-gun *Monmouth* dueled with the French 80-gun *Foudroyant* (formerly Galissonière's flagship against Byng). Four hours later, the 64-gun *Swiftsure* joined the fray and the *Foudroyant* struck. Among the French taken prisoner was Rear Admiral Ange de Menneville, Marquis Duquesne, former governor of Canada. Although the British did not retake Minorca, they began to appreciate Governor Fowke's 1756 assessment that Gibraltar was the more important.

In the other colonial theaters, British naval forces also scored important successes. Among these was the expedition of Commodore Henry Marsh and Thomas Cummings, a New York merchant. They sailed with 2 small ships of the line, 6 supporting vessels, and two companies of marines to the west coast of Africa and overran the French slaving station of Gorée in April 1758. Subsequent expeditions in the same year shut down the French slave trade for the remainder of the war. In the Indian Ocean, meanwhile, Vice Admiral George Pocock threatened the French base of Pondicherry with forces rarely numbering above 10 ships of the line and 2 frigates, and he fought several indecisive battles in 1758 and 1759 against squadrons of no more than 9 ships of the line and a frigate under Chef d'Escadre Anne Antoine, Comte d'Aché.

For the British, 1759 was the *Annus Mirabilis*, the year of victories. Principal among these was the capture of Quebec, in which Brigadier General James Wolfe played the leading role. The Royal Navy lent quiet yet indispensable support, however, in the form of 22 ships of the line, 10 frigates, 3 fire ships, 3 bomb ketches, and 119 auxiliary vessels under the overall command of Rear Admiral Charles Saunders.

Arguably of equal importance was the smaller expedition intended for Martinique in the French West Indies, under Vice Admiral Sir John Moore with 10 ships of the line, 5 frigates, and several supporting vessels, and Major General Peregrine Thomas Hopson with three regiments and three detached battalions—in all some 4,800 troops. Captain Richard Hughes left Britain with naval reinforcements for this venture on November 12, 1758, but shortly after he arrived, Hopson died, leaving Colonel John Barrington in command of the land forces. Martinique appeared unassailable, and Moore in any case favored taking Guadeloupe, a major privateering stronghold and the center of the French sugar trade. Following careful reconnaissance and landings at different points of the island, British forces took Guadeloupe by June 25, dealing a major blow both to French privateering in the Caribbean and to their sugar trade.

Most dazzling of all were the British victories at sea closer to home, preempting the threat of a French invasion of Britain. On August 18 near the Portuguese town of Lagos, Boscawen took 14 ships of the line against a French fleet of 12, sinking 3 and trapping 5 more. On November 20, Hawke added his own triumph at Quiberon Bay, near the port of l'Orient, France, commanding 23 ships of the line against 21 under Marshal of France Hubert de Brienne, Comte de Conflans. For the loss of 2 of his own ships, Hawke sent 6 French vessels to the bottom and forced many more into the Villaine River, where some remained as late as 1762. Hawke's victory, in particular, dealt the French Navy a blow from which it would not soon recover and ensured nearly complete British mastery of the sea for the remainder of the war.

France sent two small expeditions to sea at the beginning of 1760, both much smaller than those of the year before. The first, that of five frigates and a sloop under privateer captain François Thurot, was intended for the invasion of England in 1759, but had been diverted to Bergen, Norway (then under Danish dominion),

before continuing around the tip of Scotland. After losing half his squadron to storms in the Faröe Islands, Thurot surprised the small British garrison at Carrickfergus, Ireland, on February 21. Eight days later, he was surprised in his turn by a British force of three frigates under Captain John Elliot. In the 90-minute engagement that followed, all three French ships struck, and Thurot was among the Frenchmen killed. The second French expeditionary force, consisting of one frigate and five large store ships with 400 troops, fared no better. This last reinforcement effort for Canada lost half its ships to Boscawen's patrols near Rochefort, and the remainder arrived near Quebec six days behind British reinforcements from Halifax.

Following this string of failures at sea, France set about rebuilding its navy, but launched only two more expeditions, in 1762. One centered on an attempt to take Newfoundland and involved five ships and 800 men. In the third week of September, this endeavor came to naught, as Colonel William Amherst retook the island with 1,000 regulars and 500 Massachusetts provincials. The other French expedition in 1762 was an attempt to reinforce Martinique, but it arrived only after the island had been taken by the British.

As the war ground to a close, the British ministry, under the leadership of William Pitt the Elder, sought to secure an equivalent for Minorca, then held by the French. The result was an expedition against Belle Isle, in the Bay of Biscay, which fell to the British on June 8, 1761, after a protracted campaign. A larger British expedition also set sail for the Caribbean near the end of the year, and in 1762 took the islands of Martinique, St. Lucia, Grenada, St. Vincent, and Dominica.

When Spain entered the war in favor of France in early 1762, the British undertook two additional naval expeditions. The first, by their Caribbean fleet, took Havana, Cuba, and the second, involving their East Indian squadron, surprised the Spanish garrison at Manila in the Philippines.

By 1762 Britain had achieved complete naval mastery over France and Spain. British command of the sea not only served to protect the British Isles from invasion but also to sever French supply lines and commerce around the globe. The struggle at sea contributed substantially to French financial woes and thus undermined their efforts on the European continent directly against the Electorate of Hanover and indirectly against Britain's chief ally, the kingdom of Prussia. British victories at sea also had an impact on their triumph in the Treaty of Paris that concluded the war on February 10, 1763.

Frontenac, Louis de Buade de, Comte de Frontenac et de Palluau

Born: May 22, 1622 Died: November 28, 1698

Governor-general of New France (1672–1682 and 1689–1698), primarily remembered for having led the colony through King William's War (1689–1697) with a measure of success. Born on May 22, 1622, in Saint-Germain, France, into an influential family of the nobility of the sword, Louis de Buade de Frontenac entered the French Army.

Frontenac fought in the closing stages of the Thirty Years' War (1618–1648). He was commissioned *maître de camp* (colonel) of the Régiment de Normandie in 1643. Crippled in the right arm from a wound he received in 1646, he was promoted to the rank of *maréchal de camp* (equivalent to brigadier general) in compensation. When not on active service, he resided at the court of Louis XIV where he acquired a reputation for his expensive tastes, considerable debts, and colossal vanity. Frontenac served briefly in the French-Venetian campaign against the Turks in 1669, and finally, in the spring of 1672, was named governor-general of New France.

Infamous for both his arrogance and impetuosity, Frontenac had many weaknesses, both as a military leader and colonial administrator. Yet owing to an uncritical interpretation of his prolific and eloquent correspondence by Francis Parkman and subsequent writers, his historical reputation fared extremely well until it was reappraised by his modern-day biographer, William John Eccles.

Shortly after arriving in the colony, Frontenac reorganized the Canadian militia along the lines suggested by the Crown in 1669. During this first term he pursued an ill-advised policy of appeasing both the Iroquois, who harassed France's indigenous allies, and the British, who diverted trade to Hudson's Bay. Having understood the profit to be made in the fur trade, Frontenac promoted westward exploration and the establishment of an advanced post on Lake Ontario (Fort Frontenac), often veiling such commercial ventures as strategic ones. In light of his intemperate behavior, insubordination, and incessant quarrels with the colony's administrators, clergy, and merchants, he was recalled by the Crown in 1682.

As a consequence of his influential family and personal charm, Frontenac was reappointed governor of New France in 1689, shortly after the outbreak of King William's War. During the winter of 1690,

The port of Louisbourg, Nova Scotia, as seen from the headlands above the lighthouse in 1768. (Library of Congress)

Frontenac launched a successful three-pronged raid on the towns of Schenectady (New York), Salmon Falls (New Hampshire), and Fort Loyal (Maine). In retaliation, that same year New England mounted an important naval campaign against Quebec. Prompted by a British emissary to surrender the city, Frontenac famously replied, "I have no reply to make to your general other than from the mouths of my cannon." Outgunned and suffering from cold and hunger, the New Englanders retired to Boston.

This was a decisive victory for the French, but Frontenac's limited resources prevented him from mounting a counterattack. His only major offensive, in 1696, was directed against the Onondagas and the Oneidas. Personally led by the governor, the expedition caused few casualties but did result in the destruction of enemy villages and food reserves. In 1698, Frontenac learned of the Peace of Ryswick of September 1697. In the fall, Frontenac's health declined, and he died on November 28, 1698, at Quebec.

Frontier, Northern

In the 16th and 17th centuries, European colonists continually expanded their land possessions in North America. As each colony grew, conflict with native populations became almost inevitable. Furthermore, longstanding national rivalries in Europe naturally continued in the colonial region. When conflicts erupted in Europe, they usually spilled over into colonial possessions. By the mid-18th century, however, just the opposite occurred—a conflict originating in North America spread to Europe during the French and Indian War (1754–1763).

During almost the entire colonial period, English colonists significantly outnumbered their French counterparts. French possessions along the St. Lawrence River were flanked by British settlements in New England, New York (taken from the Dutch in 1664), and British Canada. British colonists, determined to remain in North America and expand their holdings, experienced more

conflict with natives than did the French, who generally sought a peaceful coexistence with the indigenous tribes. Whereas English settlers tended to push native populations westward as their colonies expanded, in French-claimed territory tribes often remained undisturbed. Because of their more amicable relationship with natives, the French were able to offset many of the population advantages of the British. The French also benefitted from the advantage of interior lines and a unified command. The English rarely coordinated efforts between the differing colonial populations. Each English colony assiduously defended its autonomy, even to the detriment of the British colonial effort as a whole.

As English colonists established themselves in New England, they tended to establish small communities interspersed with native settlements. Relations with neighboring tribes remained fairly harmonious until 1636, with occasional skirmishes but no open warfare. In 1636, a dispute between the Massachusetts Bay colony and the Pequot tribe erupted into war. Fighting continued until May 1637, when an English war party, aided by its Narragansett allies, attacked and burned a Pequot village on the Mystic River. Most of the inhabitants were noncombatants, but all were slaughtered or captured for the slave trade. The English pursuit of total war eventually overwhelmed the Pequots. The 1638 Treaty of Hartford declared the Pequot Nation dissolved. The destruction of the Pequots ensured the domination of the English over remaining tribes in New England, a hegemony that went unchallenged for almost 40 years.

In 1675, conflict again erupted between New England colonists and Native Americans. This time, the powerful Wampanoag tribe was at the center of the hostilities. Chief Metacom, called King Philip by the English, had assembled a confederation of tribes to resist further English encroachment. When an English court ordered three Wampanoags executed for murdering a Christianized native, violence broke out. In the summer of 1675, Metacom's followers attacked Plymouth colony villages, looting and burning, then retreated before the English could mount a response. The Wampanoags were joined by other tribes that had long resented the expansion of English settlements. By autumn 1675, native warriors had devastated the New England frontier and were raiding within 20 miles of Boston. However, the Wampanoags and their allies could not sustain their war effort. They suffered from food shortages, a lack of guns and ammunition, and disease. New Englanders coordinated their efforts and pushed the natives westward. Native leaders who surrendered were executed, and hundreds of their supporters were enslaved to offset the costs of the war. In the summer of 1676, Metacom was killed and his body quartered as a warning to other tribal chieftains in the region. With the loss of his leadership, the Wampanoags were doomed, and the war ended in the autumn of 1676.

The war slowed, but did not halt, English expansion in the region, and virtually destroyed the Native American presence. Several thousand colonists were killed in the fighting, and perhaps

twice as many natives died in the conflict. Those who survived the fighting fled westward, seeking the protection of the Iroquois Confederation, or were confined to four "praying towns" overseen by English colonists.

The frontier between French and English colonial possessions provided the setting for a series of conflicts, primarily struggles for hegemony in, and later dominance of, the North American continent. In King William's War (1689-1697), English colonists in New England and New York, supported by the Iroquois and other native allies, faced off with French Canadian colonists and their native allies. The war was an extension of the War of the League of Augsburg in Europe, and began with raids across the New York-Canada border. A Massachusetts expedition captured Port Royal, Acadia, which had harbored French privateers harassing the New England coastline. In 1690, colonial forces from New England and New York planned a joint invasion of Canada, with armies attacking Montreal and Quebec simultaneously. A smallpox outbreak decimated the English forces, and poor logistics forced both armies to retreat before reaching their objectives. The war devolved into a series of frontier raids and privateering; neither side had the will or the resources to sustain an effort at conquest. By the war's end, militia and American Indian allies on both sides were exhausted and dismayed by the lack of interest displayed in London and Paris. At the Peace of Ryswick (1697), all territories and troops captured in the war were restored to the prewar status quo.

Conflict between France and England renewed in Queen Anne's War (1702-1713), known as the War of the Spanish Succession in Europe. On the northern frontier, colonists and native allies engaged in border skirmishes and raids. New York and the Iroquois chose neutrality over participation, and according to some Massachusetts accounts, Albany merchants bought and sold plunder taken in raids on New England villages by the French and their allies. In 1710, New England colonists assisted by British warships and marines managed to capture Port Royal again, but a 1711 campaign to conquer Canada was actively resisted by Bostonians. Although thousands of colonists enlisted for the campaign, they were poorly trained, provisioned, and disciplined. Most were drawn from outside the ranks of the colonial militias. The Canadian invasion collapsed before it could begin, with British and American commanders blaming each other for the failure. The Treaty of Utrecht (1713) granted the British possession of Nova Scotia, Hudson's Bay, and Newfoundland. These gains, however, resulted from skillful diplomacy and military success in Europe, not from direct

For almost three decades, French and English colonists expanded without conflict. In 1740, the War of the Austrian Succession spilled over into the colonies, causing King George's War (1744–1748). The northern frontier remained mostly aloof from the war until 1744, when French forces attacked Nova Scotia and French privateers began harassing New England shipping. In retaliation, Massachusetts organized an assault on Louisbourg, a mas-

sive fortress protecting French merchants, privateers, and warships in the Gulf of St. Lawrence. Some 2,800 colonial troops from Massachusetts, joined by Connecticut and New Hampshire volunteers, laid siege to the fortress. They were assisted by a British blockade of the harbor, and the fortress surrendered in 1745. The colonists expected British support for another Canadian invasion in 1746; instead, they were left to garrison their prize until 1748. At the 1748 Peace of Aix-la-Chapelle, the British negotiators returned Louisbourg to French control for territory captured by Marshal Saxe in Europe.

In 1754, a colonial war for control of the North American continent began in the Ohio River Valley. Eventually, the French and Indian War (1754–1763) spread to Europe as the Seven Years' War, reversing the direction of previous colonial wars. It resulted in the expulsion of France from North America. In 1754, English colonists outnumbered French colonists by a margin of 20 to 1. However, in spite of superior numbers, English colonies cooperated poorly, if at all. The Albany Convention of 1754 included delegates from seven English colonies, and drafted a plan for mutual defense and diplomacy with native tribes, but it was not accepted by the individual colonial governments. In contrast, the French Canadian colonial effort remained unified under a single commander. Britain and France shipped regulars to North America to assist colonists in securing their frontiers, and soon full-scale war commenced.

For the first two years of war, the British effort was extremely disorganized. English commanders found provincials unwilling to serve under regular officers. Colonists refused to recruit for British regular units, and threatened desertion if forced to serve under royal authority. To preserve their autonomy, colonial units maintained their own supply systems, which proved entirely inadequate. Further, colonial units refused to quarter regulars without the approval of colonial governments. Eventually, the British commander agreed to segregate regular and provincial units and to allow the provincials to provide their own officers. These concessions did little to ease the situation, and the colonies almost never fulfilled British requests for troops, supplies, and transportation. The colonials fighting with the British were for the most part untrained and undisciplined.

The French took advantage of the dissent among the English, and staged a massive offensive along the frontier. In 1756, they captured Fort Oswego on Lake Ontario, and attacked outposts from Canada to the Carolinas. French successes did little to spur colonial cooperation, and the squabbles over the independence of provincial troops continued until 1757. The 1757 campaign season commenced with a French attack on Fort William Henry on Lake George. By the end of the summer, the French threatened the entire Hudson River Valley.

In 1758, British prime minister William Pit dispatched Major General Jeffery Amherst and Brigadier General James Wolfe to assume command of the North American war effort. Amherst, a conservative but persistent commander, was complemented by Wolfe, an aggressive officer with a reputation for training daring and well-disciplined troops. Amherst and Wolfe decided on a series of three offensives against the French. They personally led attacks on Louisbourg and Quebec while Major General James Abercromby attacked Montreal and Major General John Forbes forced the French to evacuate Fort Duquesne. More than 20,000 British regulars, supported by an equal number of provincials, 40 warships, and more than 10,000 sailors demonstrated that the British wished to field an overwhelming force.

The attack on Louisbourg, although successful, required a six-week siege, forcing the cancellation of an assault on Quebec. The other offensives fared poorly, Abercromby's advance on Montreal foundered at Fort Ticonderoga, and Fort Duquesne did not surrender until November. The planned conquest of Canada remained delayed until 1759, when Amherst planned to lead an army of provincials and regulars against Montreal while Wolfe assaulted Quebec with a similar army.

The French used the location of the city atop a bluff overlooking the St. Lawrence River to assist in its defense. They deployed forces along the bluff east and west of the city to prevent a siege of Quebec. British probing attacks failed to dislodge the French defenders, and efforts to flank their line proved futile. Wolfe then devised a plan to land attackers at the base of the bluff. Before dawn on September 13, 1759, Wolfe landed 4,800 troops, moved them up the face of the bluff to the Plains of Abraham, and assembled his forces in line of battle outside the city. French commander Lieutenant General Louis-Joseph, Marquis de Montcalm, decided to attack Wolfe before the British could dig in for a siege. In the ensuing Battle of Quebec, the British routed the French defenders, although Wolfe was killed in the fighting. Quebec surrendered on September 18, 1759.

Amherst's advance on Montreal was delayed by the provincials' slow mustering and by the need to sweep aside French resistance on Lake George and Lake Champlain. By October, he had forced the evacuation of Fort Ticonderoga and Crown Point, but it was too late in the season to proceed to Montreal. Amherst recruited colonists for a final invasion of Canada in 1760. By the time spring arrived, he had assembled a force of over 18,000 regulars and provincials to assault Montreal from three directions. Finally, on September 6, his forces reached Montreal and compelled the French to surrender on September 8, 1760.

At the Peace of Paris (1763), the British negotiated to keep Canada and expel France from North America. This permanently secured the northern frontier for the British colonies in America. Although conflict with Native Americans in the region remained likely, the native tribes would no longer enjoy the direct support of the French government, and would face increasing supply difficulties in any Anglo-native conflict.

In May 1763, the northern frontier became the scene of violent conflict when the Ottawa leader Chief Pontiac launched a series of coordinated native attacks on British posts in an effort to drive the British from native territory. Despite some significant early successes, Pontiac's native alliance failed to oust the British. In order

to maintain peace on the frontier, the British government issued the Proclamation of 1763, forbidding colonial settlement west of the Appalachian mountains.

The northern frontier region proved to be an important theater of the American Revolutionary War (1775–1783). The first skirmishes of the war occurred in New England, and New York City served as the headquarters of the British armies in North America for most of the war. The surrender of British forces at Saratoga on October 17, 1777, which ensured French intervention in the war and turned back a British attempt to control the entire Hudson River Valley, is regarded by many historians as the most significant event of the war. After the American Revolutionary War, the region again became a frontier, between the newly formed United States and British-held Canada.

Frontier, Southern

The southern colonial frontier comprised the lands in the interior of the southern portion of the North American continent. This land stretched from the Ohio River to the Gulf of Mexico and emerged as a politically and economically significant region during the colonial period. This was due chiefly to Native American, French, and English rivalries. Politically, many of the colonies, by their charters, extended farther inland from the coast and competed for control of both Native American trade and Native American land. The protracted struggle between England and France on the North American

can continent influenced each country's relationship with Native Americans, who held the balance of power for considerable periods.

Southern Native Americans were more numerous than Native Americans living north and east of the Ohio River. The Creeks and the Cherokees comprised the largest Native American groups in the Southern frontier. By 1750, the lands of the Creek confederacy, which included the Upper and Lower Creeks and the Seminoles, extended from the Alabama River to the west, to the Ogeechee River to the east. The lands also included most of the Florida Peninsula. The Creeks claimed the lower part of the triangle between the Alabama River and the Tombigbee River; however, the Choctaws disputed possession of this area. Comparatively, the Cherokees were located in the lower settlements of the Koowee River and Tougaloo River, the middle towns on the upper reaches of the Little Tennessee River, and the valley settlements located north of the Hiawassee River and the Overhills. During the 18th century, the Creeks withdrew from contact with Europeans and relied on Native American buffer groups. These tribes were strategically placed between the Creeks and the colonists, to serve as agents for Creek trade with the English colonists. Conversely, placed in closer contact to the English frontier, the Cherokees endured the unscrupulous tactics of traders and frontiersmen, and consequently suffered during the 18th century.

Other Native American groups who played minor roles in the colonial Southern frontier were the remnant Tuscaroras who inhabited the frontier of North Carolina until 1769. Also playing minor roles were the Yamasees who had been forced to retreat into Florida following the Yamasee War, and the Alabamas, who had lived along the Alabama River and who were affiliated with the Creeks prior to 1760. The Catawbas, the Choctaws, the Chickasaws, and the southern Shawnees were also minor players in the drama of North American politics during the last generation of British rule in the southern colonies.

Native Americans living in the southern frontier maintained large and powerful government structures. For example, Creek political structure consisted of a highly developed confederation with annual council meetings of 4,000 to 5,000 officials and as many as 12,000 Creeks. In the pending conflict between England and France, Native Americans, particularly the Catawbas, often provided assistance in the defense of the southern frontier.

By 1750, the Catawbas were able to resist the assaults of their enemies, notably the Iroquois, despite their small numbers. Incessant raids by war parties from the Iroquois Confederation and from other Native American groups in alliance with France had challenged Catawaba strength. Although their numbers had increased through accretions from other South Carolina groups before the midcentury, the Catawbas were threatened with extinction. Yet, they had served as a stout bulwark protecting South Carolina from invasion. In the colonial conflicts between France and England, the Catawbas were able to furnish valuable assistance in the defense of the Southern frontier.

340 Frontier, Southern

French policy toward Native Americans consisted of fraternization and gradual infiltration. The fur trade expanded French influence along the Gulf of St. Lawrence and the Gulf of Mexico. From 1729–1731, the French waged a campaign to expel the Natchez in Louisiana. The French, however, were weaker than the English in the South. By the mid-18th century, Louisiana's European population numbered only 6,000 out of a total population of 25,000. Theoretically, the French government provided assistance to Louisiana by maintaining 1,850 trained troops in the *corps de Louisianne*. However, in practice, only a small number were outfitted for duty, and these men were scattered throughout a wide area.

In diplomacy, one of the advantages held by the French, and not the British, was their alliance with Native Americans. Many southern Native Americans preferred the relative nonexpansionist tendencies of the French. However, the French never gained the loyalty of the Chickasaws, the Catawbas, or the Cherokees, all of whom aligned with the British, and the Creeks generally remained neutral. Comparatively, the English were at a disadvantage in Native American relations because of shortcomings in diplomacy and because of their expansionist tendencies. Yet through their mastery of southern Native American trade, the British offered Native Americans higher quality goods at lower prices for the deerskins and furs that

Native Americans sold to them. Trade with southern Native Americans was unquestionably lucrative. Exports of deerskins from Charles Town (present-day Charleston, South Carolina) during 1731–1765 never fell below £150,000 until the outbreak of the French and Indian War (1754–1763). English trade, though economically important, was of greater political consequence. It was a formidable weapon in the hands of the British and yet also a threat to their safety.

During the early 18th century, population increases in the mid-Atlantic and southern colonies led to British expansion into the back-country, or interior. As the last major area of agricultural land available for settlement east of the Appalachian Mountains, the back-country emerged as the continent's most dynamic agricultural frontier by the 1770s. The Piedmont regions of Maryland, Virginia, the Carolinas, and Georgia underwent dramatic population increases from the 1720s to the 1770s. Indeed, by 1780, the population numbered 380,000.

Families that migrated to the southern backcountry arrived in two migrant streams, one from the Tidewater (or coasts) and the other from the mid-Atlantic colonies. These populations merged in the southern backcountry to create an ethnically diverse population that included Germans, French Huguenots, Scots-Irish, and Lowland Scots. As European and American settlers expanded into the southern frontier, they encountered remnants of Native Americans, survivors and refugees from earlier conflicts along the seaboard. The Native American groups scattered across the Piedmont included the Catawbas, who fought with the British against the French in 1759.

During the colonial period, settlers acquired land in the back-country from the Crown under the headright, treasury right, or military right systems. Additionally, purchases from speculators who owned large patents also allowed settlers to acquire land there. Whatever their background, immigrants settled on dispersed lots, created mixed farms, learned English, and participated in local institutions. The distinctly American rural world that had been taking shape in the mid-Atlantic colonies was further refined and enhanced in the backcountry. After the American Revolution, this cultural and economic system began to leap the Appalachian Mountains, which would bring white settlements to such areas as Ohio, Indiana, Kentucky, Tennessee, Alabama, Illinois, and Michigan.

G

Gage, Thomas

Born: ca. 1719 Died: April 2, 1787

British general and North American commander in chief (1763–1775) and governor of Massachusetts (1774–1775). The second son of an Irish peer, Thomas Gage's exact birth information is obscure, but he was born in late 1719 or early 1720, possibly in Highmeadow, Gloucestershire. He attended Westminster School during 1728–1736, where he met a number of individuals who would be influential in his later military career. Gage received a commission as an ensign in the army sometime during the period 1736–1740. In 1741, he was commissioned a lieutenant in the 48th Foot. The next year he was a captain lieutenant in the Irish establishment and in 1743 he received promotion to captain with the 62nd Foot.

Gage was an aide-de-camp to Lord Albemarle during the War of Austrian Succession (1740–1748) and was present at the Battle of Fontenoy in 1745. He also took part in the Battle of Culloden during the Jacobite Rising of 1745 and served in Flanders during 1747–1748. From 1748 until 1755 Gage served in Ireland, where he was promoted to major of the 55th Regiment in 1748. Three years later he was promoted to lieutenant colonel of the same regiment, now renumbered the 44th.

Known as "Honest Tom" to his friends, Gage seems to have been the exception in the British Army of his day, for he did not drink to excess, gamble, or take advantage of women. He seems to have had the reputation of being a sober, effective, and popular officer and an excellent conversationalist.

With the outbreak of the French and Indian War (1754–1763), Gage went to North America in early 1755 as lieutenant colonel in

Lieutenant General Thomas Gage was commander in chief of British forces in North America from 1763 to 1775, and governor of Massachusetts from June 1774 to June 1775. Directed to suppress the growing forces of rebellion, in April 1775 he ordered the march to destroy stocks of munitions at Concord that began the American Revolutionary War. (Library of Congress)

the 44th Regiment, part of the force under Major General Edward Braddock charged with taking Fort Duquesne from the French. Gage commanded the 300-man British vanguard in Braddock's disastrous campaign into the Ohio Valley in 1755. On July 9, Gage's force was simply overwhelmed by the French and natives in an

ambush position and forced to fall back on the main column. His colonel, Peter Halkett, was among those killed and Gage was wounded slightly several times. Although some questions were raised about the deployment of his men, Gage received praise for his courage and leadership under fire.

Taking over command of what was left of the 44th, Gage spent the winter of 1755–1756 in Albany, New York. In the summer of 1756, he was second-in-command to Brigadier General Daniel Webb in an unsuccessful campaign in the Mohawk Valley to defend Oswego from the French. Before the British could reach Oswego, it fell to French forces under Major General Louis-Joseph, Marquis de Montcalm. Gage then returned to Albany for the winter of 1756–1757.

Gage became known for keeping his regiment in fighting shape and disciplined, while at the same time not alienating the men. He soon attracted the attention of new British commander in chief in America, John Campbell, Earl of Loudoun, who became his mentor and took Gage on the unsuccessful British expedition to capture the French fortress of Louisbourg on Cape Breton Island in 1757.

In December 1757, Loudoun authorized Gage to raise a regiment of provincial troops, known as the 80th Foot, which would serve as light infantry, modeled after the colonial rangers and more able to engage and fight Native Americans. It was the first such regiment in the British Army and Gage paid for much of their equipment himself.

In the summer campaign of 1758, Gage commanded the vanguard in Major General James Abercromby's unsuccessful attack on France's Fort Carillon (later Fort Ticonderoga) and was again wounded while leading his troops against the entrenched French. On the death of George Augustus, Lord Howe, Gage became second-in-command during the British retreat, receiving promotion to temporary brigadier general.

In September 1758, Abercromby was dismissed. His replacement as commander in chief in America was Major General Jeffery Amherst, an old friend of Gage. In December 1758, Gage married Margaret Kemble, daughter of a prominent New Jersey merchant and landowner.

Amherst planned a three-pronged attack against the French strongholds to culminate with the capture of Montreal. In this campaign, Amherst, assisted by Gage, would take Fort Carillon and move north on Lake Champlain toward Montreal. The other two prongs were under Brigadier General James Wolfe against Quebec and that commanded by Brigadier General John Prideaux from the Great Lakes toward Montreal. When Prideaux died accidentally, Amherst sent Gage to replace him. In this, his first independent command, Gage received permanent promotion to brigadier general that July.

Gage's instructions were to capture La Gallette (Ogdensburg) on Lake Ontario then move against Montreal. He proved overly cautious and neither took La Gallette nor moved on Montreal. Believing his resources to be insufficient for such a task, he instead strengthened two British forts: Ontario and Niagara. An angry Amherst recalled Gage and placed him in command at Albany, a

rear area. Regarded as a talented administrator, Gage nonetheless proved cautious in battle, perhaps as a result of his earlier experiences under Braddock and Abercromby. In 1760, Gage commanded the rear guard in Amherst's capture of Montreal.

Appointed governor of Montreal by Amherst, Gage held that post until 1763 and proved a most effective administrator, who got along well with the French. He received promotion to major general in 1763, and when Amherst departed in November 1763, Gage took over as temporary commander in chief of British forces in North America. When Amherst did not return, Gage was confirmed as permanent commander in November 1764.

The most pressing issue demanding Gage's attention was the outbreak of Pontiac's Rebellion (1763). Gage assigned this task largely to his able subordinates colonels John Bradstreet and Henry Bouquet. In 1770 Gage was advanced to lieutenant general.

While Gage was personally popular with his officers and in New York City society where he made his headquarters, these were years of growing unease in British North America, caused by such measures as the Stamp Tax. Alarmed, Gage shifted most of his 6,000 troops from the frontiers to the seaboard and especially to Boston, the center of growing colonial unrest. Gage was firmly committed to maintaining British sovereignty and the rule of law but he also sought to apply British law so as not to inflame an already volatile situation.

In June 1773, Gage returned to Britain for the first time in 17 years. The deteriorating situation in America, especially the Boston Tea Party in December 1773, forced his return in May 1774, with the additional position of military governor of Massachusetts. Before departing England, Gage met with King George III and expressed the view that British policy toward America had not been sufficiently stern but that the four regiments assigned to Boston would be sufficient to maintain order there.

Unable to perform his preferred approach of attempting to please both sides at once, Gage also found the task of maintaining order in Massachusetts beyond the means available to him. Although Gage did send troops to seize powder stocks at Cambridge and order reinforcements to Boston, he was unable to quell unrest in Boston over the Massachusetts Government Act of August 1774.

Increasingly also Gage's own officers and men criticized his reluctance to use military force. In April 1775, Gage received orders from London to take the offensive in forcing the rebellious colonies to submit. This led him to order the April 19 operation to seize stocks of arms and powder at Concord, which prompted the outbreak of the American Revolutionary War. Nonetheless, Gage demonstrated a marked reluctance to apply his forces offensively, and this led to his recall to consult with the government in London.

Gage departed Boston with his family in October 1775, never to return. In April 1781, he was appointed to the staff of General Jeffery Amherst to assist in organizing the defenses of Kent to meet a possible French invasion. Promoted to full general in November 1782, Gage died at his home, Portland Place, in London on April 2, 1787.

Gardiner, Lion

Born: 1599 Died: 1663

New England military engineer. Born in England in 1599, Lion Gardiner served for a time in the English Army and then journeyed to the Netherlands, where he joined the army of the Prince of Orange. Over the years, he became expert in the design and construction of fortifications. In Rotterdam, Gardiner met two Puritan ministers, the reverends John Davenport and Hugh Peter, who in 1635 offered him an annual salary of £100 for four years of work on the defenses of New England.

Gardiner accepted the offer and traveled to North America via London, arriving in Boston in November 1635. He immediately set to work, determining that Salem in Massachusetts Bay did not need to be fortified and then assisting in constructing a fort on Breed's Hill near Boston. The following spring, he traveled to the mouth of the Connecticut River, where he supervised construction of Fort Saybrook. This timely move forestalled a Dutch plan to occupy the area.

The fort proved of even greater value when the Pequot War broke out shortly afterward. Gardiner disagreed with Massachusetts officer John Endicott's policy of stripping Fort Saybrook of troops to pursue the Pequots, a concern that proved justified when the Pequots attacked Fort Saybrook in early 1637. Gardiner was wounded in a successful defense of the fort. He then joined with Captain John Mason and Captain John Underhill in planning the spring campaign against the Pequots, which culminated in the 1637 destruction of Mystic Fort. Gardiner himself did not participate in the campaign, but contributed 20 men from Fort Saybrook's garrison to the colonial force.

After the war, Gardiner developed a friendship with Wyandanch, chief of the Montauks, who inhabited Long Island. In 1639, on the expiration of his contract with the New Englanders, Gardiner purchased a small island off the eastern end of Long Island (since called Gardiner's Island) from the Montauks for a small quantity of

cloth. He also obtained title to the island from English officials. Remaining on good terms with the Montauks, he assisted them in defending against Narragansett raiding parties that sometimes crossed Long Island Sound. Gardiner even convinced Massachusetts officials to send a vessel to prevent such raids.

Gardiner moved to Easthampton, Long Island, in 1653, but eventually returned to his island, where he died in 1663, three years after writing a history of the Pequot War.

Garrison Houses

A variety of fortified structures, usually private dwellings, used for local defense against native or French attack in many backcountry settlements of colonial North America, particularly in frontier communities. Until the large-scale presence of British regulars in America in the 1760s and an American standing army after the American Revolutionary War, American colonists depended on homemade, and often makeshift, military measures for defense. In addition to the militias and permanent forts and blockhouses, colonists used garrison houses, which could be found in virtually any settlement or village in North America, for defensive purposes.

In frontier areas, north and south, garrison houses served as the first line of defense for many colonists. Militias existed within towns and counties, but it took time to alert and form them into an effective body to repel attackers. In the case of sudden attacks or raids, the militia was largely useless except as a pursuing or relief force. In contrast, garrison houses offered a form of immediate assistance as a refuge from attackers.

Armed inhabitants and occasional provincial soldiers stationed in garrisons would attempt to repel attackers until militia forces in nearby towns could form and march to relieve the besieged town. Garrisons were only effective, however, if inhabitants could get inside, and this required advance warning, remaining close to the garrison in times of trouble, and a bit of luck. Once inside, inhabitants were relatively safe because Native Americans were reluctant to suffer the casualties necessary to storm a fortified position. Nevertheless, on numerous occasions, natives constructed ingenious contraptions from wagons, timber, and combustibles to attack the house and force the defenders into the open. As settlers crowded into garrisons, they could track the progress of raiders as they burned outlying farms as well as undefended buildings within the settlement itself.

Garrison houses had other problems as well. With dozens of people assigned to or seeking shelter in relatively small buildings, settlers had to adjust to sharing a very restricted space with neighbors as well as provincial soldiers for extended periods of time. This frequently led to disputes between civilians and soldiers. In addition, garrison houses often lacked sufficient supplies and water to sustain their occupants for any extended period. Hygiene and sanitary conditions were often compromised when the garrison house was at or beyond capacity. As people emerged from the shelter to gather food, firewood, water, or attempt to maintain their own property, they became prime targets for raiders.

The term "garrison house" never implied a particular sort of structure, merely the purpose of the building as a refuge or base for defensive operations. Garrison houses could be private homes, conveniently placed barns, or, more commonly, the local home of a minister, militia officer, or town official. As a private structure, the upkeep of these buildings was usually the responsibility of the owner, thus relieving governments of additional expenses. However, colonial governments frequently appropriated funds to fortify private buildings, as Virginia and Pennsylvania did during the French and Indian War.

The number of garrisons required within towns and counties was never officially established. Instead, the abundance (or paucity) of garrison houses depended on the circumstances, and sometimes the whims, of each locality. If a township bordered the banks of a river for several miles, such as Salmon Falls, New Hampshire, the town might have five or six garrisons to accommodate its widespread inhabitants. In contrast, a small town such as Brookfield, Massachusetts, had just one building designated as a garrison, the local tavern owned by John Ayres.

Not surprisingly, the construction of these buildings varied as widely as did their peacetime purposes. Some were single houses of squared or sawn logs, or even of standard frame construction. However, as conflict with Native Americans and rival European imperial powers increased in the late 17th and early 18th centuries, garrison houses took on more elaborate and complex forms. Some buildings, especially those designed specifically for garrison duty, were constructed from thick timbers to resist the penetrating power of smallarms fire. Colonists would strengthen doors and windows as well as cut loopholes in the walls for the defenders' muskets. Some garrisons incorporated a roofing plan designed to protect the building and inhabitants from fire. While builders constructed the roof from light materials, they would build the attic floor from thick timbers and cover these with layers of ash or sand. If the roof was set afire, which native and French raiders were apt to do to force out the defenders, the attic floor would serve as a fire break. Other garrisons quickly became small forts as inhabitants surrounded the garrison (and sometimes nearby buildings) with palisades—or walls—of logs eight or more feet in height. These garrisons often acquired fortified gates and even flankers, timber towers on the corners of the palisades that provided defenders with a vantage point to watch for raids or attacks.

Gaspée, Burning of the

Event Date: June 9, 1772

British ship attacked and burned by American colonists near Providence, Rhode Island, on June 9, 1772. In March 1770, the British Parliament repealed the contentious Townshend Revenue Acts of 1767, save for the tax on tea. But colonists still looked to skirt the tea tariff, resulting in a lively and ever-expanding illicit trade of that commodity. The colonists accomplished this mainly by smuggling and sometimes even working through corrupt British customs officials.

Colonial merchants and traders frequently clashed with overzealous customs collectors, especially in Rhode Island, where such importation illegalities ran most rampant. Indeed, mobs were alleged to have sunk a pair of small Royal Navy vessels in 1771, resulting in the dispatch of the schooner *Gaspée* to Rhode Island in late March 1772.

Commanded by Lieutenant William Dudingston, who was described by Rhode Islanders as imperious and haughty, the *Gaspée*'s crew stopped ships and often seized their contents without due cause, fired on unarmed market boats in and around the port of Providence, and seized colonial vessels suspected of smuggling. The situation became sufficiently tense that the constable of Providence threatened to arrest Dudingston. At the same time, British commander in North American waters Rear Admiral of the Blue John Montagu threatened to hang as a pirate anyone who attempted to interfere with official antismuggling efforts. Rhode Island governor Joseph Wanton wrote to Montagu informing him that he considered Dudingston and his crew nothing more than pirates in their own right.

On June 9, 1772, the *Gaspée* ran aground on a sandbar not far from Providence, while pursuing a suspected smuggler. That night, a mob of some 150 people took the schooner by force. Dudingston, who received a bullet in the groin while trying to defend his ship, was taken forcefully ashore. When the crew evacuated, the colonists proceeded to set the vessel on fire. It then burned down to the waterline.

Dudingston was subsequently court-martialed for losing the ship. Meanwhile, a royal investigative commission failed to identify those who had taken part in the affair and also exonerated the Rhode Island government of any wrongdoing. The incident, how-

George II, King

Born: November 10, 1683 Died: October 25, 1760

King of Great Britain and Ireland (1727–1760). George II ruled during a period of stupendous growth that saw Britain become the

world's leading commercial and naval power as it expanded its empire around the globe. Known as Britain's last warrior king, George was more of a soldier than a statesman, although he and his gifted ministers successfully guided the country through three wars and established the country's sound economy.

Born in the small German electorate of Hanover on November 10, 1683, George Augustus was the son of Prince George and his wife Sophia Dorothea. At the time of George's birth, his father was the heir to Hanover. On September 2, 1705, George married Caroline of Anspach. A bright and intelligent woman, she came to dominate her husband, particularly in affairs of state.

As a young man, George preferred military life to academics or statecraft. In 1708, he volunteered for service with the British during the War of the Spanish Succession, distinguishing himself by leading a cavalry charge at the Battle of Oudenarde. The direct royal line in Britain was near extinction, because both Queen Mary and Queen Anne failed to produce heirs. When Anne died in 1714, the British throne passed to George II's father, who ascended the British throne as King George I. On June 11, 1727, George I died, and George was crowned King George II. He immediately made plans to sweep away his father's government and install his own supporters, known as the Leicester House set.

George II, king of Great Britain and Ireland (1727–1760). During his reign, the kingdom grew substantially in wealth and power. (Library of Congress)

A war with Spain that began in 1739 was compounded by the War of the Austrian Succession (1740–1748). Britain remained out of this wider conflict until 1744, but in 1743, George took the field at the head of the Hanoverian soldiers. He won a narrow victory at the Battle of Dettingen on June 27, 1743, at one point dismounting his horse personally to lead the infantry onto the field. In 1745, George suppressed a domestic challenge to his authority, the Jacobite Rising.

George II formed a number of alliances with politicians who prosecuted the war. In 1746, however, he was faced with a large-scale rebellion from within his cabinet that challenged the very core of his authority. At issue was the appointment of the rising young politician William Pitt (the Elder) to a ministerial post. Pitt had been Sir Robert Walpole's most vocal detractor and had frequently denounced Britain's Hanoverian connection as a nuisance and detrimental to the country. Accordingly, George II despised him. Pitt enjoyed widespread popularity, however, both within the House of Commons and with the public at large. That popularity propelled him into the cabinet, where the other ministers appreciated his political prestige and influence. When George II refused to countenance

Pitt's appointment, the entire cabinet resigned. Faced with an immediate need of leadership while the country was in the midst of war, George II grudgingly backed down and allowed Pitt to join the cabinet, at the same time agreeing to his vigorous policies to win the war. The war was brought to an unsatisfactory conclusion for all parties two years later in the Treaty of Aix-la-Chapelle.

By the mid-1750s, however, war once again threatened Europe. George had been pressing his ministers to send large subsidies to Hanover and its allies in Europe in the hope that the funds would help them expand their military forces. He had also negotiated a series of treaties between Hanover and other European countries to buttress the electorate's defenses in case of attack. The attempts of the various European governments to improve their positions after the unsatisfactory Treaty of Aix-la-Chapelle eventually culminated in the outbreak of the Seven Years' War in 1756.

Britain had already been at war with France in America since 1754, and George II was faced with a political quandary that threatened to undermine the country's war effort. The country clamored for Pitt to lead them in war, forcing a reluctant king to ask him to lead the government. The two quickly fell out, however, and Pitt resigned.

To take Pitt's place, George II asked the aging politician the Duke of Newcastle to form a government. Newcastle was a master of political intrigue and manipulation, but he was unprepared to organize the government for the massive worldwide conflict it faced. The result was a compromise enacted in June 1757 whereby

Monarchs of Selected European Countries during the Colonial Era

	Charles XII	1697-1718
	Ulrika Eleonora	1718-1720
	Frederick I	1720-1751
	Adolf Frederick	1751-1771

Pitt and Newcastle jointly formed a government and ran the war effort. The combination proved acceptable to the king and emerged as one of the most successful political alliances of the 18th century. Under the guidance of Pitt and Newcastle, Britain recovered from several devastating early losses and enjoyed a year of remarkable successes in North America in 1759, ensuring the protection of Hanover as well. George II watched that success with joy but did not live to see Britain's final victory in 1763. He died of a burst blood vessel on October 25, 1760, and was succeeded by his grandson, King George III.

George III, King

Born: June 4, 1738 Died: January 29, 1820

King of Great Britain and Ireland. Born on June 4, 1738, in London, the son of Frederick Louis, prince of Wales, and Princess Augusta of Saxe-Gotha, George III became heir to the British throne in 1751 on his father's death. He ascended the throne in 1760 as king of Great Britain and Ireland (1760–1820) and elector (1760–1814), then king (1814–1820), of Hanover.

At the time of George III's ascension, Britain lacked effective executive machinery. Members of Parliament were generally more interested in criticizing the prime minister and cabinet in hopes of acquiring office themselves rather than cooperating with the government. In part this resulted from both George I and George II not playing an active role in day-to-day governing, which was something that George III determined to change. Influenced heavily by his tutor, John Stuart, Earl of Bute, George III firmly believed that his chief obligation was to purify public life and to substitute duty to the nation for personal intrigue. Toward that end, George III moved quickly to put his personal stamp on the cabinet, orchestrating the ouster and resignation of William Pitt the Elder and the retirement of Thomas Pelham-Holles, Duke of Newcastle.

After removing Pitt and Newcastle, George III faced the challenge of ending the Seven Years' War and restoring the government's finances. While the Treaty of Paris was concluded in 1763, bringing peace and confirming imperial conquests around the globe, it left Britain more isolated than it had been in the past. More

George III, king of Great Britain and Ireland (1760–1820). The king's effort to reassert royal authority vis-à-vis Parliament was a leading cause of the American Revolutionary War. (National Archives)

important, at least in the short term, the expansion of overseas trade did not solve the government's financial problems, because the cost of administering its new acquisitions and paying the war debt were immense. Indeed, the cost of administration in North America was roughly seven times greater after the conclusion of the French and Indian War in 1763 than it had been at the conclusion of King George's War in 1748.

Faced with these difficulties, George III attempted to limit expansion west of the Appalachian Mountains and to force colonists to pay a portion of the war debt and meet their administrative costs. By 1765, the colonists openly defied British authority by resisting the Stamp Act as organizations such as the Sons of Liberty forced stamp masters to resign. By November 1, 1765, the date the act was supposed to go into effect, not a single stamp office was open in the colonies, forcing George III and Parliament to repeal the act in 1766. Likewise, resistance to the Townshend duties, which had been passed in 1767, led to a colonial boycott against British goods. Although George III sent troops to Boston in the fall of 1768 to maintain order—a decision that ultimately led to the Boston

Massacre—Parliament and the king once again backed down by repealing all of the duties except for the one on tea in March 1770.

After a decade of ministerial changes, in 1770 George III finally found a prime minister he liked in Lord North, leading to 12 years of stable government in Britain. This also brought a new degree of resolve in dealing with George III's subjects in the North American colonies. George III saw events such as the burning of the *Gaspée* and the Boston Tea Party as personal affronts against his authority rather than legitimate resistance to policy. Consequently, he pushed the Coercive Acts through Parliament in 1774 and appointed Lieutenant General Thomas Gage as royal governor of Massachusetts. Since Gage was concurrently the commander in chief of British forces in North America, his appointment indicated that George III was willing to use military force to enforce his authority in Massachusetts and by implication the rest of the colonies.

In the aftermath of Lexington and Concord, George III proclaimed the colonies in a state of rebellion and refused to consider the peace overtures of the Second Continental Congress. While a majority in Parliament initially supported George III's stance against the colonies, opinion began to change after the surrender of Major General John Burgoyne at Saratoga on October 17, 1777. From that point onward the war continued primarily because of George III's insistence. Lord Cornwallis's surrender at Yorktown on October 19, 1781, gave George III no choice but to appoint a new prime minister and accept the independence of the United States.

In the aftermath of the American Revolutionary War, George III suffered frequent mental and physical breakdowns that increasingly left the government in the hands of his ministers, especially William Pitt the Younger. While the strain of the American Revolutionary War contributed to the king's declining health, his incapacities were most likely the result of porphyria, a chemical imbalance in the blood. By 1811, George III's condition deteriorated to the point that Parliament was forced to establish a regency under the Prince of Wales, who would succeed to the throne as George IV after George III died on January 29, 1820, in Windsor Castle, near London.

Georgia

Last of the North American colonies established by Great Britain, Georgia lay in a disputed zone between South Carolina and Spanish Florida. The first Europeans to arrive in the area known today as Georgia were Spanish conquistadors from St. Augustine. They established a small outpost on St. Catherines Island in 1566. Catholic priests soon joined them and founded at least two missions on the coastal islands. These missions grew during the next century and became centers of Spanish influence, controlled by the regime headquartered at St. Augustine.

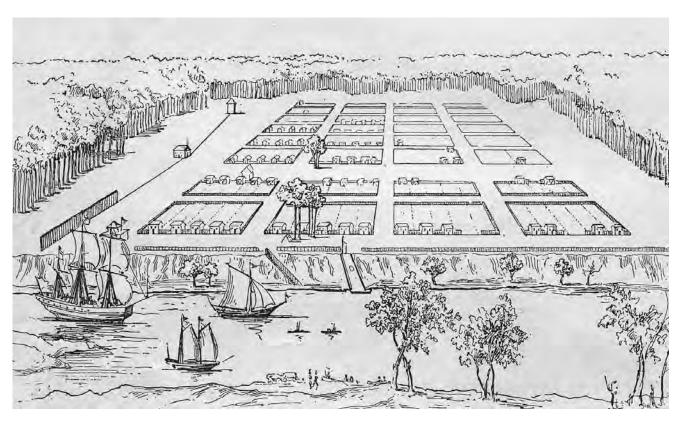

The English claimed Georgia in 1663, when King Charles II established and granted the Carolinas as far south as St. Augustine to eight Lords Proprietor. Georgia's low country eventually became a battleground between the English and Spanish, along with their native allies, until the Spanish finally evacuated Florida in 1763.

In 1730, a group of merchants, including James Edward Oglethorpe, petitioned King George II for land south and west of Carolina. On June 9, 1732, a charter was granted that created 21 trustees who would manage a new colony called Georgia. The establishment of Georgia required addressing two distinct security concerns. The first involved the struggle between the Spanish and English for control of disputed land between the Carolinas and St. Augustine. The second involved the keen competition with the Spanish to secure trade with the southern Native Americans between the Atlantic and the Mississippi River. Although the trustees had responsibility for settling and governing the new colony, the king had to approve any laws related to their enterprise. As such, defense issues and control of foreign and native trade were reserved for the British government in London.

In addition to its role as a military buffer, Georgia also was to serve a philanthropic purpose. Having lost a close friend who died in debtor's prison, Oglethorpe hoped to provide a haven for debtors, so they could earn funds to pay off their debts. Toward this end, the trustees forbade importing rum and slaves and limited land holdings to 500 acres to ensure that settlers would be industrious and that large landowners from nearby colonies would not be inclined to move into the colony. The trustees also established a policy of religious toleration and allowed non-Englishmen to settle in the colony.

Oglethorpe accompanied the first colonists to Georgia and helped start the colony in November 1732. The success of Georgia rested with Oglethorpe, an energetic and able man who selected the first settlement site along the Savannah River at a point called Yamacraw Bluff, which overlooked the river. Located several miles from the coast, the settlement became modern-day Savannah. Oglethorpe reached an agreement for the land with the Yamacraws and their chief, Tomochichi. A few months later, the Creeks ceded to the English all the lands between the Savannah River and Altamaha River. Oglethorpe laid out the town of Savannah, and settlers began establishing their homes and farms. Even though Oglethorpe was an agent of the trustees, he had no specific title and was given no guidance on political organization for the colony.

The first non-British colonists to seek refuge in Georgia were German Protestants who were expelled from their homes in Salzburg and landed in Savannah in 1734. They settled 25 miles upriver at a town they called Ebenezer. In 1735, 150 Scotch High-

Contemporary print showing Savannah, Georgia, in 1733, founded by Englishman James Oglethorpe. (Chaiba Media)

landers settled on the frontier at Darien on the Altamaha River. Settlement continued into the wilderness and therefore closer to conflict. Oglethorpe constructed a fort at the falls of the Savannah River, which became the town of Augusta and a thriving center for trade with the Creeks, the Chickasaws, and the Cherokees.

In 1736, Oglethorpe established Frederica—and Fort Frederica—on St. Simons Island, south of the Altamaha and the official southern limits of Georgia. Frederica was in essence a fortified military town because of its exposure to Spanish raids from Florida. Other forts were established along the Inland Passage and on the islands between Frederica and the St. Johns River, but there were usually insufficient troops available to garrison them.

In both Georgia and South Carolina, settlers demanded security for their settlements and trade activities, which were menaced by both the Spanish and natives. In 1738, Oglethorpe returned to Georgia from a visit to England and brought with him the 42nd Regiment of Foot and a commission as commander in chief of British forces in both South Carolina and Georgia. Oglethorpe knew that the Georgia-Florida frontier would be a battleground in any future conflict with the Spanish. Thus, he took measures to prepare for the defense of the coastal islands.

War with Spain began in 1739 and became known as the War of Jenkins' Ear, or the Anglo-Spanish War (1739–1744). Oglethorpe immediately seized the offensive and captured several Spanish frontier forts along the coast. In the spring of 1740, he set out with

the 42nd Regiment, Georgia and Carolina militiamen, several companies of rangers, and native allies. In all, there were about 4,600 men who were to attack St. Augustine. The attack did not succeed, however, and Oglethorpe was forced to fall back to his base at St. Simons Island.

In June 1742, a 4,500-strong Spanish force landed at St. Simons Island and attempted to attack Frederica. But Oglethorpe was able to check and defeat the invaders at the Battle of Bloody Marsh. This defeat compelled the Spanish to withdraw back to Florida and abandon any further attempt to invade Georgia. In 1743, Oglethorpe made another attempt to capture St. Augustine, but that too failed as he had no artillery or besieging equipment. After the war ended in 1744, all provincial forces disbanded and Georgia's brief experience as a theater of war was over.

Oglethorpe left Georgia, never to return, in July 1743. He had given 10 years of his life and more than £91,000 of his own money to establish the colony. He never received any compensation for his services in Georgia, but he did earn enduring fame.

The prosperity of the colony depended on income from lumber products, cattle, and trade with the natives. Timber, barrel staves, and potash were forest products that found a ready market in the West Indies and in Europe. Augusta became a rendezvous where native traders delivered deerskins for shipment by river to Savannah.

Gradually, the trustees' restrictions eroded through lack of enforcement. After 1742, the law prohibiting rum was ignored.

Though many of the immigrants opposed slavery, many Georgians saw the benefit of it as a way to escape labor in the hot sun and to provide workers for rice plantations. Georgians obtained many slaves in neighboring South Carolina, and by 1750 the trustees had moved to legalize slavery in the colony.

In 1751, the first elected assembly was called by the trustees, but it only had power to recommend. It could not legislate. By this time, there were approximately 2,000 whites and 1,000 African Americans in Georgia. The trustee era ended on June 23, 1752, when the trustees, wearied of their experiment, returned the charter to King George II.

The royal government created for Georgia in 1754 was similar to that of other royal colonies in America. The main difference between Georgia and the older colonies was that principal government officials were paid directly by London. This gave them a certain independence from the colonial assembly. Georgia was divided into eight parishes in 1758 for government and church organization, and four more were added in 1765 for lands south of the Altamaha River.

Georgia's first royal governor, Captain John Reynolds of the Royal Navy, arrived in 1754 but was recalled two years later chiefly because he chose to govern much as he would run a ship. He was succeeded by Henry Ellis, a more able and popular governor, but his ill health forced him to leave the post after about three years. In 1760, London appointed Georgia's third and last royal governor, James Wright. Wright had served as a colonial attorney general in South Carolina for many years and knew how royal government worked between London and the colonies. His long tenure in his job, his personal interest in Georgia's development, and his considerable ability made him very influential in the development of the colony.

By 1763, Georgia had a well-organized and well-run provincial government and no longer faced significant threats from other European powers on the frontier. The 1763 Treaty of Paris made native relations much easier. And the natives' cession of all the lands between the Savannah River and Ogeechee River as far as northwest of Augusta and of coastal lands between the Altamaha River and St. Mary's River made considerably more land available for settlement. Georgia's southern boundary was extended to the St. Mary's River. Now adjoining the frontier was another British province, East Florida.

Georgia's population grew rapidly after 1763 until the outbreak of the American Revolutionary War, when it numbered between 40,000 and 50,000 people, almost half of whom were slaves. Meanwhile groups of settlers continued to migrate to Georgia. In 1752, a group of Puritans who had lived for several generations at Dorchester, South Carolina, moved as a group to Georgia and settled at Midway. Further settlement in the backcountry by Virginians and Carolinians via the old wagon road contributed to the increase in population. Settlement was further encouraged by the cession of more Creek and Cherokee lands in 1773, north and west of Augusta, although the reluctance of some Creeks to accept the cession produced some attacks on frontier settlers and nearly led to all-out war.

By 1775, on the eve of the American Revolutionary War, Georgia bore little resemblance to the colony envisioned by the trustees

in 1732. Georgia owed its existence chiefly to the strength and dedication of Oglethorpe, who had invested his fortune and expended much effort to ensure that the enterprise would be a success.

Gist, Christopher

Born: 1706 Died: 1759

Distinguished frontier scout and surveyor, who provided the British with the first detailed description of southern Ohio and northern Kentucky. Born near Baltimore, Maryland, in 1706, Christopher Gist was the son of Richard Gist, a surveyor who helped plot the city of Baltimore. Christopher Gist married Sarah Howard, with whom he had five children. His son Nathaniel, who married a native girl named Wurteh, was the father of Sequoyah, who was later credited with inventing the Cherokee alphabet.

Gist was an early explorer of Ohio and Kentucky for the Ohio Company, a Virginia-based company established in 1747 by wealthy planters dedicated to extending the Virginia colony's settlements westward. In 1749, a royal charter granted the Ohio Company 200,000 acres of land in the Ohio Valley with the proviso that it would be granted an additional 300,000 acres if it could build a fort and lure settlers into the region. Therefore, in 1750 the Ohio Company commissioned Gist to explore their territorial claims in the region between modern-day Pittsburgh and Louisville. Gist was also charged with ascertaining the strength of Indian tribes. Gist kept an extensive diary of his journeys. His first visit in 1750–1751 explored the headwaters of the Ohio River and eastern Kentucky, while his second visit in 1751–1752 centered on the West Virginia region.

Gist was George Washington's guide during the latter's 1753–1754 journey to Fort Le Boeuf. Washington carried a letter from Virginia's Lt. Gov. Robert Dinwiddie that ordered the French out of the Ohio Valley. Although Gist twice saved Washington's life on the journey, this mission was a failure. Gist accompanied a detachment of the Virginia Militia that unsuccessfully tried to forcibly expel the French from the region in the summer of 1754. In 1756,

Christopher Gist, a well-known Indian scout and surveyor, depicted here with George Washington on a raft. (Library of Congress)

Gist recruited Cherokees in the Carolinas to fight for the British in the French and Indian War. Gist died in the summer of 1759 of smallpox.

Glen, James

Born: 1701

Died: July 18, 1777

Royal governor of South Carolina, 1738–1756. Born in Linlithgow, Scotland, in 1701, James Glen entered local politics at an early age, at the same time cultivating friends and patrons in London. After studying law at the University of Leiden, he served as provost of Linlithgow from 1724 to 1725 and again from 1730 to 1737.

A fortuitous marriage helped Glen secure the post of royal governor of South Carolina in 1738, although he did not arrive in Charles

Town (present-day Charleston) until almost five years later, in 1743. Two imperial wars, the War of Austrian Succession (1740–1748) and the French and Indian War (1754–1763), framed Glen's long tenure, but brought little armed conflict to South Carolina, save for the occasional privateer off the coast. Mostly, Glen had to manage the sensitive balances of southeastern Native American diplomacy, working to win native allies even in the interwar years.

Native affairs occupied much of Glen's time and personal interest and certainly provided the most important legacies of his career. By 1745, he had developed a plan for future British efforts in the southeast, echoing Thomas Nairne's 1708 memorial that called for enlisting native aid for attacks on Mobile and Louisiana and erecting British forts near Native American settlements, one each among the Choctaws, the Chickasaws, the Cherokees, and the Catawbas. Glen's greatest challenge in native affairs was that of securing peace among the various confederacies as a means of improving English influence and firmly attaching native loyalties to Britain. Indeed, he was more willing than most British governors to personally travel to Native American settlements to secure his ends.

Glen's involvement in native affairs produced mixed results. In the mid-1740s, his role in mediating the Choctaw Civil War proved an early embarrassment. Glen had better luck in his dealings with the Cherokees and the Creeks, however. During a series of talks in the early 1750s, he brokered an uneasy (but longstanding) peace between the two rivals. In 1755, he also managed to convince the Cherokees to finally allow two British forts in their territory: Fort Prince George, built in 1753, and Fort Loudoun, built in 1756.

The British government replaced Glen in 1756 with William Henry Lyttelton, who oversaw the completion of Fort Loudoun. Glen remained in America for five more years, lending his assistance and influence among the Cherokees and helping in Virginia's 1758 campaign against Fort Duquesne. Glen returned to Britain in 1761 and died in London on July 18, 1777.

Glorious Revolution in America

Start Date: 1688 End Date: 1690

Bloodless uprisings in Massachusetts, New York, and Maryland spawned by the Glorious Revolution (or English Revolution) of 1688. The catalyst of events occurred in 1685, the year King James II ascended to the throne. During the 1670s, many English colonies had experienced crises that drew intensified scrutiny from the Crown. The Dutch recapture of New York in 1673, King Philip's War in New England (1675–1676), and Bacon's Rebellion in Virginia (1676–1677) all took place at a time when royal authorities were already trying to centralize the administration of the colonies and increase the revenue derived from them. King Charles II's regime strengthened the Navigation Acts and created the Lords of Trade and Plantations to oversee the colonies and the collection of revenue there. King James II continued the trend, incorporating the New England colonies, New York, and East and West Jersey into a single entity, the Dominion of New England, modeled on the Spanish viceroyalties.

In early 1689, after receiving news that William of Orange and his wife Mary, James II's daughter, had joined forces with Parliament to overthrow James II in December 1688, colonists rose in revolt. Two thousand militiamen in Massachusetts quickly seized Sir Edmund Andros, governor of the Dominion of New England, and installed an interim government modeled after the charter of 1629. In New York, followers of the militant Calvinist Jacob Leisler assumed power in the divided colony after they forced the flight of Lt. Gov. Francis Nicholson. And Maryland's John Coode led a group known as the Protestant Associators in the ouster of that colony's proprietary governor, William Joseph.

In all of these upheavals the rebels professed loyalty to England and, with varying degrees of success, negotiated new governments with the Crown. Massachusetts received a compromise charter that represented an improvement over the Dominion of New England. New York saw power returned to its old elite and the execution of Jacob Leisler for treason. Only in Maryland did rebels formed into a "Protestant Association" achieve most of their aims, with the king and his ministers appointing a Protestant royal governor and a council made up of Associators, establishing the Anglican Church, and barring Catholics and Quakers from office. Although the new governments did not eliminate political factionalism, they proved relatively conciliatory and underpinned a stability that would last until the 1760s, helping to unite colonies and mother country into an increasingly powerful empire.

Gloucester Fort (Virginia)

English post located at Gloucester Point on the north bank of the York River where it meets Chesapeake Bay and opposite Yorktown, Virginia. Gloucester Fort was often called Tyndall's Point or Tyndall's Fort after the English mariner who first mapped the area in 1608. Given its strategic location, Gloucester Point was first home to a tobacco warehouse to serve local planters.

English colonists constructed the first palisaded fort on the site in 1667 to protect the waterways of the York and the James rivers. These waterways potentially offered the Dutch, who had just declared war against England, access into the interior of the colony. The fort was officially renamed Fort James when it was rebuilt with brick in 1671. In 1676, rebels under the command of Nathaniel Bacon captured the fort before crossing the river and moving on to sack Jamestown. Renamed Gloucester Fort in the early 18th century, this 15-gun redoubt was listed in a 1749 military report as being in ruins. With the onset of the French and Indian War (1754-1763), the English repaired the fort and installed 12 new guns. The British Army refortified the installation during the American Revolutionary War in August 1781 to include the main fort (Tyndall's Fort) and four outer redoubts. During the Yorktown Campaign, forces under lieutenant colonels Banastre Tarleton and Thomas Dundas occupied the fort and were forced to participate in the "Second Surrender" at Gloucester Point following the defeat of British forces at Yorktown. In 1807, Virginians again armed the fort, during the war scare of that year.

Confederate troops then constructed fortifications on the site of the original fort, renaming it Fort Brown in 1861. It was overrun and occupied by the Union Army under Major General George B. McClellan during the 1862 Peninsula Campaign.

Goffe, John

Born: March 16, 1701 Died: October 20, 1786

Colonial military officer. Born in Boston, Massachusetts, on March 16, 1701, John Goffe (sometimes spelled Goff) moved with his family while young to a settlement along the Merrimack River that later

Militia officer John Goffe in Hadley, Massachusetts, during the French and Indian War, ca. 1760. (Brown Brothers)

became Londonderry, New Hampshire. He first served in the militia in 1725 during Dummer's War (1722–1727), when he joined John Lovewell's foray to Pequawket. However, Goffe was left behind at a fort to tend the sick and did not participate in the ensuing operations.

Goffe later settled in the area of present-day Manchester, New Hampshire. On the outbreak of King George's War (1744–1748), he was offered command of a company of New Hampshire troops assigned to protect the Merrimack Valley, which he accepted. He joined a provincial regiment raised to attack Quebec in 1746, but the operation never occurred. Instead, Goffe accompanied the regiment to Lake Winnipesaukee, where the men built and occupied a fort during the winter of 1746–1747.

At the end of the war, Goffe moved again to an area west of the Merrimack River. The settlement there was named Goffstown. At the start of the French and Indian War (1754–1763), Goffe took

command of New Hampshire scouts who patrolled the frontier. The following year, he became a captain in the New Hampshire regiment that joined British and provincial forces operating against the French post at Crown Point. The New Hampshire unit was assigned to construct Fort Edward but did not see combat.

In 1757, the New Hampshire troops were sent to Fort William Henry, where they helped defend the fort against the French siege. Goffe, now a lieutenant colonel, was among the officers who urged the British commander to surrender. After the capitulation, natives ambushed the garrison as it left the fort. Goffe survived, although the New Hampshire regiment suffered 80 casualties.

Goffe's regiment returned to the field in 1758 and 1759, but again saw little action. He took command of the New Hampshire regiment in 1760 with the rank of colonel, and completed construction of the road linking the Fort at Number Four on the Connecticut River with

Crown Point before going on to serve in the attack on Montreal later that year.

After the war, Goffe was elected to the New Hampshire legislature, served as a judge, and commanded the Hillsborough County Militia. A strong advocate of independence from Great Britain, he helped recruit troops but was too old to take a more active role in the American Revolutionary War. Goffe died near Bedford, New Hampshire, on October 20, 1786.

Golden Hill, Battle of

Event Date: January 19, 1770

Skirmish between American colonists and British soldiers in New York City. The colony of New York became a focal point of opposition to British imperial policy in the 1760s, as the assembly refused to comply with the Quartering Act (1765), which required colonial authorities to house and supply, at taxpayers' expense, British troops in barracks or vacant public buildings. New York was disproportionately affected because the majority of troops stationed along the western frontier to police the 1763 Proclamation Line were redeployed to New York, with most of them stationed in New York City.

At first the New York Assembly refused only to appropriate all of the funds required to maintain troops, but as animosities deepened the assembly refused to appropriate funds for any purpose. The impasse worsened in 1767 after Parliament passed the Townshend duties. Colonists demonstrated their opposition to British authority by erecting a liberty pole in what is now City Hall Park. Tensions between soldiers and the citizenry remained high, as off-duty soldiers took jobs for low wages, which adversely impacted dockworkers. Brawls between colonists and British regulars became a frequent occasion in New York City's taverns and streets.

The situation worsened in late 1769, when a moderate majority was elected to the New York Assembly and appropriated £2,000 for troops. While royal officials were pleased, leaders of the Sons of Liberty immediately attempted to stir up a protest. In a pamphlet entitled *To the Betrayed Inhabitants of the City and Colony of New York*, Alexander McDougal, leader of the local Sons of Liberty, condemned the assembly's actions. In response, soldiers posted derogatory broadsides that raised tensions to a fevered pitch.

It was in this atmosphere of animosity and street brawls that British officials dispatched troops on January 17, 1770, to cut down the liberty pole that had been erected in the park. Adding insult to injury, the soldiers threw pieces of the pole in front of a tavern that served as McDougal's headquarters. Two days later members of the Sons of Liberty seized a small contingent of the soldiers who had taken down the liberty pole. When more British troops arrived to rescue their comrades, the mob, which was armed with swords and clubs, retreated to a nearby wheat field known as Golden Hill. Taunts soon gave rise to violence as soldiers fixed bayonets and charged the hill to disperse the mob. Although no one was killed in the clash, several were seriously injured, before British officers arrived and ordered troops to their barracks.

Although the so-called Battle of Golden Hill is not as well remembered as the more famous Boston Massacre, which would occur two months later, it revealed and contributed to the growing tension between British authorities and American colonists.

Grand Pré, Battle of

Start Date: February 11, 1747 End Date: February 12, 1747

Battle between British and French and allied forces during King George's War (1744–1748), one of the bloodiest contests in the history of Nova Scotia, and a convincing French victory. In December 1746, British colonel Arthur Noble arrived at Grand Pré with more than 500 Massachusetts troops and settled in for the winter. He brought with him the frames of two blockhouses, but the ground was too frozen to erect them, and Noble thus dispersed his men among two dozen Acadian homes in the village of Grand Pré.

There was only one fortified building in the town, a large structure known as the "Stone House." Despite scattering his army over an area of more than a mile, Noble was unconcerned about its welfare. The French encampment was nearly 200 miles away and harsh weather appeared to make winter campaigning impossible.

The French, however, decided to strike before British reinforcements could arrive in the spring. Wearing snowshoes and pulling sleds, 300 French soldiers and their Native American allies set out for Grand Pré on January 21, 1747, under the command of Captain Nicholas Antoine Coulon de Villiers. By February 10, Villiers's men had closed to within a few miles of the British position. They

remained undetected. To strike as many of the scattered houses as possible, the French divided themselves into 10 parties, the largest of which Villiers himself would lead against the Stone House.

The attack began at 2:30 on the morning of February 11, 1747, in near blizzard conditions. The weather worked both for and against the French. The blinding snow concealed their approach, but it also caused Villiers's group to become disoriented and raid an outlying building rather than the Stone House. The initial rush caught the British completely off guard, and many homes were quickly overrun. Noble was killed in the first few moments of the battle. Villiers was seriously wounded, but his men drove about 350 British troops into the Stone House.

At this point, a curious stalemate developed. The French did not have enough healthy troops left to assault the Stone House, nor did they have enough supplies for a prolonged siege. The numerically superior British could not sally because, lacking snowshoes, they would flounder helplessly in the deep snow. On February 12, the two sides negotiated a nonviolent conclusion. The British would vacate Grand Pré without surrendering. However, they had to agree not to return to the area under arms for six months. Finally, all prisoners taken in the fighting remained in French custody.

In the battle the British suffered 131 dead, 34 wounded, and 53 lost to captivity. The French lost only 22. The victory proved fleeting for the French, however. With supplies running low, the men exhausted and sick, and with no hope for reinforcement, Villiers abandoned Grand Pré just a few days after the British departure.

Great Britain

Nothing epitomized the wealth, power, and reach of Great Britain in the mid-18th century more than the scene along the river Thames in London. A forest of ships' masts stretched for miles along the river, as vessels from India, the Caribbean, and North America unloaded their tea, sugar, and timber. At the same time, other ships waited to carry these goods to continental Europe and points beyond. This traffic overwhelmed the river and its narrow wharves, forcing larger ships to transfer their cargoes to smaller lighters and barges in order to reach the shore; such overcrowding would eventually spur the creation of a system of locks, basins, and warehouses off the river in the early 19th century. Until then, however, the Thames remained a chaotic place, prosperous but disorganized, yet

always a reminder, in one observer's words, of London's place as "a kind of Emporium for the whole Earth."

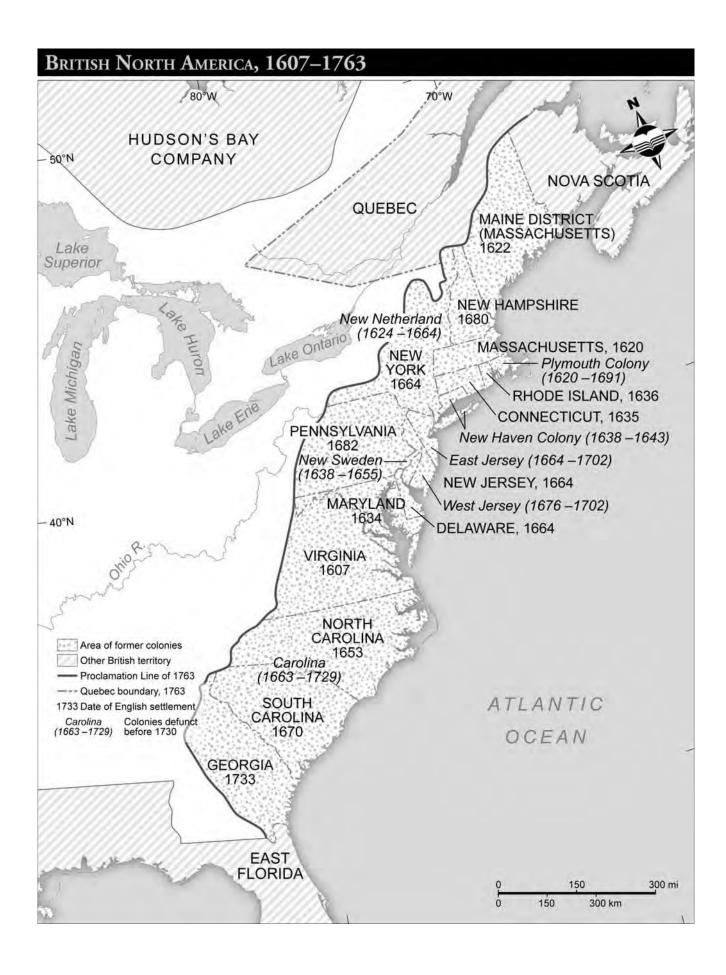

This frantic Thames activity illuminated and exemplified several aspects of what some historians have described as the "first" British Empire. It was a colonial system that reached from the Atlantic to the Indian Ocean and depended on trade as its lifeblood. The wealth created by this empire profoundly changed both social structures and patterns of consumption in the imperial metropole as well as in the colonies.

The role of the British state in this system was, however, somewhat ambiguous. The Royal Navy, the world's largest and best-equipped fleet, controlled the shipping lanes on which this commerce relied, even including a continually expanding British interest in the African slave trade to both North and South America. Yet private investors and joint-stock companies had driven British expansion, not just in the Atlantic world, but in South Asia as well, where the East India Company, largely left on its own, had embarked on its own brand of power politics and territorial rule by the late 1750s.

The Navigation Acts, first enacted in the 17th century, did compel the colonies to ship their goods to London for reexport and to use British-owned carriers, but in many other aspects the colonies enjoyed some autonomy in governing themselves; it was a philosophy characterized as "salutary neglect" and was personified by various royal governors in North America who allowed colonial assemblies some leeway in the name of commercial continuity and stability. In this way, the traffic on the Thames represented the colonial system in microcosm: It was prosperous, privately controlled, and only loosely regulated. It would take a change in the nature of the British state's relationship with its American colonies to disrupt this commercial system and redirect the British Empire eastward at the start of the 19th century.

Following the projection of Spanish and Portuguese power into the Indian Ocean and the Americas in the 16th century, England began to establish its own colonial trading ports and settlements. The English were relative latecomers to this process, for by the end of the 16th century, Spain and Portugal possessed prosperous colonial settlements in the Americas, including silver mines in Peru and sugar plantations in Brazil. Moreover, the Portuguese, headquartered at Goa on the western Indian coast, had taken control of commerce and traffic in the Indian Ocean. Dutch colonial expansion was also underway, especially in the Spice Islands of Southeast Asia.

Unlike the Spanish and Portuguese, however, the English government eschewed state-run expansion, instead granting monopolies, trade concessions, and some naval protection to private merchant or joint-stock companies that undertook the actual risks of these ventures. These included the East India Company (chartered in 1600), the Virginia (London) Company (1606), and the Massachusetts Bay Company (1629). By the early 1700s, other settlements, including plantations in the West Indies, trading posts in Canada, and colonies on the Atlantic seaboard had joined these initial English provinces to make up an Anglo-dominated Atlantic world. Moreover, rule by private companies in these various settlements, including the earlier

ones, had in most cases given way to a system of crown colonies supervised by the Board of Trade and Plantations in London and royal governors throughout. These English settlements did, however, retain elected legislatures that controlled their internal taxation and many legal matters. The appointed governors, whose salaries were paid by the assemblies, often faced threats to withhold their stipends if certain matters were not settled to the legislators' satisfaction.

The British Empire continued to expand through the 18th century, suffering its only real setback toward the end of the period, in the American Revolution. Its possessions included the North American colonies, the Caribbean islands of Jamaica and Barbados, and, after 1763, former French possessions in Canada and formerly Spanish Florida. Britain's reach extended even further, though, largely through the agency of merchant companies that had established trading forts along the western coast of Africa and in South Asia. In the latter, the East India Company had begun by midcentury to expand its actual political control, first in the northeastern region of Bengal, and then throughout northern and central India by the early 1800s. The loss of the American colonies, then, was counterbalanced by an increasing British presence in South Asia, albeit one that would lie in the hands of the East India Company until the Sepoy Rebellion of 1857 and the assumption of direct British rule in 1858.

This far-flung colonial empire, and the prosperity it brought to Britain, dominated foreign and military policy under the Stuarts and Oliver Cromwell, and continued to do so after the emergence of parliamentary sovereignty following the Glorious Revolution (1688–1690). As Lord Halifax noted succinctly in the late 17th century, "We fight for trade, the fairest mistress men ever knew."

Trade was indeed a state or national interest, and commercial competition in the Atlantic soon became an integral part of European geopolitics, feeding rivalries among Britain, France, Spain, and the Netherlands in particular. These commercial concerns were thus absorbed into the larger conflicts that dominated political, religious, and military life in Europe and could often, but not always, be distilled into a general struggle between Protestant Britain and the Catholic (Bourbon) powers.

For British governments, the overriding concern was to ensure that trade survived and that no power overwhelmed the rest on continental Europe, thus leaving Britain exposed and isolated. Furthermore, though the post-1689 Parliament remained largely the province of the traditional elite through the 18th century, many of these aristocrats and landed gentry had familial or financial interests in the maintenance of this imperial system. The younger sons of aristocratic families found employment in the armed forces, colonial administration, and, increasingly, in the merchant and financial firms that thrived on colonial trade and investment. These included private banks such as Hoare's and insurance concerns such as the famous Lloyd's of London.

Wealthy absentee owners of West Indian plantations had maneuvered themselves into elite society and even attained seats in

Parliament. India proved especially attractive. Significant numbers of British ministers of Parliament were also shareholders in the East India Company, and several aristocratic families, including Irishmen such as Richard (1760–1842) and Arthur (1769–1842) Wellesley (later Duke of Wellington), were deeply involved in expanding company rule there.

The first order of business for these Britons, however, was to make sure that there existed a trade to protect at all. Oliver Cromwell's Parliament passed the first Navigation Act in 1651, mandating that only English ships could carry goods into English or colonial ports. This policy had a dual impact: It stimulated English shipbuilding and the growth of a merchant marine, and it also led to a series of wars with the Dutch, who saw an end to their dominance of the Atlantic carrying trade. This encounter in many ways spelled the end of hostilities between these two powers, a peace cemented in 1688 by the English Parliament's offer of the throne to William of Orange, stadtholder of Holland. King Charles II (reigned 1660-1685) expanded the scope of the Navigation Acts to include a prohibition on colonial trade of certain "enumerated articles" with any port outside Britain or the colonies, thereby ensuring a steady flow of sugar, tobacco, and naval stores to British ports for reexport. These Navigation Acts reinforced trade patterns already in place, and were the foundation of colonial mercantile policy until the American Revolution.

The ever-expanding trade system largely meant the protection of shipping lanes and ports from Cromwell's time through the 1740s. It also meant a policy of harassment of rival trading powers, something that the English had pursued since the latter years of Elizabeth I's reign (1558–1603), when licensed "privateers" such as Francis Drake (ca. 1540–1596) and John Hawkins (1532–1595) prowled the Atlantic. State-sanctioned piracy continued through the 17th century—another example of Britain's interest in undertaking foreign ventures as cheaply as possible—with its most successful practitioner, Henry Morgan (ca. 1635–1688), eventually gaining a knighthood and a temporary appointment as governor of Jamaica.

The British Army had very little to do with the various colonial wars and skirmishes between settlers and Native Americans that marked the late 1600s, including King Philip's War (1675–1676). Cromwell's navy seized Jamaica from the Spanish in 1655. By and large, though, North American and Caribbean engagements before the 1750s figured as episodic moments during Britain's larger struggle with Spain and France for dominance and security in Europe.

Europe remained the major battlefield during both the War of the Spanish Succession (1702–1713, known in America as Queen Anne's War) and the Anglo-Spanish War (the so-called War of Jenkins' Ear) of 1739–1744, which did, nevertheless, originate in Anglo-Spanish hostility over smuggling by the ill-starred English South Sea Company. King George's War (1744–1748) featured the capture of the French bastion of Louisbourg (in the Canadian maritimes) by a joint force of British soldiers and colonial militiamen, backed by British naval support, but it was returned to France at war's end, in exchange for the French return of Madras on the

southeast Indian coast. There was much disgust in the colonies at this agreement.

The 1750s saw a change in British military strategy, one that placed much more emphasis on the role that colonies, trade, and naval might could play in European geopolitics. The target was France, Britain's only real competitor on the seas and in the Atlantic world. More populous, possessed of a much larger army, and eager to expand its colonial territories, France was indeed a significant threat, one that half a century of intermittent warfare before 1750 had not weakened. The great proponent of what became known as the "blue water" strategy was William Pitt the Elder (1708–1778), the king's first minister during 1757-1762. Pitt had famous family ties to empire and trade; indeed, his grandfather, Thomas "Diamond" Pitt, had been a merchant in India and the one-time owner of the largest diamond in the world, and he placed the expansion of British colonial rule and British control of global maritime trade at the center of his strategic thinking. For Pitt, the struggle to contain continental rivals, especially France, was best pursued not on the battlefields of Central Europe, but on the high seas and in the colonies.

This "blue-water" strategy relied on Britain's strengths, especially its naval prowess and its well-run state finances. Under Pitt's plan, the Royal Navy would patrol British waters to guard against invasion, and would also blockade French trade in the Atlantic, thus depriving the Bourbons of the chance to bolster their own state coffers. Furthermore, the navy would transport British soldiers to North America, where even a relatively small military presence would be enough, with colonial help, to bring New France under British control and again disrupt French overseas commerce. The final component of this strategy was a British alliance with, and funding of, Central European states who might keep the French occupied on land while the Royal Navy dominated the seas. Economic support for Prussia, and even more significant financing of the army of the German state of Hanover (ancestral home of the Kings George), could allow Britain to fight by proxy on the Continent.

Pitt's ideas played out in practice in the 1750s. Renewed conflict arose in 1754 between the North American colonists and France over the latter's attempted expansion into the Ohio River Valley; France's alliance with many groups of natives led, of course, to this conflict being named the French and Indian War, at least in the British colonies. By 1756 this contest had become part of a much larger European conflagration pitting Britain and Prussia against France, Austria, and Spain, among others. While Prussian forces kept France occupied in Europe, the Royal Navy clamped down on French shipping and transported about 20,000 British soldiers to North America. This influx of British personnel, which was matched by an equal number of soldiers from the colonies, allowed Britain to invade Canada and defeat French forces there, most notably in the 1759 battle for Quebec that played out on the Plains of Abraham outside the city. Meanwhile, the Royal Navy destroyed the French fleet in the Atlantic, the Mediterranean, and the Caribbean. The Peace of Paris (1763) solidified these gains, leaving Britain with a markedly increased global empire, including all of French Canada, the Ohio Valley, and Spanish Florida.

The costs of Pitt's strategy were enormous, though, including the funding of naval shipbuilding and the extension of financial aid to Prussia and to Hanover. Pitt himself stepped down from office in 1762, but his successors, believing that the notable beneficiaries of Pitt's war had not contributed much financially to the effort, attempted to recover some of these expenditures from the American colonies with, of course, unfortunate negative consequences. Pitt did not live to see the end of the American Revolution, but when his second son, William (the Younger), ascended to the premiership at the precocious age of 24, he presided over an empire that had been, at least momentarily, much reduced.

Overseas military and commercial expansions indeed went hand-in-hand in the 17th and 18th centuries, and their impact on Britain was not limited solely to these spheres, but instead influenced many aspects of metropolitan life. London, the premier trading port, grew immensely. Its population reached 675,000 by 1750, comprising 10 percent of the total British population. Other cities prospered too, as Bristol and Liverpool fared well from Atlantic commodity and slave trades in particular. The growth of urban banking and merchant ventures had a profound influence on the growth of the British state, allowing it to finance its strategic plans not only from tax revenue, but from government securities issued through the Bank of England and traded on the London Stock Exchange. The period after the Glorious Revolution also saw the gradual improvement of governmental revenue collection, including property taxes and customs duties. This emergence of what historians have described as an efficient "military-fiscal state" allowed Britain to maintain its naval supremacy throughout the century. The Navigation Acts served to increase both the size of the British merchant fleet and the capability of civilian dockyards in Newcastle and in Plymouth.

The expansion of trade and imperial rule also led to some significant social and cultural changes in Britain. Nouveau riche bankers, merchants, and traders began to infiltrate the ranks of the aristocracy; the age of the "gentlemanly capitalists" had begun. This wealth, plus the extensive reach of British trade, created a burgeoning interest in consumer goods among more than the wealthiest in society. Native American fabrics, tea, coffee, and sugar—not to mention American tobacco—all became favorites for conspicuous consumption by the "middling sorts" in urban areas. The import of these goods also sparked a growing sense of an economic divide in Britain, especially in London, where those who unloaded the groaning East Indiamen on the riverside docks could not themselves afford such goods.

Occasional thefts and the growth of a dockside black market allowed some of these laborers to supplement their otherwise meager wages, but inevitably caused tensions between workers and merchants. However, among those who could purchase these colonial products, and among those whose work at least brought them daily into contact with colonial goods, ships, and sailors, there did emerge a growing interest and pride in Britain's international might

and reach. Empire now informed English patriotism and provided the basis for a new British nationalism.

The British Empire was a great trading empire in the 17th and 18th centuries. It enriched many people, allowed them to build the largest navy in the world, and transformed everything from what Britons wore, to what they drank, and how they saw themselves in the world. It was an empire based very much on private investment, one in which the government consciously and consistently tried to minimize its own financial contribution and exposure. The American Revolution exposed some of the difficulties in such a colonial approach, but not before the establishment of a world where, truly, Britannia ruled the waves.

Great Britain, Army

For a century following the English colonization of North America that began in 1607, the ad hoc assemblage of English settlements remained largely devoid of regular armed forces to defend them. Prior to 1661, England lacked a sizable standing military establishment while the colonies, undertaken as commercial instead of national ventures, were left to fend for themselves. Therefore, throughout most of the 17th century, the British Army was initially represented by military veterans or adventurers, such as John Smith of Virginia and Myles Standish of Plymouth. Few in number, such men nonetheless constituted an experienced cadre around which the first American militias arose. Their valuable leadership, in concert with advanced European-style weaponry, usually prevailed over Native Americans in countless skirmishes.

The ensuing tumult of the English Civil War (1642–1649), the Age of Oliver Cromwell, the Stuart Restoration in 1660, and the Glo-

rious Revolution of 1688 finally occasioned the rise of standing, professional forces in England. Nevertheless, these forces were constrained for political and ideological reasons to a handful of regiments in the immediate employ of the sovereign. The most noted example in this regard was the Coldstream Guards, the most senior formation in the army. Moreover, when regular forces were deployed to the colonies at all, as in the case of the conquest of New York from the Dutch in 1664 or Bacon's Rebellion in Virginia in 1676, they were usually restricted to a handful of infantry companies. Even during the authoritarian period of the Dominion of New England under Governor-General Sir Edmund Andros, very few regular companies were present to back up royal rule. In the aftermath of the Glorious Revolution (1688–1689), many of these troops were forcibly disarmed by the citizenry and militias of Boston and New York.

This familiar pattern of benign neglect repeated itself at the beginning of the 18th century. During that time, those few British units deployed to North America consisted of infantry or artillery companies garrisoning forts at Boston, New York, or Charles Town (present-day Charleston, South Carolina). It was not until Queen Anne's War (1702–1713) that the British government, prompted by American colonial agents, gave serious thought to dispatching sizable forces to North America. Foremost among the actions during the conflict was the 1711 Quebec expedition of Admiral Hovenden Walker. The attack floundered at the mouth of the St. Lawrence River that August, however. But the attack employed 4,500 veteran troops drawn from the Duke of Marlborough's victorious army. Thus, an important precedent had been set for deploying larger numbers of troops abroad.

Politically and institutionally, the British Army of this period bore only superficial resemblance to its contemporaries on the European continent, especially those of Absolutist France. The latter half of the 17th century imbued the English polity with an extreme distrust of standing professional forces for the potential tyranny they represented. The military was therefore kept small, counterbalanced by militia forces, and based on volunteer service rather than conscription. Impressment, however, could be invoked during national emergencies. As a rule, the enlisted ranks originated from the lower social orders and essentially joined the service to escape grinding poverty. Such was especially the case among Scottish and Irish regiments. The officer corps, by comparison, was indelibly aristocratic by nature and obtained its commissions through a purchasing system. But despite the vast gulf between officers and enlisted men, both worked well on the battlefield, and British officers were usually well regarded for the paternalistic care they afforded all ranks.

The basic tactical unit of the army at this time was the regiment/battalion, consisting of between 8 to 10 companies in the field and numbering around 400 men. The soldiers were bedecked in the famous coat of "double scarlet" and armed with a .75-caliber musket affectionately known as the "Brown Bess." After 1741, flank companies, one each of light infantry and grenadiers, were usually added to each regiment.

British troops trained under methods that can best be described as draconian, with regulations and disciplinary standards inspired by the fearsome and successful Prussian model. Good behavior off the field was also reinforced under the threat of flogging. However, misbehavior in the face of an enemy invariably resulted in a death penalty.

Such conditioning made the British a formidable force on the plains of Europe, but the heavily wooded environs of North America required new competence in scouting, screening, and skirmishing. For this reason, combat troops deployed to America had to be carefully retrained in these new skills. With time and experience, however, British light companies and regiments, such as those commanded by Colonel George Augustus, Lord Howe, that functioned entirely as light infantry, proved quite as adept as their colonial equivalents. By the advent of the French and Indian War (1754–1763), British armies in America more or less mirrored their colonial counterparts in terms of composition. They included engineers, artillery, and regular infantry. But they were further buttressed by provincials such as Rogers's Rangers, Native American warriors, and their own light troops. The British Army of 1763, previously a military establishment firmly wedded to prevailing European social and tactical norms, represented a generally successful adaptation to New World conditions.

The onset of further colonial conflicts such as the Anglo-Spanish War (1739–1744, also known as the War of Jenkins' Ear) and King George's War (1744–1748) witnessed the continuing deployment of regular soldiers in North America. Their primary purpose, however, was in stiffening local militia forces and the handful of colonial regulars (provincials) that existed at the time. Most of the fighting at this juncture, in fact, was done by Americans. Such was the notable case in the capture of Louisbourg in 1745. Nonetheless, British officers remained somewhat contemptuous of their New World colonists, despite growing signs of their tactical proclivities for the art of Native American–style bush warfare, or "skulking way of war."

The next round of colonial combat with France, during the French and Indian War (1754-1763), broke all precedents for the size and scope of British military and naval resources committed abroad. Beginning in 1755, when Major General Edward Braddock took 1,000 Redcoats of the 44th and 48th Regiments on their ill-fated expedition into the Pennsylvania woods against Fort Duquesne, Prime Minister William Pitt the Elder pushed successfully for the requisite manpower to decisively clinch victory in the New World. Consequently, thousands of British soldiers were transported across the Atlantic by the Royal Navy for service against New France. And, despite some awkward adjustments to frontier warfare on so vast a scale, they functioned bravely and became the principal instrument of victory in Canada. Higher echelons of leadership could be sadly deficient, however, such as Braddock at the Monongahela in 1755 or Major General James Abercromby at Ticonderoga in 1758. Yet even these crushing reversals in no way reflected on nor diminished the morale and fighting tenacity of the average British soldier. In fact, once abetted by the aggressive leadership of Major General James Wolfe, the army enjoyed one of its finest moments outside the walls of Quebec in 1759, dominating their French counterparts and winning a continent.

Meanwhile, thousands of Americans, both militia and provincial alike, were available to the British but were deliberately detailed to garrisoning, road construction, and other noncombat functions. British officers again evinced condescension toward them and their martial abilities. For their part, the Americans reacted negatively toward what they perceived as arrogance and insensitivity from their British allies.

Victory over France in 1763 and the acquisition of Canada held unforeseen consequences for both Great Britain and its military forces in North America. The government elected to maintain a force of 15 regiments in North America, a force totaling 8,500 men. Mainly, they were to garrison forts along the frontier. Such was a reasonable decision, considering the extent of territory to be guarded. After the violence of Pontiac's Rebellion (1763) was successfully contained, they were ordered to counter a wave of white encroachment on native lands in accordance with the Proclamation of 1763. Political authorities in London hoped such measures would forestall the outbreak of future hostilities with the natives, but Americans viewed this shift in responsibilities as the latest example of British capriciousness.

The British government, saddled with enormous wartime debts, also expected the colonies to contribute to the cost of maintaining the troops in North America through various taxes. The attempt to impose such taxes, universally reviled throughout the colonies, stimulated a paradigm shift in perceptions of—and attitudes toward—the vaunted Redcoats. In fact, they were increasingly seen as agents of tyranny and oppression, especially in the wake of illconsidered measures like the Quartering Act of 1765. This unpopular mission, while never mandating the quartering of troops in private homes, did require colonial assemblies to provide housing, food, and supplies at fixed prices to subsidize their presence. At one point, the New York Assembly was ordered to adjourn by Parliament until it voted to approve the necessary funding. These moves stimulated increasing militancy on the part of radicals, especially in Boston, where they resorted to mass civil disobedience. Their successful resistance to the Stamp Act and other revenue measures led to the deployment of the 14th, 29th, 64th, and 65th Regiments, drawn from the Halifax garrison, to raise the profile of royal authority in Massachusetts. Their presence, in turn, led to increased friction with the colonial public at large, who began deriding the soldiers as "Lobsterbacks" and "Bloodybacks." This was a complete change in attitude from the previous decade.

Great Britain's greater emphasis on a visible military presence was bound to spark an incendiary incident, which finally occurred on March 5, 1770, when a detachment from the 29th Regiment, violently assailed by an angry mob, fired on them, killing five. The

much-vaunted Boston Massacre was then famously propagandized in the engravings of Paul Revere, which served to further increase colonial resentment toward Great Britain and its army.

The spark that lit the fuse of revolution occurred in 1774, when civilian authority in Massachusetts, as represented by Thomas Hutchinson, was supplanted by Major General Thomas Gage, now both commander in chief and royal governor. Troop strength was also built up to nine regiments, with nearly 1 soldier for every 5 inhabitants. Furthermore, Gage meant business. Over the next year he dispatched occasional columns of infantry into the countryside to round up arms and other supplies belonging to the local militia. Such moves, while making perfect sense militarily, convinced the inhabitants that British soldiers were setting the stage for a military dictatorship. That line was fatally crossed on April 18, 1775, when Gage ordered a select force of 800 men to seize militia stores at Concord, Massachusetts. A day later, Gage's effort climaxed with bloodshed on the fields of Lexington, at which point the British Army, which had toiled so long and at such great cost to secure North America for England, won a minor skirmish—and lost a continent. Great Britain, Navy

By the 18th century, Britain's Royal Navy was the largest, best-equipped, and best-financed maritime force in the world. Naval supremacy matched a corresponding British commercial dominance on the seas. This navy possessed sufficient resources, both in ships and in sailors, to maintain both a highly effective defense of Britain and a system of trade protection in both the Atlantic Ocean and the Indian Ocean. British ships enjoyed bases on the coasts of India and in the Caribbean, as well as at Chatham and at Plymouth, where the Royal Dockyards produced massive ships of the line designed to carry the heaviest guns and hundreds of sailors. The creation and maintenance of such a fleet, combined with the great increase in demand for commercial shipping throughout the 1700s,

Comparative Naval Strength during the Colonial Era

made Britain the center of the global trade in naval stores such as timber and pitch from the Baltic region and from the North American colonies. The Royal Navy had also reliably produced a number of military heroes for British public consumption, including famous figures like Captain James Cook, but also some, like Admiral Edward Vernon in the 1740s, who were embraced by urban, patriotic crowds as populist or even reformist figures.

The early-modern British Navy owed its initial growth to Britain's involvement in the Continental wars of the 16th and 17th centuries. An island nation, England under Queen Elizabeth I and the early Stuart kings relied on its navy not for trade protection or exploration, but for the defense of the British Isles. The English fleet's destruction of the Spanish Armada in 1588 demonstrated the great strides English shipbuilders had made just in the latter half of the 16th century.

Influenced by Spanish and Portuguese ships that featured multiple masts and heavy guns, English designers created maneuverable, yet heavily armed ships that could both outpace and outgun their Spanish counterparts. The ships tended to be galleons or carracks. Guns aboard ship tended to be longer-range culverins, allowing the English ships to remain at a distance and outrange the Spanish guns. Similar craft, the forebears of the massive 18th-century warships, made up the standing naval force that had emerged by the middle of the 17th century. New types of ships emerged in sloops, brigs, frigates, and the great ships of the line—the line-of-battle ships because they could stand in the battle line that characterized fleet actions of the age of fighting sail. Neither

these vessels, nor the navy itself, played much role in the colonization of the Atlantic, however. Even after the establishment of colonial settlements in North America and in the Caribbean, the British government, ever watchful for the inexpensive alternative, employed "privateers" to harass Spanish and French commerce there.

The War of the Spanish Succession (1702–1713) did see the deployment of some Royal Navy ships in the Caribbean, a sign that the British government had begun to appreciate the value of the trans-Atlantic trade to its economy as well as the risk that the French and the Spanish posed to it. Yet despite this Caribbean venture, and some subsequent naval actions against Spanish settlements in Cuba and in Panama led by Admiral Vernon during the Anglo-Spanish War (1739–1744), the bulk of the navy remained in or near home waters.

Recent historical scholarship has largely debunked the idea that the bulk of the Royal Navy in the 1700s was occupied in protecting colonies or trade routes. However, the navy was so large in number of ships that it could maintain a large force at home and still keep some vessels stationed in Jamaica, for example. Even during the French and Indian War (1754–1763), when the navy's prime objective was the protection of the home islands, it retained sufficient capacity to capture French islands in the Caribbean, as well as to support the expansionist ventures of the East India Company in Bengal.

Of course, as N. A. M. Rodger, the Royal Navy's preeminent historian, has noted, this concentration of forces around Britain

did have an imperial dimension. By engaging and defeating European rivals on the European side of the North Atlantic, as it did in the case of the French in the Battle of Quiberon Bay in 1759, the navy was able to protect its smaller squadrons in the colonies and allow these ships to take on colonial rivals that now had no hope of reinforcements. Even the home fleet, then, played a part in imperial expansion.

It took an impressive fleet to carry out these multiple duties. In 1752, the Royal Navy possessed 132 ships of 50 or more guns and 159 smaller ships for a total of 291 of all classes. Nearly 100,000 officers and sailors manned and supported these vessels during the French and Indian War, and even more were added during the American Revolutionary War, as the major ships of the line by themselves required crews of 500 or more men.

Such a force was the result of a century-long effort at financing and supporting naval construction and maritime innovation. However, much of this initiative did not come from the Admiralty, which remained a fairly small, bureaucratic place through the late 17th and 18th centuries and provided a comfortable living not for great naval strategists, but for prolific diarists (such as Samuel Pepys). Instead, British naval supremacy grew from larger governmental patronage and support.

The later Stuarts were patrons of scientific research and the naval innovations that derived from it. In 1675, King Charles II funded the creation of the Greenwich Observatory, soon the location of the new meridian that would allow for the eventual calculation of longitude by the mid-18th century. Government investment in the fleet accelerated, however, after the Glorious Revolution of 1688–1689, when Parliament took firm hold of the nation's purse strings.

Successive governments improved and increased the collection of revenue from both land taxes and customs duties, part of the transformation of Britain into an efficient "fiscal-military" state. These growing revenue streams not only funded the growth of the Royal Dockyards and initiatives like the 1714 Longitude Act (offering a prize for the inventor of the best way to reckon longitude at sea), but also reassured and attracted investors in government-issued securities. Naval supremacy thus rested on a foundation of fiscal efficiency and solid credit. This was the background for continued innovation throughout the 18th century, including the invention of the chronometer by John Harrison, which solved the problem of determining longitude, and the growing use of copper plating on the hulls of warships by the 1760s.

Government revenues did not support an increase in the wages paid to Royal Navy sailors, however, and technological innovations in shipbuilding, armament, and navigation all far exceeded any improvements in shipboard life. Experienced seamen could earn far more on commercial vessels, and the navy, especially in wartime, relied on several techniques to fill out its crews. One was the offer of a cash bounty to sailors, but a more notorious practice was that of impressment by the Impress Service's gangs in port

cities. Although the introduction of citrus fruits into the sailor's diet did reduce the incidence of scurvy, life onboard ship remained full of hazards, including malaria, the possibility of drowning, and death in battle. Harsh discipline at sea, and its enforcement through corporal punishment, was another source of sailors' discontent, though there were few instances of true mutiny, such as a notable incident on the *Bounty* in 1789 and a much larger uprising in the Channel Fleet in 1797.

Conditions onboard reflected more than anything else the character and temperament of the man at the helm. Some commanders, such as Vernon and Cook, managed their crews well and with good result; others, such as Captain William Bligh of the *Bounty*, suffered for their tempers and their ill-treatment of those beneath them. A possible key to Cook's success was that, as the son of a Yorkshire farm worker, he had started his own career at sea as an apprentice sailor. Indeed, the Royal Navy offered much greater opportunity to non-elites than did the army, where the practice of purchasing commissions limited the range of officers' experiences. Promotion within the navy was often the result of political maneuvering or social connections, but unlike the army, there was the chance for men outside the gentry and aristocracy to obtain a commission—even the very slight possibility for promotion out of the enlisted ranks.

The Royal Navy's global reach grew immensely in the 19th century, as the empire expanded and as officials grew more comfortable with moving more squadrons away from the north Atlantic and the defense of home waters. This shift derived from the successes of the 18th-century fleet that had managed both to protect Britain and support colonial trade. With its continental rivals defeated, the Royal Navy emerged as the enforcer—and symbol—of British power around the world.

Great Swamp Fight

Start Date: December 19, 1675 End Date: December 19, 1675

Major battle of King Philip's War (1675–1676) that led the heretofore neutral Narragansett tribe to join King Philip (Metacom, Metacomet), leader of the Wampanoags, against the English colonists. In the fall of 1675, Philip's forces attacked and destroyed numerous colonial towns in southern New England. In short order his forces grew both in confidence and in numbers.

The large and powerful Narragansett tribe, situated in Rhode Island, was officially neutral. However, colonial leaders believed that some Narragansett warriors were secretly joining King Philip's raiding parties and that the tribe itself was harboring wounded warriors.

Determined to put an end to such assistance, the commissioners of the New England Confederation (Massachusetts Bay, Connecticut, and Plymouth) recalled most militia units from the western frontier. They also recruited new units, assembling the largest colonial force America had seen to that point.

The United Colonies placed the troops, drawn from all three colonies, under the overall command of Plymouth governor Josiah Winslow, with Major Samuel Appleton in charge of the Massachusetts men, Major William Bradford commanding the Plymouth contingent, and Major Robert Trent in charge of the Connecticut men. On December 9, 1675, Winslow's entire force, which numbered more than 1,000 men, marched from Massachusetts Bay toward the Rhode Island stronghold of the Narragansetts.

That year, the Narragansetts had decided to winter in a great fortification on the edges of the Great Swamp. The natives felt safe

there in their nearly completed fortification, especially as they knew that the English disliked fighting in the thick woods and swampy land that surrounded the stronghold.

On December 13, 1675, the majority of the colonial army gathered at Wickford, Rhode Island, on the outskirts of the Great Swamp. From there they spent several days attacking nearby native enclaves. The winter weather had made traversing the land easier for the militiamen, for it had stripped the leaves from the underbrush and frozen the otherwise swampy ground.

In one of these attacks, the colonists captured a warrior named Indian Peter, who promised to lead them to the Narragansett fort. After the delayed arrival of troops from Connecticut, Winslow decided that the time had come for the main attack. By then the army was running low of food and the winter conditions were already taking a toll.

On December 18, the colonial forces moved into the swamp, led by Indian Peter. They sighted their objective the next afternoon. The fort was constructed of wooden palisades with a mass of brush and timber around the base of the wall and small blockhouses at each corner. A sizable village of huts lay within the walls. At the time of the colonial attack, there were some 1,000 natives in the fort.

Without time to properly plan an attack, the vanguard of the colonial army rushed the fort. With incredible luck, they happened on a gap in the wall, although it was protected by a nearby blockhouse. Two companies rushed the opening and broke through, only to lose their captains and be forced back. As other troops rushed forward, they were able to break into the village and force the Narragansetts to fall back. The fight inside became a series of individual battles among the native dwellings.

Winslow, worried about the fierce fighting, gave the order to burn the fort to force the natives into the open. Winslow's aide, Captain Benjamin Church, tried to dissuade him, arguing that the colonials might use the fort for shelter after the battle was won. However, the militiamen began to burn the huts, with men, women, and children still inside. It was a scene reminiscent of the English attack on the Mystic Fort during the Pequot War of 1636–1638.

Soon, all the fort was afire. While some warriors escaped into the woods, many more natives—mostly women, children, and the elderly—died in the fire. Contemporary estimates of Native American dead ranged from 600 to as many as 1,000. The colonials lost 20 killed and some 200 wounded, about 20 percent of their force.

The colonials took quick stock and then prepared to move back to their base at Wickford. The weather was turning worse and now that the fort and its dwellings had been destroyed, there was no place to shelter the men, especially the wounded. They quickly fashioned stretchers and began the overnight march to Wickford. The retreat was difficult and conditions sharply deteriorated with the arrival of a winter storm. It was especially difficult for the wounded. The colonials also feared a Narragansett counterattack.

By the time the colonials had reached Wickford early the next morning, a number of the wounded had died. Within a month, the toll of the dead had risen from 70 to 80. Losses were especially high among the officers. Half of the 14 company commanders perished. While the campaign was considered a success, this came at a heavy price.

In retrospect, it is questionable whether the campaign was actually successful. Before the attack, the Narragansetts were officially neutral. While the colonials had dealt the Narragansetts a terrible blow, the tribe's survivors, determined to exact revenge, now made common cause with King Philip.

Grenadiers

Grenadiers were specialized infantry, developed in European armies as assault troops for siege operations. Their name was derived from the use of grenades as an offensive weapon to breach fortifications. The grenades consisted of hand-sized round shells filled with gunpowder and touched off by fuses. Grenadiers were selected from the strongest and tallest men, for they had to be able to throw the grenades the greatest possible distance. Such men also had to be able to remain steady under enemy small-arms fire. Once they had lit the fuses and then thrown the grenades, the grenadiers would assault the enemy fortification.

Grenadiers wore specialized uniforms to assist them in accomplishing their missions. The grenadier regiments adopted a bishop mitre-type headdress to enable them to sling their muskets and throw their grenades without being impeded by wide-brimmed headgear. Their headdress was usually decorated with regimental badges. Grenadiers also wore special belts for carrying fuses and received the newer models of flintlock muskets. Grenadiers were considered among the elite formations within European armies.

Austria and Spain were some of the first European countries to employ these specialized soldiers in combat. King Louis XIV of France (1643–1715) made the grenadiers a special infantry branch. By 1670, the French Army had a number of grenadier or shock troops within its regiments. By 1677, the British Army had their first grenadier company within the 1st Foot Guards.

Throughout the 17th century, many countries created grenadier companies to go along with the development of siege warfare on the European continent.

In the 18th century, the desire for grenadier units led to the creation of grenadier battalions and regiments. King Frederick William I of Prussia (1688–1740), whose one extravagance seems to have been tall soldiers, created a special unit of "Giant Grenadiers," individuals nearly seven feet tall. Grenadier units were more expensive to maintain than regular infantry and in the case of Prussia, three grenadier battalions cost as much as nine battalions of regular infantry. To reduce costs, grenadier companies were assigned to regular infantry regiments for service in the field. The cost of these units did not prevent wealthy officers from creating their own grenadier units.

In several conflicts, grenadiers were used as "heavy infantry" to assault and carry enemy fortifications. Such units were temporary organizations created for specific campaigns. In 1759, British major general James Wolfe created a special corps of grenadier companies from the 22nd, 40th, and 45th regiments for the Quebec campaign. Generally speaking, in North America these heavy units were unsuited for the mobile combat found in the forests of the continent.

The name grenadier is still used for military units, but more as an acknowledgment of their elite status. An example is the Grenadier Regiment of the Indian Army, which traces its lineage back to the grenadier companies of the Bombay Sepoys at the Battle of Talegaon, India, in 1778.

Grey Lock's War

See Dummer's War

Gridley, Richard

Born: January 3, 1710 Died: June 21, 1796

Colonial artillery officer and military engineer, later a British Army officer. Born in Boston, Massachusetts, on January 3, 1710, Richard Gridley began his young adulthood as a wholesale merchant. Dis-

satisfied with his trade and naturally drawn to mathematics, he became a surveyor and then a civil engineer. Gridley soon joined the Massachusetts Militia and became a protégé of John Henry Bastide, a British Army officer. Under Bastide, Gridley mastered the essentials of artillery tactics and military engineering.

In 1745, during King George's War (1744–1748), Gridley commanded the artillery train in the successful colonial Louisbourg Expedition. He was immediately advanced to the rank of captain in Massachusetts governor William Shirley's regiment. In early 1746, Gridley assumed the task of fortifying the defenses of Boston harbor. Six years later he constructed Fort Western and Fort Halifax in Maine. Gridley served in the French and Indian War (1754–1763) as a colonel in Sir William Johnson's regiment until Major General Jeffery Amherst gave him command of all provincial artillery in 1758. He performed well in his new position and played a crucial role in both the 1758 Siege of Louisbourg and the 1759 Battle of Quebec. For his services to the Crown, at war's end Gridley was awarded a colonel's commission in the British Army. He also received a grant of the Magdalene Islands (Gulf of St. Lawrence), 3,000 acres of land in New Hampshire, and appointment as chief engineer in New England's provincial army.

On the beginning of the American Revolutionary War, both sides courted Gridley, but he joined the Patriot cause and assumed the post of chief engineer of Massachusetts and command of its artillery regiment. He laid out the defenses for Breed's Hill and was wounded in the Battle of Bunker Hill. In September 1775, probably having more practical experience in handling of artillery than any other native-born American, Gridley assumed command of the Continental Army's artillery as a colonel. Soon thereafter, however, Gridley lost his post as chief of artillery to Henry Knox, a man considerably younger than he and a favorite of Continental Army commander General George Washington. Gridley retained his position as chief engineer, however. He played an important role in the siege of Boston in carrying out the fortification of Dorchester Heights. In 1776, Gridley became engineer general of the Eastern Department. He held that post until his retirement in December 1780. Gridley died in Stoughton, Massachusetts, on June 21, 1796.

Guales

A group of numerous indigenous communities that lived on the coast and coastal plains of eastern Georgia. Together, the Guale set-

tlements formed a confederation led by a single king. The name Guale may have been a derivation of *wahali*, the Muskogee word for "the South." Prior to European contact, the Guales were strictly hunter-gatherers. When the French briefly settled in northern Florida, they called these people Ouades. However, French settlers in North Florida did not live in the area long enough to build significant relationships with the Guales, and thus the name the Spaniards gave the community has endured.

In 1566, Jesuit missionaries from Spain entered the region determined to spread their faith among the coastal towns of the Guales. To transform the Guales into reliable Catholics, the missionaries had to effect significant cultural changes. In particular, the Jesuits objected to the Guales' practice of polygamy and found the community's constant movement between hunting and gathering grounds an obstacle in their efforts to exert control over the region.

After six years of attempting to change the Guales, the Jesuits left the area having converted only six individuals. In 1572, Franciscan missionaries returned to continue working with the Guales, but this time Spanish soldiers accompanied the missionaries. Although the Franciscans brought only a few soldiers, the military presence created tensions between the two peoples.

As with the Jesuits before them, the Franciscans believed that the Guales had to adopt sustainable agriculture, an innovation the Guales had previously showed little interest in adopting. But the missionaries insisted on the change. Agriculture assured the missionaries a constant food supply for themselves, and kept the Guales tied to the land and within earshot of the church bells or demands of the friars. Attempts to alter Guale society did not bring the community closer to the Spaniards and their faith, however.

In 1597, the Guales violently rejected Spanish overtures. In a revolt that lasted several days, Guale warriors killed five of the six Franciscan missionaries and destroyed a chain of Catholic churches and missions that lined the Georgia coast. For the Guales, victory came at a steep price. By 1598, the Spanish returned to the area, punished those who participated in the revolt, and continued their efforts to transform Guale society and religion.

This time, the Catholics made significant gains in their efforts to convert the Guales. By 1602, the Franciscans recorded more than 1,200 conversions. In addition, the Spanish government in Florida increased its political control over the Guale territory.

Spanish inroads proved so effective that by the 1660s many Guale warriors were forced to help construct the Castillo de San Marcos in St. Augustine. In addition, the Spaniards also forced Guale warriors to participate in local militias. As the Europeans assumed greater control over Guale life and culture, Guale communities began to disintegrate. Eventually, by the late 17th century, a clearly defined, independent Guale culture ceased to exist.

Gun Merchant of Okchai

Born: Unknown Died: ca. 1770s

Leader of the Abihka (proper name Enotonachee) town of Okchai, who acted as one of the headmen (Mico) in the Upper Creek Confederacy, about 1746–1775. Prior to the mid-1740s, Lower Creek headmen from the Cowetas had taken the lead in Anglo-Creek diplomacy, but a British-Coweta dispute over Mary Musgrove's land claims cooled the relationship. As a result, Upper Creek influence grew. The Gun Merchant benefited from this shift in British attention, and would remain a major figure in Anglo-Creek relations until well after 1763.

The Gun Merchant continued the Cowetas' policy of neutrality toward European powers. During the French and Indian War (1754–1763), he refused to make war on either French or British settlements. This was a difficult position to maintain, however, as the Gun Merchant's brother-in-law, the Mortar of the Okchai, continually courted the French in an effort to draw the Creeks into an anti-English alliance, during both the French and Indian War and Pontiac's Rebellion, which immediately followed in 1763.

In addition to maintaining Creek neutrality, the Gun Merchant made equity in the deerskin trade a top priority. He made peace with the Cherokees in 1749, and learned from them that Cherokee deerskins fetched better prices from British traders. Thus, he pressed the British for more favorable prices, and in 1756 went so far as to promise Creek territory for a British fort if trade prices were adjusted. His people rebuffed the fort plan, costing the Gun Merchant some prestige, but he nonetheless used his influence in an effort to preserve Creek neutrality during the American Revolutionary War until he died sometime in the late 1770s.

Gyles, John

Born: ca. 1679 Died: ca. 1755

English colonist taken captive by Abenaki warriors during King William's War (1689–1697). John Gyles was born around 1679 and was captured by the Abenaki Indians in 1689. On August 3, 1689, an Abenaki war party attacked Pemaquid, Maine (then part of Massachusetts), overpowering its small garrison and taking some 20 captives, including 6 members of the Gyles family, John among them. He spent the next six years as a prisoner among the Abenakis, where he adjusted to the realities of his captivity. By the time the Abenakis sold him to a French Acadian merchant in 1695, John's mastery of the Abenaki language and customs made him a valuable asset to his French master. In 1698, soon after the war ended, he returned to Boston.

Despite the travail of his time in captivity, Gyles used the skills he gained in the wilderness to make a life for himself on his return to New England. Thus, he served as an interpreter and negotiator for Native Americans on the Maine frontier, eventually becoming commander of a garrison on the St. George's River. In 1736 he published an account of his nine-year captivity, which stands as one of the most interesting and detailed works in the early American "captivity narrative" genre. Gyles died around 1755.

Haigler, King of the Catawbas

Born: ca. 1700 Died: August 30, 1763

Leader of the Catawba Nation (1750–1763). Born about 1700, most likely at the ancient Catawba ceremonial center at Pine Tree Hill (modern-day Camden, South Carolina), King Haigler reportedly spoke some English in private but refused to speak English in conference, relying instead upon interpreters. As a child he may have been one of the dozen or so hostage students at Fort Christanna. The government of Virginia decided that some Native American children would be "civilized" yet they were held as hostages to ensure compliant behavior by their parents. Haigler's English may have come from this experience.

Haigler became king in the autumn of 1750. His predecessor, King Young Warrior, and most of his headmen were murdered by a group of Iroquois as they traveled to Charles Town (modern-day Charleston). Haigler, out hunting, was the only headman left to the Catawbas and became king by this accident of history.

As king, Haigler's first task was to end the genocidal war between the Catawbas and the Iroquois. The situation had indeed become so dire that the Catawba men were afraid to venture from their village to go hunting. To accomplish the desired results, King Haigler traveled by ship from Charles Town to New York. From New York he traveled up the Hudson River to Albany, then a frontier post. He was accompanied by Gov. James Glen of South Carolina and six of his headmen. At Albany he successfully negotiated a peace treaty with the Iroquois.

In 1757, King Haigler became involved in the French and Indian War. Supporting the English against the French, he led a band of his

men to Fort Duquesne. Back home in 1760, he negotiated the Treaty of Pine Tree Hill. In this now-lost document, King Haigler reserved for his people only two million acres of the estimated original 50,000 square miles of Catawba land, ceding the remainder to the colonists. He also agreed to abandon the Catawba ceremonial center of Pine Tree Hill and relocate the nation to Kings Bottoms in Lancaster County, South Carolina. Nonetheless, North Carolina authorities were not pleased with the apparent "generosity" of South Carolina in allowing such a large Native American reservation and because the border between the two Carolinas had not yet been delineated and some of the reservation land lay within present-day North Carolina.

On August 30, 1763, King Haigler was attacked and killed by a Shawnee war party. Several months later, the Catawbas, ruled by a regent, traveled to Augusta, Georgia. The Catawbas agreed to a further reduction of their land base to 144,000 acres centered at their sacred ground at Kings Bottoms between Lancaster and York counties, South Carolina. Catawba claims to this same 144,000-acre reservation became a thorn in South Carolina's side for 230 years. The land issue created by Haigler finally ended with a settlement in 1993.

A wealth of material has been preserved on Haigler, mostly in papers preserved in South Carolina. Thinking far ahead of his time, at one point King Haigler begged the colonial governments to prohibit the sale of liquor to his people. On another occasion, he made an eloquent speech on the worth of women. Today, King Haigler is memorialized by Catawba potters who continue to make pipes in his honor, although no true portraits of him survive. If the pipes are attached as lugs to a large jar, the vessel is known as a King Haigler pot.

Haldimand, François-Louis-Frédéric

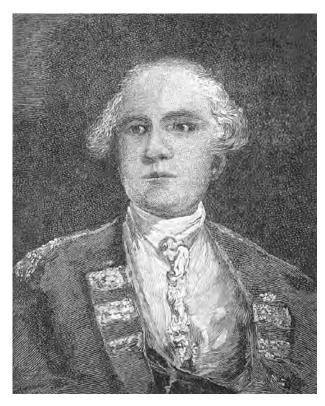

Born: August 11, 1718 Died: June 5, 1791

British Army officer and colonial governor of Quebec (1777–1786). Born at Yverdon, Switzerland, on August 11, 1718, François-Louis-Frédéric (later anglicized to Frederick) Haldimand began his military career at a young age, serving with Prussian forces during the War of the Austrian Succession (1740–1748). After the Peace of Aix-la-Chapelle in 1748, Haldimand transferred into the Swiss Guards Regiment of the Dutch Army. He eventually attained the rank of captain commandant.

In 1755, a fellow countryman, James Prevost, persuaded Haldimand to immigrate to North America. Haldimand was lured by potential service as a field officer in a proposed foreign Protestant colonial regiment to be raised in Pennsylvania by the British government. In 1756, he was officially commissioned a lieutenant colonel in the British Army in the 2nd Battalion of the 60th Foot (Royal American) Regiment. His affiliation with it continued for the next three decades.

Haldimand arrived in New York in the early summer of 1756 during the French and Indian War (1754–1763). His diligence contributed greatly to the regiment's early training and preparation for service. He took command of the 4th Battalion in 1758 and led it that same year in the unsuccessful British assault on France's Fort Carillon (Ticonderoga), where he was wounded. A year later, he commanded the same unit during Brigadier General John Prideaux's advance against Fort Niagara. His eight companies formed the expedition's rear guard that took station at Oswego. Their successful defense of the site on July 5–6, 1759, permitted British forces to continue the siege of Fort Niagara, which surrendered a few weeks later.

Haldimand's constancy was widely respected at New York headquarters, leading to his promotion to colonel in America in 1758 and colonel in the regular army in February 1762. He led the advance guard of Major General Jeffery Amherst's western army that swept down the St. Lawrence River, arriving at Montreal in early September 1760. The capitulation of that place on September 10 marked the fall of New France. Haldimand was honored with command of the grenadier party, which was the first to hoist British

colors over the city's battlements. He then served as liaison with the French authorities, helping to arrange for the evacuation of French civil and military personnel.

After the war, Haldimand was naturalized by parliamentary statute and continued to enjoy the confidence of imperial officials. Promotions to both military and civilian offices followed. Haldimand's subsequent appointments included brigadier general in command of the Southern Department (1767-1773) with headquarters at Pensacola. He was promoted to major general in 1772 and served as acting commander of British North American land forces (1773-1774) while Major General Thomas Gage was in England. Haldimand's patience during the time of the Boston Tea Party helped to prevent outright hostilities. Although he perhaps had the most experience in America of any British officer and enjoyed the respect of his fellow officers and the civilian authorities, he was recalled to England at the opening of the American Revolutionary War because London thought it best to have someone of English birth in command. In September 1775, he was given the post of inspector general of British forces in the West Indies.

On the resignation of British major general Sir Guy Carleton in the summer of 1777, Haldimand was sent to Quebec as his replacement. His native knowledge of French, his honesty, diligence, and his innate good sense helped in dealing with the large French Canadian population. Haldimand improved the defenses of the province and inaugurated a system of canals on the upper St. Lawrence River and provided for Loyalist refugees from the revolting colonies. In 1784 he returned to England. He was knighted a year later. He traveled frequently to his birthplace and developed a small estate on Lake Neuchatel that he had purchased in 1776. Haldimand died at Yverdon on June 5, 1791.

Halifax (Nova Scotia)

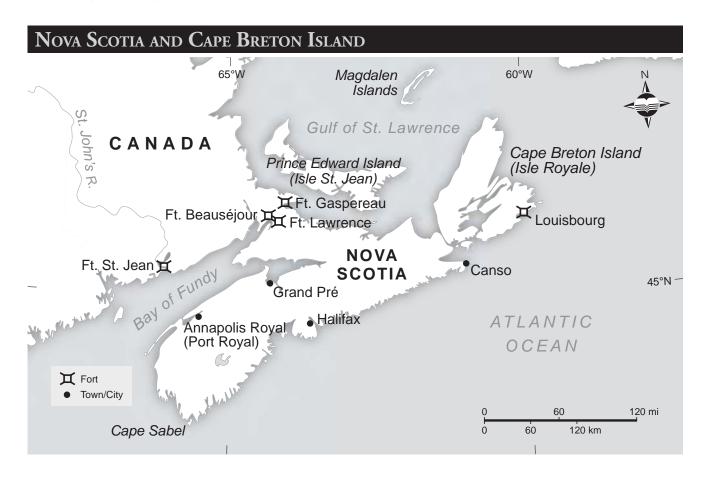

English settlement founded in 1749 on the Halifax Peninsula, located in Nova Scotia in eastern Canada. On orders of the British Board of Trade, a colony was established there in 1749 in an effort to counter the French presence at Louisbourg on Cape Breton Island and to ensure a Protestant population in what was a Roman Catholic Acadian stronghold. At the same time, the colony was to secure English access to the cod fishery. Approximately 2,500 British soldiers, settlers, and laborers arrived in the summer of 1749 under Colonel Edward Cornwallis.

This was Britain's first attempt to secure its presence on lands acquired from the French under the terms of the 1713 Treaty of Utrecht. Initially named after the bay known as Chebucto (derived from the Micmac word meaning "chief harbor"), the settlement was soon renamed Halifax in honor of George Dunk, Lord Halifax, president of the Board of Trade.

A citadel, subsequently constructed on the highest point, served to dominate both the harbor and the settlement. The citadel underwent four major periods of building and improvements during 1749–1750, 1776–1781, 1795–1800, and 1828 forward. Halifax

soon became known as the "warden of the North," because of its primary function as a garrison and naval installation.

Cornwallis quickly faced hostility regarding his plans for the community. The settlers, initially more interested in acquiring title to their lots and building habitations before winter set in, were uninterested in working on town defenses. To settle land disputes, Cornwallis held a free lottery to allocate lots across the Halifax Peninsula. Nevertheless, most of the settlers failed to construct adequate shelter for the winter.
